A. I believe that such a study could be set up. Of course, we have not discussed the rules under which it would be set up, and so a fellow would have to be pretty careful about how valid it was until he knows more about the specifications for this adjustment.

Q. You mean, you would like to know how much money you get first, before you can tell whether it is a good method?

A. No, I would like to know what adjustments you were going to make and on what basis.

Q. You have no criticism to offer at this time of such a method—withdraw that—there are sufficient figures in your exhibit, are there not, on which to work out such a sixth method?

A. We have sufficient statistics here to work out almost any number of methods and the answer to your question is "yes".

[fol. 3140] Q. And without first working it out, you would not want to express an opinion as to whether such a method would be good, bad, or indifferent?

A. I have a natural curiosity, as you do, about just what adjustments you are going to work into this thing.

Q. Well, there would not be much of an adjustment to it. It would be your adjustment, the 80 over 125 adjustment that you use in your fourth and fifth methods. Is there anything wrong with that?

A. Now, you are getting specific. When you do that, do you propose to compare such adjusted Max. Day to the full investment that existed during those periods? In other words, you have two apples, are you going to chop one up before you compare them?

Q. I am asking you whether, in your opinion, it would be proper to do a sixth method using your own figures as the basic data and using your own adjustment?

Now, I am not a rate engineer. I am asking you what you think about the matter. That is one good thing about being a lawyer in these proceedings. We do not have to express our opinions until later.

A. You have used the phrase, "and using your adjustment". I have made dozens of them here, so that isn't a sufficient description of the adjustment that you would use to enable me to give you a good answer.

[fol. 3141] Q. Have you ever computed a method of calculating interest, ad valorem taxes and operating expenses attributable to unused capacity which method was called the "ratio of investment method"?

A. Not that I recall.

Q. Do you remember ever using such a method and getting a figure of $3,400,000 which would logically be shown in Column G?

A. I have made studies that yielded figures larger than those shown in Column G, and I have seen one, or recall a figure pretty close to $3,400,000 that I worked out on some preliminary study.

Q. Did you submit that one to Mr. Biddison for his examination?

A. I do not know that Mr. Biddison ever saw that one. I just do not know. I do not believe he did.

Q. You do not believe you did?

A. No.

Q. Did you submit it to Mr. O. J. Neuner?

Mr. Wheat: Don't you mean, G. J. Neuner? Maybe the carbon copy you have before you isn't as good as the one I have.

The Witness: I recall writing Mr. Neuner a memorandum in which I discussed some of my preliminary studies, yes, and from your refreshing my memory, by reference to this memorandum, I feel sure you will find the figure $3,400,000 on that memorandum referring to some preliminary [fol. 3142] study I made in connection with this cost of unused capacity.

By Mr. Littman:

Q. Do you have a copy of that letter?

A. I do not have a copy with me.

Q. The letter to which I refer or memorandum which I refer to is dated August 19, 1941. Is that the one you have?

Mr. Wheat: August 19, 1941. I will be very glad if you would like to have this marked as an exhibit—

Mr. Littman: (Interposing) We will handle this matter as we see fit.

By Mr. Littman:

Q. Read the copy that Mr. Wheat handed you, if you will, and state whether or not that is a correct copy of your memorandum? A. That is.

Q. That is a memorandum dated August 19, 1941, addressed by you and written by you to Mr. G. J. Neuner, is that correct? A. That is correct.

Q. Now, will you please read that letter into the record?

A. (Reading) "August 19, 1941

(To) Mr. G. J. Neuner

(From) G. W. Morton

"It is quite apparent that there was unused capacity in [fol. 3143] the system prior to the Fall of 1936. This is illustrated by the fact that Gross Earnings for the period October 1, 1936 to September 30, 1937, were $9,318,459 whereas earnings for prior periods were:

Nine Months 1932 (April 1—December 31)	$1 427 494
1933	2 585 397
1934	3 048 518
1935	3 611 865
1936	3 611 865
1936 (January 1st to October 1st)	3 786 273

"Since earnings for 1935 (for example) are 38.8% of $9 318 459, we might say that only 38.8% of our investment was used and useful during 1935 and, therefore, the balance of the investment amounting to 61.2% (which had been made in advance of the time when it was to be used because it was economical to do so) was not useful in producing revenue for the company. It would seem logical,

therefore, to recognize in some way, that fact that during 1935 taxes, interest and certain operating expenses and other charges were incurred by the company on account of this 'unused capacity which had been installed prior to the time it was needed because it was economical to do so.'

"In the Chicago case these items were put in as 'going value.' Mr. Hamilton's presentation was based upon the ratio of earnings during a fully loaded year to the earnings during the unloaded years and Mr. Emery's determination [fol. 3144] was based upon the ratio of the gas delivered during those years. The amounts were practically the same. Certain adjustments had to be made by Hamilton and Emery and will have to be made in our case to rationalize the presentation.

"It happened that before the Chicago line was loaded (and in our case too) the company made some additional investment in order to fully power the line. It was obviously not logical to make a direct comparison between loaded and unloaded periods without making some adjustment for the additional investment that had been put into the loaded line. The capacity before loading was 175 MM per day. The capacity after loading was 210 MM per day.

"Accordingly, Hamilton and Emery adjusted the earnings for a loaded year before making any comparisons. They took the earnings or MCF during a loaded year and reduced them by 35/210ths in order to get a base for comparison with former unloaded years. Or putting it another way, they multiplied earnings or MCF during a loaded year by 175/210 in order to reduce the loaded year to a proper base for comparison with former unloaded years. In explanation of this adjustment, they pointed out that the line carried 90% of its full capacity on an average day during the loaded year and that the use of their factor 175/210, merely embodied the assumption that the line would have carried 90% of its full capacity on an average day during the time the capacity was 175 MM if a full 175 [fol. 3145] MM maximum day load had been realized during the unloaded years. Perhaps, if instead of the use of such a factor as a basis for adjusting a loaded year to arrive at a base, they had assumed a base annual earning or MCF delivery during each of the lean years bearing the same relation to the 175 MM as the annual MCF or

earning during the loaded year bore to the maximum capacity of 210, the comparison might have seemed simpler. Mathematically the answer is the same. With such variations as seemed necessary I have applied the methods described to our situation.

"It happens that we transported considerable quantities of gas for the account of Northern Natural Gas Company during the early years at an average rate, over the entire period, of 1.5¢ per MCF. In the development of unused capacity values I have eliminated the MCF and the Revenues from this source because the property, as built, did not contemplate such a load, as is evidenced by the size of the Hugoton line and during the loaded period (Sept. 1936 - Sept. 1937) no gas was transported for account of Northern Natural Gas Company. To be consistent, I have also eliminated from Unused Capacity that portion of the main line and Liberal compressor station and investment used in carrying this gas. Likewise, I have eliminated Argus and Local Area earnings investment and MCF because our whole story is tied to Main Line Capacities.

"There are several approaches to the problem. For example, we might take the investment during the loaded [fol. 3146] year ($51,393,417) and apply the ratio 80.125 to it and by comparing this figure with the actual investment during the 'unused' years obtain a measure of investment in unused capacity. This method yields a measure of investment in unused capacity. This method yields a 'going value' of approximately $3,388,000 before depreciation and contributions. A summary of the roughly approximate amounts obtainable before depreciation and contributions, by the three methods is as follows:

Ratio of Revenue Capacity	$5,700,000
Ratio of Sales Capacity	5,400,000
Ratio of Investment	3,400,000

"I have reduced this to writing partly to clarify my own arguments and partly to supply you with additional information to assist you in coming to a conclusion as to the most logical method for us to use in arriving at 'going value'.

"(Signed) O. W. MORTON"

Q. Now, Mr. Morton, referring to the "ratio of investment" method whereby you arrived at a sum of $3,400,000, with whom did you discuss that method?

A. I discussed that method with Mr. Neuner. I do not know, I may have even discussed it with Mr. Biddison. I cannot remember who was present at all of the many conversations and meetings that we have had on the subject of preparing for this rate case.

Q. Who turned thumbs down on the ratio of investment [fol. 3147] method?

A. That I do not know.

Q. Somebody did, evidently, because you did not use it.

A. I may have turned it down myself and I rather think I did.

Q. Didn't it give you enough going concern value, Mr. Morton? Is that why you turned it down?

A. What is enough going concern value?

Q. Well, Mr. Biddison thinks he ought to have at least [illegible] million dollars of it. I suppose that would be his idea of what would be the amount. Is that why you turned it down?

A. No, I suspect that, in working this out, there was some logical reason for turning it down, some reason other than the one you have mentioned.

Q. But you do not recall it now?

A. But I do not recall it now.

Q. You take a very active part, do you not, in designing the rates and tariffs under which Panhandle Eastern Pipe Line Company sells gas, do you not?

A. Yes, I do.

Q. When the company designed the rates and tariffs under which it now sells its gas, were those rates designed to include a return on going concern value?

A. You are referring now to a large group of rates?

Q. Any of them or all of them.

[fol. 3148] A. With any of them, which one?

Q. The ones with which you had something to do and have personal knowledge of.

A. I do not recall that going concern value was discussed one way or the other in the last provision of the rates in which I participated.

Q. Well, you made calculations and computations in arriving at the rates, did you not?

A. Mr. Littman, your question presupposes that we can sit down and just grind out, at the desk, exact costs and then just reduce that to a rate schedule and file it.

Now, as a matter of fact, in the development of rates there are many, many factors that have nothing to do with the cost of delivering the product.

For example, customer acceptance. You do not want a rate that is so cock-eyed that nobody would buy gas under it. I am trying to answer your question. I am trying to point out to you that you cannot reduce rate making to a mathematical formula in which you just sit down and you say, "This item is for this; this item is for this; this item is for going value", and so on.

I have not been able to identify going value, as such, in any of our rates.

Q. Then you have no recollection of ever predicating a rate on behalf of Panhandle Eastern Pipe Line Company [fol. 3149] over your ten years as a rate engineer upon any so-called going concern value, to the best of your knowledge?

A. I recall that in setting up the rate in Illinois, that one of the elements that entered into that—it was way back in 1931—when we had our little run-in with the Illinois Commerce Commission and made a showing before them on a new rate we were trying to put into effect—one of the elements in that rate was going concern.

Q. That was in a proceeding before the Illinois Commerce Commission? A. Yes; that was.

Q. Do you recall of any other instance?

A. No, I do not recall that subject coming up in connection with the rates which we have on file now.

* * * * * * * *

[fol. 3150] By Mr. Littman:

Q. Mr. Morton, will you please turn to your exhibit No. 40, entitled "Panhandle Eastern Pipe Line Company Sys-[fol. 3151] tem Estimated Main Line Sales—Years 1941-1946, Inclusive."

As the title indicates, Mr. Morton, in this exhibit you have set forth your estimate of main line sales of the

Panhandle Eastern Pipe Line system for the six years 1941 to 1946, inclusive, have you not?

A. That is correct.

Q. The sales shown in Column C for 1941 are actual for the first six months and estimated for the last six months of the calendar year, are they not?

A. Yes, they are.

Q. And the total for 1941, as shown in Line 26, is 62,057,500 M. c. f., is that correct?

A. That is correct.

Q. What pressure base did you use for the volumes of gas shown in this exhibit?

A. We customarily carry on our statistical reports M. c. f. sales in terms of the base at which they were actually sold and my estimates are prepared on the same basis.

That is to say, that some of them are one base, and some another. Predominantly, they are the standard with which you and the Commission are most familiar with, 30 inches saturated.

Q. Is that the same as 14.73 tmosphere? A. It is.

Q. Do I understand that it is your conclusion that the gas sales of the system will not remain at the 1941 figure [fol. 3152] of 62,057,500 M. c. f., but that they will increase in the succeeding years 1942 to 1946, inclusive, and in the total amounts shown in Lines 26 and 27 of your Exhibit 40?

A. That is correct.

Q. Now, looking at the top of your Exhibit 40, you show the sales in M. c. f., both annual and maximum day for Detroit. Does that mean the City of Detroit or does that mean the entire Detroit area?

A. That means the area which we commonly refer to as Detroit, being that area served by the Michigan Consolidated Gas Company.

Q. It includes the City of Detroit?

A. It includes the City of Detroit and vicinity.

Q. And environs of the city. Now, in Line 3, Column D, you show the estimated sales to Detroit for the year 1942 to be 27 million M. c. f., an increase of 3 million M. c. f. over 1941, do you not? A. That is correct.

Q. What part of the 27 million M. c. f. represents increased sales to the presently connected burner tip customers?

A. Now, I do not have that broken down between increases to the presently connected customers and the new customers which we expect will come on to our lines.

Q. In making your estimate, you did not make any such determination?

[fol. 3153] A. I made no such distinction between customers, yes, sir. In other words, these are the increases, whether or not it comes from the existing customers or comes from new customers that might be added to their systems during the year.

Q. Do I understand then, that you arrived at your increase of 3 million M. c. f. between 1942 and 1941 on an over-all basis, without making any breakdown or distinction between customers?

A. I am looking now at Work-Sheet No. 1, which gives the total for Detroit, all the details that I have used in the preparation of this estimate.

I see that at the end of 1941, there were 48,000 house heating customers and, at the end of 1942, I estimate there will be 10,000 more, which is 58,000 house heating customers and that the average for the year 1942 will be 53,000 house heating customers; that the total consumption of all house heating customers that will be connected, whether they are new ones or old ones, the total consumption of the combined group will be 86 million therms, or approximately 8,600,000,000 cubic feet.

I show on that work sheet also, that the remainder of the gas to be sold to Detroit for resale for purposes other than house heating will increase from 170 million therms this year to 184 million next year.

Q. What is that, 174 million—

A. (Interposing) 170 million therms to 184 million [fol. 3154] therms, which is approximately 17 billion cubic feet this year to 18,400,000,000 next year, but those figures are not segregated as between old and new customers.

The addition of the two quantities of gas which I have named, namely, 8,600,000,000 and 18,400,000,000 gives us

our figure of 27 billion cubic feet which is shown as next year's estimate.

Q. Can you enlighten us as to how you arrived at these increases? You merely told us that, in your opinion, there would be increases, if I correctly understand your testimony thus far. A. That is true.

Q. Can you enlighten us as to the method you used to arrive at that?

A. Yes, I would be glad to give you the background of that and this is essentially the method you will find running through this entire exhibit.

I keep separately statistics on Detroit, the number of house heating customers by months. I can go back five years, by months, and indicate and show you very quickly how many house heating customers Detroit has so I know from the past performance about how many new house heating customers will be added to the line for each year and for the last three years, it has been about 10,000 house heating customers added each year.

I just assume we will add 10,000 more next year, and that [fol. 3153] the next year will be just like the past two or three years. I keep a record of the house heating consumption, or the consumption per house heating customer, rather, in Detroit.

I keep myself informed on such matters. I use that information in predicting how much they are going to use next year. In brief, the past history is my best aid in estimating the future consumption in all these cases.

Trial Examiner: That statement does not, however, apply to the estimates included in Line 8, does it? There you seem to have some arithmetical progression.

. . . . . .

The Witness: No, you cannot be too specific in laying down your rules on how you go about this estimating. For example, in Line 8, that reflects a great deal of new business, new customers.

Specifically, those to be added in Pontiac, Flint, and Saginaw and all that whole Michigan peninsula.

. . . . . .

The Witness: Under the Consumers' contract so that, of course, we would have to handle that a little differe than the way we did Detroit, because we do not have five years' history on those folks.

Trial Examiner: While you are on Line 8, explain the large increase indicated between the years 1945 and 1946.

[fol. 3156] The Witness: The estimator judges that between the year 1945 and 1946 that local gas up there in Michigan is going to play out and we will have to pick up the whole load instead of a large part of the load that we will be carrying up until 1945.

In other words, the sudden increase is due to the fact that they are running out of gas up there.

By Mr. Littman:

Q. Well, your working papers do not show the basic data that you used in making your assumption as to increased load which you described, do they, Mr. Morton?

A. I think they use the basic assumptions.

Mr. Wheat: You mean they include—

The Witness: (Interposing) I think they include the basic assumptions used because I show there on that working sheet the total sales in 1937, '38, '39 and '40, and I would say that that is basic data for estimating the following years. That is pretty good basic data, it seems to me.

Mr. Lee: May I ask a question?

Mr. Littman: Surely.

Mr. Lee: Are these prophesized increases predicated upon present gate rates under the present contract?

The Witness: Yes, I have, you might say, been forced by circumstances to assume a continuation of the present rate levels in my estimates because I would have no [fol. 3157] grounds whatsoever of supporting any other estimate that I might base it upon.

For example, if I said to you that these estimates are based upon a 10 percent reduction or a 10 percent increase in rates, I would have a harder time making the estimate stand up, and I believe it would be less logical than if I

just went ahead on the assumption that the present rates were going to remain in effect.

By Mr. Littman:

Q. Were any of the estimated increases shown by you in Lines 3 and 4 for Detroit furnished to you by Michigan Consolidated Gas Company, either in whole or in part?

A. No, sir, they furnished me no information whatsoever, although I believe they would have if I had requested it.

Q. I thought you said you had, in your possession, the consumption—

A. (Interposing) Yes, I have in my possession all of the statistics regarding our sales to Detroit for a long period of time.

You see, Detroit would not have to furnish me with those figures because that is a part of the Panhandle Eastern record, the record of how much gas they sell to Detroit.

Q. How about the breakdown as between various classes of customers in Detroit?

A. It happens that the monthly bill which we render [fol. 3158] Detroit shows a tremendous amount of detail along those lines. It shows the number of house heating customers on the face of it.

Q. You furnish that to Michigan Consolidated, do you?

A. The way the proposition works is this: Detroit is our customer. We sell gas to Detroit but Michigan Gas Transmission Corporation acts as our agent, if you please, and renders the bill to Detroit on our behalf.

They send us copies of all those things, of course, and then we make out a bill to Michigan Gas Transmission Corporation billing them for the gas. They collect the money.

Q. Where does Michigan Consolidated Gas Company come into this picture? Don't they furnish you some information? I am talking about the Detroit distributing company. Don't they furnish you with some information with respect to the number of customers and the consumption by each customer, and other information?

A. We have no formal arrangements with them for obtaining that information. Perhaps this would answer your question—

Q. (Interposing) The thing I would like to know is—

A. (Interposing) Where I get my information?

Q. Where you get your information.

A. Yes. I am trying to anticipate you so we can rush it along. I go up annually and, in connection with the con- [fol. 3159] tracts between the two companies, audit the records of the two companies.

Q. Of what two companies?

A. Panhandle Eastern's relations to the Detroit company. The Detroit company's record of its sales to its customers is one of the figures which I personally look at every spring as it is one of the requirements of the existing contract.

In other words, we have access to their records and they are always glad to give us information and the information we have actually reflects their sales in Detroit.

Q. Then you have a breakdown by customers for your use in preparing estimates and so forth, is that correct?

A. We have a breakdown by customers, not possibly as much in detail as you might think, because we do not go into their records and find out how much of their gas is sold to commercials, and how much is sold to industrials, but we do find out how much is sold to house heating customers.

. . . . . .

[fol. 3162] By Mr. Littman:

Q. How did you arrive at the 142,000 M. c. f. figure for the maximum day in Detroit shown in Line 4, Column D?

A. That was the figure that I computed, consisting of two parts; one, the maximum demand attributable to the house heating business plus, two, the maximum demand attributable to the remainder of the business.

The house heating demand was 84 million and base load demand was 58 million.

Q. Are you talking about M. c. f. now, or cubic feet?

A. Excuse me, 84 million cubic feet, 58 million cubic feet, making a total of 142 million cubic feet.

Q. Did you utilize a load factor in arriving at the figures which you just mentioned?

A. Yes, that is shown on my work sheet also. I used 80 percent load factor in arriving at the maximum day applicable to the base load.

Q. And what load factor did you use for the house heating load?

A. I got that by a very rapid calculation involving three factors, namely, my estimate of the number of degree days on the maximum day, the number of cubic feet consumption per customer on that maximum day and the number of house heating customers.

I multiplied together the number of customers times the [fol. 3163] consumption per degree day times the degree days, and arrived at a figure which, roughly, in my opinion, represents the maximum demand we might expect during the coming winter from the house heating load at Detroit.

Q. Can you give us a typical example of the method applied by you?

A. A typical example of this method might go something like this: Suppose we knew that we were going to have—

Q. (Interposing) Pardon me, perhaps it might be better for you to take the actual figure that you gave, maximum demand for house heating business of 84,000 M. c. f. and give us the basic figures.

A. Yes. The basic figures that went into that appear roughly here on my work sheet to have been 70, which represents the degree days times 25, which represents the consumption per customer per degree day, times the number of house heating customers, which we expect to be on the lines as of the last of December, namely, 48,000, and those three things multiplied together give you your 84 million cubic feet.

Q. You mentioned a figure of 70. 70 what? What is that?

A. That is 70 degree days.

Q. What do you mean by a "degree day"?

A. That is the number of degrees below a base of 65 on the given day in question. Meaning, more specifically, that [fol. 3164] on a day when your temperature is zero, you have 65 degrees in that day. On a day when your mean temperature is 10 above zero, you have 55 degree days be-

cause that temperature is 55 degrees for that day below your base of 65.

Q. Now, you mentioned a figure of 25. Will you tell us what that represents?

A. Yes, that is just a rough rule-of-thumb that I find works out mighty well in estimating the consumption to be expected per house heating customer per degree day at Detroit.

In other words, that is how much gas a house heating customer will use for every degree of temperature below 65. It is a yardstick.

Q. What is that 25, cubic feet, or what?

A. Yes, that is the figure I use in this instance.

Q. I believe you gave us the increases for the maximum day in 1942 over that experienced in 1941, but I do not believe you explained—withdraw that—was that same method applied by you in the case of Detroit for the years 1943, 1944, 1945 and 1946 as shown in Lines 3 and 4 of your Exhibit 40?

A. Yes. I am looking at my work sheet and I observe from inspection of this work sheet that I used the same method that I have described for every year at Detroit.

Q. That is, you used the same load factor?

A. Yes, I used the same load factor.

Q. And did you use the same unit consumption for [fol. 3165] house heating customers? A. Yes, I did.

Q. Now, looking at Line 6, called Michigan Gas Industrial. I note you have no sales whatever for the year 1941 but you have annual sales of 1,040,000 M. c. f. in 1942. Will you explain that figure?

A. That title there, Lines 5, 6 and 7, other industrial—Michigan, or rather, "Other—Michigan" and the subheading is "Industrial" represents the industrial sales I expect to be made in Michigan during 1942 outside of those made to the Detroit company.

Mr. Lee: That is all of the Consumers' contract?

The Witness: Principally, that is Consumers' figures. There is also included there a little gas for Monroe and Adrian, Michigan, as I recall it.

Mr. Lee: But that has nothing to do with the Detroit area?

The Witness: It has nothing to do with the Detroit area.

By Mr. Littman:

Q. Is that a new market that you expect to secure in 1942?

A. Yes, that is a new market.

Q. Is it expected that the sales, industrial sales shown in Lines 6 and 7 for the years 1942 to 1946, inclusive, are to be made to a distributing company or distributing com-
[fol. 3166] panies? A. It is.

Q. What is the name of the distributing company?

A. Principally Consumers Power Company.

Q. Can you name any others?

A. As the years go on, others are added to that list. Without taking too much time or going too far into the work sheets, unless you request it, I will say to you that I believe that figure is principally Consumers Power, almost entirely, but there is, in addition to that, some business which we expect to pick up of an industrial nature at Monroe, Adrian, possibly some at Battle Creek is in there, and I believe that those are the principal ones that I can name.

Q. How about Pontiac and Flint?

A. That is in Consumers Power. Pontiac and Flint are Consumers Power.

Mr. Lee: May I ask a question?

Mr. Littman: Surely.

Mr. Lee: These distribution customers that you refer to, not those that you expect you will get some time in the future but that you already have gotten that will be operated in a short while, you have contracts with them, have you not?

The Witness: We have contracts with Consumers Power, Monroe, yes.

Mr. Lee: Adrian?

The Witness: I am not sure about Adrian. We have [fol. 3167] been negotiating with Adrian.

Mr. Lee: And likewise Battle Creek, you have been negotiating with?

The Witness: And we have a contract with Battle Creek.

Mr. Lee: So this anticipated increase in business outside of the Detroit area is pretty well covered by contracts already entered into?

The Witness: That is true. We seriously expect to serve that area.

By Mr. Littman:

Q. Will you give us a breakdown of this 1,040,000 M. c. f. figure in 1942 as between distributing companies?

A. I do not believe I can find that at the moment in my working papers, but I wish to repeat again that it is almost entirely Flint and Pontiac and other Consumers Power accounts.

Trial Examiner: May I call your attention, Mr. Morton, to Exhibit 59, which is a statement prepared by Mr. Watkins of gas revenues by states, covering a ten-year period to December 31, 1941, and in Column R, there appears to be a total of 32,397,585 representing sales for six months of the year 1941.

May I ask whether the same figures that are shown in that table are embraced in your figures in Column C for 1941?

The Witness: Yes, sir, Column C includes—

Trial Examiner: (Interposing) Column C in Exhibit 40—

[fol. 3168] The Witness: (Interposing) In Exhibit 40.

Trial Examiner: (Continuing) Is intended to reflect the same sales reflected by Column R in Exhibit 59?

Mr. Culton: That is Line 15, Mr. Examiner, Column R, total of 32 billion.

The Witness: Yes, sir.

Trial Examiner: That is supposed to represent six months of 1941?

The Witness: That is a thing that confused me.

Trial Examiner: Your Column C represents the entire year based on the first six months?

The Witness: It does.

Trial Examiner: But it does cover the same area?

The Witness: Yes, sir.

Trial Examiner: In other words, total sales?

The Witness: Yes, sir, total main line sales.

Trial Examiner: Well then, is your Exhibit 40 complete and does it represent all sales of the company? I call your attention, as a basis for that question, to the fact that on your Exhibit 40 appears a tabulation, commencing at the top, east of Dana and below, west of Dana.

Do the sales west of Dana include all States?

The Witness: The sales shown on this study do include all States and all sales which we are making and expect to make on the main line system of Panhandle Eastern Pipe Line Company.

[fol. 3169] Mr. Culton: This does not include Argus or the Local Area?

The Witness: That is the point I believe the Examiner is getting at. This study does not include sales to the Argus Pipe Line Company nor in the Local Area.

Trial Examiner: What the Examiner is approaching now is this question: Do your estimates of increased business during the next five-year period include estimates of increased business in the States west of Dana?

The Witness: Yes, sir, they do.

Trial Examiner: And the estimates for the entire area now served by your company, as shown on your proposed Exhibit 40, will not exceed the total contemplated pipe line capacity of 125 million M.c.f.?

The Witness: Our pipe line capacity at present is 250 million.

Trial Examiner: That is 250 million now?

The Witness: Yes, sir.

Mr. Wheat: And the total maximum day, your Honor, over-all for 1941 is 240,394,000 M.c.f. in Line 27, Column C, of Exhibit 40.

Trial Examiner: I wanted to understand this. You are relating estimates to your total capacity and, in your Exhibit 38, you had an original capacity of 80 million shown.

Mr. Wheat: That is correct.

[fol. 3170] Trial Examiner: In the early years, which was then increased to 125 million?

Mr. Wheat: Correct.

Trial Examiner: And at what point does it step up to 250 million?

Mr. Wheat: That was included, of course, in the testimony of Mr. Creveling and also Mr. Burnham, but there are a number of steps there and I am sure the witness is giving you, in general, the steps.

Trial Examiner: That is what I wanted to bring out and relate to these exhibits. At what point do you step up from 125 million capacity, which was discussed this morning, to a greater capacity, and what is that capacity?

Mr. Culton: What the Examiner desires to know is, what is the capacity at this time, the Max. Day capacity at this time?

Trial Examiner: With relation to the years covered by the exhibits.

Mr. Wheat: Possibly I could get that by asking the witness a question.

In Exhibit 38, Mr. Morton, you showed, approximately, for the year 1937, did you not, a capacity in the pipe line of 125 million cubic feet?

The Witness: Yes, sir.

Mr. Wheat: Now, since the year 1937, there have been increases in the capacity in the main pipe line, have there not?

[fol. 3171] The Witness: There have been.

Mr. Wheat: So that, at the present time, as testified by several [witness] here, the main line capacity is now 250 million, is that correct?

The Witness: That is correct.

Mr. Wheat: Now, can you, from any notes that you have here, state the times when the capacity was increased by certain amounts which add up to the present capacity of 250 million?

The Witness: I have before me a memorandum which I sent to Mr. Paxton and which formed the basis of a report to the S. E. C., so I know that it is official with respect to those matters you have inquired about.

The capacity in December of the various years on our pipe line was as follows:

December, 1935— 80 million

December, 1936—125 million

December, 1937—180 million

December, 1938—200 million

December, 1939—200 million

December, 1940—250 million

December, 1941—250 million.

Trial Examiner: Now, does that represent the maximum capacity which had been produced by all betterments now in process or contemplated immediately?

The Witness: No, sir. That represents the capacity as [fol. 3172] it stands today before any of the improvements which we are working on have been made.

Trial Examiner: And can you state, in that connection, whether the contemplated improvements, including your extended line in Michigan and your completion of looping program, are you able to state what effect that will have on the capacity?

The Witness: That, your Honor, has been testified to, I am quite certain, by our chief engineer, Mr. Burnham, and I believe that this, roughly, outlines what he has told me on the subject, that our present capacity is 250 million;

that we have under construction and planned now and are going to go forward with as rapidly as possible, as rapidly as we can get the pipe, with construction that will raise the capacity of this pipe line to something very close to the figure I have shown here for 1943, namely, 243 million.

Mr. Wheat: You mean 343 million.

The Witness: 343 million.

Trial Examiner: So that your estimates beyond 1943 will not be beyond the capacity of the present contemplated improvements?

Mr. Culton: The 1942 estimates, Mr. Examiner, cannot be served by the present line. I remind the Examiner that Mr. Creveling testified that we will have to complete some looping which the company has in mind for next summer in order to be able to handle the load for the win-[fol. 3173] ter of 1942 and 1943. I think he also testified that we are going to be running pretty close to the shore during the current winter of 1941 and 1942 and that to reach what is estimated for the winter of 1942 and 1943, some additional looping, for which contracts have been made and which they expect to complete next summer, will be in progress and that additional capital will be required later to complete the program so as to account for an adequate Max. Day to meet these peaks in the various years that are shown on this exhibit.

. . . . . .

[fol. 3174] By Mr. Littman:

Q. Now, Mr. Morton, we were discussing the figure in Column D, Lines 5, 6 and 7 of 1,040,000 M. c. f. annual sales to industrials in Michigan other than industrials at Detroit.

Does that amount represent gas sales which are already contracted for?

A. They are contracted for, to this extent, that we have contracts with Pontiac, Flint, that is to say, the Consumers Power, and that is where most of that gas is going.

Q. Can you tell us how much?

A. I find here on my work sheet 4-A, that I have estimated that of that total industrial sale expected in 1942,

680 million out of the 1,040 million would be expected to be sold at Pontiac, Flint and Owosso.

Q. Let me get those figures on a comparable basis. Your exhibit speaks in terms of M. c. f. Would you mind talking also in terms of M. c. f.?

A. All right. I should say that out of a total of 1,040,000 M. c. f., it appears from my working sheet here that I [fol. 3175] have estimated that Pontiac and Flint and Owosso will take 680 thousand M. c. f.; Jackson, Kalamazoo and Marshall, 160 thousand M. c. f.; Battle Creek, 200,000 M. c. f.

Q. Now, what is the basis of those estimates? You have not sold any gas yet, have you?

A. That is true.

Q. How did you arrive at those figures?

A. Those figures have their origin back in reports and studies which were made sometime ago regarding the Consumers Power System and the Michigan load up there in Michigan.

[fol. 3176] Q. Studies made by whom?

A. My first reference, and you will find it here in my working sheets, is from the Consumers Power people themselves. They have sent us a very fine summary consisting of many pages, of the industrial plants which they regard as likely prospects and which they believe that they will sell gas to when we come to Michigan, and that is the basis for that estimate.

Trial Examiner: Are those communities served now by gas?

The Witness: Most of them are served by manufactured gas. As a matter of fact, I do not believe I have named any that were not already served with manufactured gas, and possibly some of them with natural gas.

By Mr. Littman:

Q. You are not now referring to the industrials, are you? We are presently discussing, namely,—

A. (Interposing) He said communities.

Q. What about the industrials?

A. Now, those industrials, I am unable to tell you right offhand whether or not they are receiving service now. I could probably find it here among this wealth of information which I boiled down into this estimate.

Q. Well, who worked up that estimate to which you just alluded, for the sale of industrials in 1942?

A. Well, I worked up the final figure, but, of course, [fol. 3177] as I say, it is based upon reports which we received from Consumers Power folks.

Q. That accounts for 680,000 M. c. f. of it?

A. Yes. Now, the other—are you inquiring about the other?

Q. I am sorry to have misled you. That accounts for 840,000 M. c. f. of the total of 1,040,000?

A. Yes. Now, the next figure, I said that went to make up the total of 1,040,000 M. c. f., is expected to come from Battle Creek, and I made that estimate personally without any assistance from anyone other than my general knowledge of what you might expect from Battle Creek.

Q. How did you go about arriving at it?

A. I think it is rather difficult, Mr. Littman, to describe to you what I am forced to call "subconscious processes." I probably thought something like this or worked something like this: I took Brown's Directory, which is a directory of all gas companies showing the consumption and sales that they had experienced in the past up there at Battle Creek.

Q. Just a minute. Sales to whom?

A. That the Battle Creek Gas Company has made to its customers.

Q. Do you mind if I interrupt at this point to clear up some of these matters as we go along?

[fol. 3178] Now, the sales in Battle Creek are artificial or natural gas sales?

A. They are artificial, as I recall it, at the present time.

Q. Does the local distributing company in Battle Creek make any sales to industrials?

A. They have quite a bit of industrial sales at Battle Creek, yes. It is quite an industrial center. You see indications of it on breakfast food boxes; their signs.

Q. Well, is the figure of 200,000 M. c. f. to be sold to industrials at Battle Creek based upon the last year's sales to industrials at Battle Creek?

A. No, it is not directly related to that but only insofar as I have looked at their sales on a manufactured gas

basis, and I have looked at the town, in my mind's eye, and I have said, "If these people with this kind of town can sell this much manufactured gas at the high prices that manufactured gas is sold, that they will sell 200 million on a natural gas basis at the prices at which natural gas is going to be made available to them." That is about the entire process.

• • • • • • •

[fol. 3191] O. W. Morton a witness, having been prev-
[fol. 3192] iously sworn, resumed the stand and testified further as follows:

Cross Examination (Continued)

By Mr. Littman:

• • • • • • • •

[fol. 3193] Q. Now, at yesterday's session, we were discussing the estimates shown from Lines 5 to 7, inclusive, for Michigan called "Other Industrial". Will you please give your explanation as to the method followed by you in arriving at the estimates shown for the years 1942 to 1946, inclusive?

A. The figures on Line 6 represent my estimate of the industrial sales which we expect to be made in Michigan through the coming years outside of those that might be included in Detroit.

The basic data for arriving at most of the amounts shown on this line comes from industrial surveys which have been made in Consumers Power territory and forwarded to us.

The estimate, as I said, is principally gas expected to be sold in Consumers Power territory, that is, Pontiac, Flint, Owosso, Jackson, Kalamazoo and Marshall, but there is included also, in this line, 200,000 M.c.f. to 500,000 M.c.f. down through the years at Battle Creek, Michigan.

The amounts, in comparison to some of the other totals, are not large, and unless you indicate otherwise, I will [fol. 3194] make a more extended explanation on the larger items, and cut down my explanations on the smaller items.

I believe that is the only information I can volunteer, at the moment, on that particular setup of figures shown on Line 6.

Q. Do you have working papers in support of this estimate of other industrials in Michigan which you just—

A. (Interposing) Yes, I do. You will find in my working papers a summary of such data on work sheet No. 4-A. There are other details behind that summary, and these you will find in typewritten sheets which constitute the industrial survey that was made in that territory and forwarded to us by the Consumers Power Company.

I understand that you have made copies of the typewritten sheets to which I last referred.

Q. Will you please include among the typewritten work papers to be submitted to us, work sheet No. 4-A that you just alluded to, and any other working papers that you prepared in connection with this estimate?

A. I will be glad to do so.

Q. What was the sheet number on Detroit?

A. The working sheet number on Detroit was, No. 1.

Q. What is contained on work sheets Nos. 2, 3 and 4?

A. Work sheet No. 2 is a detail of the estimated sales at Ann Arbor, Monroe and Adrian, Michigan, and at the [fol. 3195] bottom of work sheet No. 2 is shown a total of these three towns.

Work sheet No. 3 is an estimate of total sales to be experienced in southern Michigan, assuming local gas is depleted at the end of five years from December 31, 1940, and it is a memorandum which is, in fact, a summary of the sales that are expected to be made in Consumers Power territory in Michigan.

Q. Mr. Morton, have you finished your answer?

A. Yes.

Q. What is contained in work sheet No. 4?

A. Work sheet No. 4 is a summary which shows the totals of Sheets 2 and 3.

Q. Mr. Morton, I note that in Column G for 1945 the annual sales for Other Industrials in Michigan is 1,718,000 M.c.f. and, that for 1946 there is a rather sudden increase, or a great increase, to 3,323,000 M.c.f.

Also, that in 1945, the maximum day figure is 5,270 M.c.f., whereas it increases greatly to 10,040 M.c.f. in 1946. Will you please explain the reasons for this increase in your estimate?

A. That is brought about by a circumstance which we discussed yesterday. The depletion, or I should say, the estimated depletion, in the local supply of gas in Michigan, it is anticipated that we will be serving a portion of the Michigan load up until that time and that as soon as their gas runs out, which has been predicted, I understand, [fol. 3196] officially by the Michigan Public Service Commission in their 1940 report, by the time that gas runs out, or rather, I should say, when the gas runs out, will pick up the entire load.

Q. What assurance do you have that you will secure such a load? Do you have a contract for it?

A. Yes, we have a contract with Consumers Power Company for that business, and we also have a contract, as I testified yesterday, with Battle Creek and these other customers that are indicated here as being included in this estimate, have expressed a great deal of interest in our natural gas, and I have no doubt that we will execute contracts with all of them shortly.

Q. Is the contract to which you have just referred with Consumers Power on file with the Federal Power Commission?

A. Yes, it is.

Q. Do you know of the number of that contract?

* * * * * * * * *

[fol. 3197] By Mr. Littman:

Q. Am I correct in understanding that a part of the 3,323,000 M.c.f. figure in Column H, Lines 6 and 7, is not contracted for?

A. That is correct.

Q. Do you have a breakdown in your working papers to show how much?

A. Specifically, we have no contract with Lansing and Grand Rapids and possibly one or two of the others that appear in that group.

Q. Now, will you please give us a segregation of the figures in Lines 6 and 7, as between distributors and direct customers?

A. All of the gas which we have estimated in those lines has been estimated on the basis of our sales to distributors.

Q. None of it is directly to industrial consumers?

A. That is correct.

Q. Now, will you give us the breakdown of those same figures, showing how much of this gas is presently contracted for; secondly, that amount which is contracted for but has not yet been served; and, third, that which has not yet been contracted for, and the reason for your inclusion of the latter class in this estimate?

A. None of this gas is being served at the present time.

[fol. 3198] Q. I might state, Mr. Morton, if you can save time by referring to any working papers that show the detail that I am requesting, that will be sufficient, if you will identify the working papers.

A. My working papers do not show on their face how much of this gas has been contracted for, how much has been contracted for and not served, and how much has not been contracted for at all, but maybe this would give you the information you want:

From examining the working sheets, it is quite apparent to me that about 90 percent of the gas that we have been discussing on Lines 6 and 7 goes to the Consumers Power territory which has been contracted for.

Q. Does that 90 percent apply to both Lines 6 and 7 for each of the years 1942 to 1946, inclusive?

A. It does.

Q. Does the 3,323,000 M.c.f. figure in Column H include sales to any communities other than those which you named as the subject of the Consumers Power Company contract?

A. Yes, they include sales to Battle Creek, Lansing, Grand Rapids, and possibly some others, the names of which I cannot recall at the moment.

Q. Would Mount Pleasant, Michigan, be one of those?

A. I have that one listed in my work sheets, and the answer is, "yes."

[fol. 3199] Q. Will you please read the paragraph in your working papers that includes the City of Mount Pleasant?

A. It is numbered 4; Lansing, Grand Rapids, Saginaw, Bay City, Alma, Clare, Big Rapids, Muskegon, Mount Pleasant. That figure appears once only in the whole record, and that is for the year 1946.

Of course, the estimate is a very rough estimate for the year 1946.

Q. What period is covered by your working papers?

A. It happens that my working papers are prepared on the basis of a ten-year estimate extending to 1951.

Q. Now, Mr. Morton, suppose we go to the next classification shown in Lines 8 and 9 for Michigan domestic, commercial, and other.

Will you please explain the method used by you in arriving at the estimates shown in those lines through 1946?

A. That, I might say, is a companion estimate with the two lines above, Lines 6 and 7. The figures shown on Lines 8 and 9 are the domestic and commercial sales in the same territory which we have been discussing.

Those figures are principally sales which we expect to make to Consumers Power. They include Battle Creek. They include, as the title would indicate, since they are under "Michigan, Other," all other domestic and commercial sales which we expect to make in the State of Michigan outside of Detroit.

[fol. 3200] They include Ann Arbor, Adrian, Monroe; beside the Consumers Power territory that we have named. They include Lansing, Grand Rapids, Saginaw, Bay City and Alma, and so on, but only during the fifth year on the latter group.

The basis for this exhibit, or the foundation or working papers back of it go back to summaries, estimates, surveys, that were furnished us in great detail by the Consumers Power Company for their territory, and the estimates for Battle Creek Adrian, Monroe and Ann Arbor were prepared by me from data which I have on hand.

The figures are a rather large part of the total, running an average of 5 billion cubic feet or 5 million M.c.f. per year.

You will note, just as the industrial sales jumped from 1945 to 1946, the domestic-commercial sales also take that

same jump, and this is due to the same reason that the industrial sales jumped, as I have explained before; namely, the depletion of local gas in Michigan.

Mr. Wheat: What are the numbers of those work papers?

The Witness: The numbers of the work sheets covering this estimate are 2, 3, 4 and 4-A.

By Mr. Littman:

[fol. 3201] Q. Referring to the figure 10,296,200 M.c.f. shown in Line 8, Column H, and the figure immediately below it, 42,760 M.c.f. for the maximum day, will you state whether or not all of that is embraced by the present contract with Consumers Power?

A. No, as I explained before, these figures are companion figures to the industrial study just above. They apply to the same territory, principally, however, to the Consumers Power territory but include, as I have said, some other towns in Michigan.

Q. Will you name the other towns in Michigan and the distributing companies?

A. I am unable to do that because my memory has about reached the breaking point on this discussion of these work sheets.

The towns, as I have enumerated several times before this morning, are: Adrian, Monroe, Battle Creek, Grand Rapids, Lansing, outside of Consumers Power, that is what you asked for.

There may be a few more which I cannot recall, but they are not very important.

Q. Can you state what part of the M.c.f. figures that I read are contemplated to be sold to those communities which you just named and which are outside the scope [fol. 3202] of the Consumers Power contract? You may do that approximately.

A. Yes, I understand. I was going to say that that particular breakdown does not exist here on these work sheets.

It is something that has to be worked out, but from just an inspection of them here, it is easily seen that the Consumers Power will take about 90 percent of this total.

Q. Can you give us a breakdown of the 90 percent figure as between territory served by Consumers Power under contract and that which will not be served under that contract?

A. A breakdown as between what classifications?

Q. As between the territory now contracted for and territory not now contracted for.

A. Well, I am under the impression that all of the Consumers Power territory has been contracted for, as I recall it, and this is from memory.

The contracts that exist between ourselves and Consumers Power call for service to all of these towns for all of this gas. In other words, it is already contracted for. I would say 90 percent of all of the gas we are talking about has been contracted for.

* * * * * * * *

[fol. 3203] Q. Mr. Morton, am I correct in stating that the territory in which Consumers Power Company now sells gas embraces the territory in and about Lansing, Michigan, Ithaca, Michigan, and Bay City and Saginaw?

A. I knew they operate in Bay City and Saginaw. I do not know about Ithaca, and Lansing is a Consumers Power town, I believe.

Q. Now, your 1496 estimate of 10 million M.c.f. for domestic, commercial and other in Michigan includes, does it not, sales to the territory of Lansing, Ithaca, Bay City and Saginaw?

A. It does.

Q. Does the 1945 figure, in the amount of 5,451,000 M.c.f. include such sales?

A. It does not.

[fol. 3204] Q. Can it be determined from your working papers how much of your 10,296,200 M.c.f. estimate applies to the Lansing, Ithaca, Bay City and Saginaw territory?

A. It appears that about 6 million M.c.f. out of the 10 million M.c.f. has been estimated as applying to Lansing, Grand Rapids, Saginaw, Bay City, Alma, Clare, Big Rapids, Muskegon and Mount Pleasant.

Q. Now, turning to your estimate for Indiana and Ohio, you show in Line 11 and in Line 12, your annual sales and maximum day sales to industrials in those States for the years 1941 to 1946, inclusive.

Will you please explain the method whereby you arrived at those estimates?

A. That sale applies almost entirely to industries in and around Muncie, Indiana. We have several years' past records on these sales and, from a study of these records and from my personal knowledge and experience, I have estimated that the sales this year under this classification will be about 10 million M.c.f. based upon this year's sales and the prospects, as I see them, for the ensuing years.

I have estimated for the 1942—11 billion plus; 1943—12 billion plus; 1944—almost 13 billion; 1945—13 billion plus; 1946—13 billion, 700 million, a very gradual increase of sales to industries in the State of Indiana.

Q. Now, what were the actual sales to these industries [fol. 3205] in 1940?

A. The actual sales for 1940, according to the record which I have here in front of me was 7,682,862 M.c.f.

* * * * * * * *

Q. How much of this 10,250,000 M.c.f. in 1941 is actual, and how much of it is estimated?

A. Well, at the time I made this estimate,—I see it is dated August 6 here in the corner—I probably had only six or seven months' experience so that the 1941 figure shown here is probably six months actual and six months estimated.

[fol. 3206] Q. Have you verified your estimate recently?

A. No, I have not, except in a most general way. I watch the daily deliveries through the pipe line and I also watch the deliveries at King Station which, by the way, is the station where we deliver the gas for the Muncie group and those sales are holding up nicely, and I won't be surprised but what they exceed the figure I have shown here for 1941.

* * * * * * * *

Exhibits:		
1, Statement of operating Results of Panhandle Eastern Pipe Line Company and Michigan Gas Transmission Company, 1938-1940	10775	4012
Operating Results	10775	4012
Cost, and Cost Less Reserves, of Plant and Operating Results as of December 31, 1938	10777	4013
Cost, and Cost Less Reserves, of Plant and Operating Results as of December 31, 1939	10778	4014
Cost, and Cost Less Reserves, of Plant and Operating Results as of December 31, 1940	10779	4015
Working Capital Estimate, December 31, 1938-39-40	10780	4016
Working Capital Estimate Approximate Payroll Basis, December 31, 1940	10782	4017
2, Determination of possible Revenue Reduction of Panhandle Eastern Pipe Line Company and Michigan Gas Transmission Company	10783	4018
3, Excerpts from Registration Statement of Panhandle Eastern Pipe Line Company filed with the Securities & Exchange Commission, February 12, 1937, with respect to Gas Reserves	10785	4019

	Original	Print
4, Excerpt from Registration Statement of Panhandle Eastern Pipe Line Company filed with the Securities & Exchange Commission, November 13, 1940, with respect to Gas Reserves	10786	4021
5, Excerpts from Registration Statement of Panhandle Eastern Pipe Line Company filed with the Securities & Exchange Commission, November 13, 1940, with respect to Design, Construction and Maintenance of Property	10789	4025
6, Statement of Operating Expenses and Taxes at 100% Load Factor Operation	10791	4029
7, Statement as to necessary Price per M. C. F. at 100% Load Factor	10793	4030
8, Statement of estimated Effect of 100% Load Factor on earning Power of System	10795	4030
9, Statement of Factor affecting the Nature and Magnitude of reported Net Incomes	10796	4031
10, Statement showing Effect of Variation in accounting Practices on Reported Incomes of an Enterprise	10799	4034
11, Chart showing Relation of Yield of United States Treasury Bonds and Notes	10800	4035
12, Statement showing United States Treasury Bond Yields	10801	4037
13, Chart showing History of Yields of United States Bonds, 1920-1939	10806	4045
14, Average Yield of United States Treasury Bond	10807	4047
14-A, Securities & Exchange Commission Releases Nos. 2778 and 2834 — Findings and Opinion of the Commission in the Matters of Panhandle Eastern Pipe Line Company, et al	10808	4047

Index, Volume IX.

Order of Securities & Exchange Commission Denying Applications in Part and granting Applications in Part	10842	4087
Supplemental Order of Securities & Exchange Commission amending Findings and Opinion	10844	4089
17, Miscellaneous Data concerning Property and Operations of Panhandle Eastern Pipe Line Company	10848	4090
Schedule 1, Panhandle Eastern Pipe Line Company System Compressor Stations	10848	4090
Schedule 2, List of Communities receiving Service directly or indirectly from Panhandle Company including Population and Number of Customers as of June 30, 1941	10849	4091
Schedule 3, List of Industrial Customers receiving Service direct from Panhandle Company System, June 30, 1941	10853	4099
Schedule 11, Panhandle Eastern System Summary — Miles of Pipe by Sizes, June 30, 1941	10926	4101
30, Testimony of Rufus M. Smith	10958	4103
Schedule 2, Estimated Original Gas Content in the Texas Panhandle Field under Acreage constituting Reserves of Panhandle Eastern Pipe Line Company as of July 1, 1941	10986	4125

	Original	Print
Schedule 3, Estimated Remaining Gas Content in the Texas Panhandle Field under Acreage constituting Reserves of Panhandle Eastern Pipe Line Company as of July 1, 1941	10987	4125
Schedule 5, Comparison of Open Flow Potentials in Texas Panhandle Gas Field	10990	4129
Schedule 6, Gas Acreage owned and under Gas Purchase Contracts held by Panhandle Eastern Pipe Line Company as of June 30, 1941	10991	4131
Schedule 7, Hugoton Production to Argus Natural Gas Company, Inc. by Panhandle Eastern Pipe Line Company, et al	10992	4133
Schedule 8, Texas Production to Panhandle Eastern Pipe Line Company	10993	4135
Schedule 9, Hugoton Production to Panhandle Eastern Pipe Line Company	10997	4143
Schedule 10, Hugoton Production to Panhandle Eastern Pipe Line Company	11000	4149
Schedule 11, Analysis of Cumulative Production to Main Line to and including Fiscal Month of June 1941	11003	4155
Schedule 12, Comparative Statement of Production and Purchases from each District for the two Years ended June 22, 1940 and June 22, 1941	11004	4157
36, Testimony of Glenn G. Bartle	11010	4159
Schedule 3, Estimated Original Gas Content in the Hugoton Field, (Kansas, Oklahoma and North Texas Panhandle), under Acreage constituting Reserves of Panhandle Eastern Pipe Line Company as of July 1, 1941	11038	4176
Schedule 4, Estimated unmetered Gas from Panhandle Eastern Pipe Line Company Wells in the Hugoton Field Kansas, connected to Argus Natural Gas Company, Inc. as of July 1, 1941	11041	4181
37, Testimony and Exhibits, Market Value of Leases of Panhandle Eastern Pipe Line Co.	11047	4187
R. J. Wallace	11047	4187
Summary of Market Value of Leases	11064	4199
38, Basic Statistics used in calculating Interest, ad valorem Taxes and Operating Expense attributable to unused Capacity	12159	4203
39, Reproduction Cost New of Plant, Property and Business of Panhandle Eastern Pipe Line Company and subsidiary Companies as of June 30, 1941	12162	4206
Letter P. McDonald Biddison, Consulting Engineer, to Panhandle Eastern Pipe Line Company, August 29, 1941	12163	4206
Statement relating to Reproduction Cost New—June 30, 1941	12164	4207
Summary	12165	4207
39-A, Reproduction Cost New of Plant, Property and Business of Panhandle Eastern Pipe Line Company and subsidiary Companies as of June 30, 1941	13130	4208
Letter P. McDonald Biddison, Consulting Engineer, to Panhandle Eastern Pipe Line Company, August 29, 1941	13130	4208

	Original	Print
Statement relating to Reproduction Cost New—June 30, 1941	13131	4209
Summary	13133	4209
40, Table showing estimated Main Line Sales, years 1941-1946, inclusive	13149	4211
41, Graph showing Sales and Gas Plant by Years, Panhandle Eastern Pipe Line Company and Subsidiary Companies	13150	4213
42, Testimony of C. H. Hinton relating to Future Capital Expenditures and Operating Expenses in Production and Gathering System West and South of Liberal, Kansas	13151	4215
43, Schedules presented in connection with the written Testimony of C. H. Hinton	13193	4244
Schedule 1, Additional Capital Expenditures required to produce and gather Basic Load, or Present Requirements	13194	4244
Schedule 2, Additional Capital Expenditures required to produce and gather Anticipated Increased Load	13195	4244
Schedule 3, Estimate of Operation and Maintenance Costs -west of Liberal Panhandle Field — Basic Load	13196	4245
Schedule 4, Estimate of Operation and Maintenance Costs — west of Liberal Panhandle Field — Estimated Future Load	13199	4251
Schedule 5, Probable Production from Panhandle Eastern's own Wells and Wells under Gas Contracts (Panhandle Field) during the Period July 1, 1940 to December 31, 1956	13202	4257
47, Panhandle Eastern Pipe Line Company and Subsidiary Companies, future Capital Requirements, Gas Transmission Facilities, Liberal Station and Eastward	13206	4257
48, Statement showing Balance Sheets per Books Panhandle Eastern Pipe Line Company and Subsidiary Companies, as at each December 31, 1930 through 1940 and as at June 30, 1941	13207	4259
49, Income Statement per Books — Period from April 1, 1932 to December 31, 1941	13210	4265
50, Statement showing Earned Surplus per Books, Period from Commencement of Operations to June 30, 1941	13212	4269
51, Statement showing Capital Surplus per Books, Period from September 1, 1930 to June 30, 1941	13214	4273
52, Statement showing Investment in Gas Plant as at each December 31, 1930 through 1940 and as at June 30, 1941	13215	4275
53, Statement of Dividends paid on Class A and Class B Preferred Stocks from beginning to September 1, 1941	13217	4279
54, Statement of Dividends paid on Common Stock from beginning to September 1, 1941	13219	4280
55, Statement showing Comparison of Sales and Revenue, Principal Industrial Customers, years 1939, 1940 and 1941	13220	4281
55-A, Statement showing Comparison of Sales and Revenue Principal Industrial Customers, years 1939, 1940, and 1941	13221	4283
56, Statement of Gas Produced, Period from April 1, 1932 to June 30, 1941	13222	4284
57, Statement of Gas Purchased, Period from April 1, 1932 to June 30, 1941	13223	4285

	Original	Print
58, Statement of Gas Revenue, Period from April 1, 1932 to June 30, 1941 and Schedule showing Detail of Sales to various Types of Customers, 1939 and 1940	13224	4287
Schedule 1, Statement of Gas Revenue, Period from April 1, 1932 to June 30, 1941	13224	4287
Schedule 2, Detail of Sales to Gas Utilities, years 1939 and 1940	13225	4289
Schedule 3, Detail of Sales to Industrial Customers, years 1939 and 1940	13227	4293
59, Statement of Gas Revenue by States, Period from April 1, 1932 to December 31, 1941	13229	4297
60, Statement showing Sales Agreements with other Gas Companies as at June 30, 1941	13230	4299
61, Study of Current and Future Trends in Commodity Prices and Wages, by David Friday	13238	4310
Graph showing Wholesale Prices from 1800 to 1940	13239	4311
Index Numbers of Wholesale Prices of Commodities by Groups	13241	4313
Commodity Price Indexes of Ten Countries	13247	4318
Statement relating to Tax Collections in the United States, from 1913 to 1942	13258	4328
Index Numbers of Wholesale Prices of all Commodities by Months, from 1890 to 1940	13263	4333
Statement relating to Wholesale Prices for Week Ended September 20, 1941	13264	4335
Graph relating to Average Weekly Earnings in Manufacturing Industries of New York State from 1914 to 1941	13266	4339
Graph relating to Average Hourly Earnings and Average Actual Hours per Week per Worker in twenty-five Manufacturing Industries from 1914 to 1941	13267	4341
Graph relating to Average Cost of Living from 1935 to 1939	13268	4343
62, Deduction from Cost of Reproduction New for Depreciation and Present Value of Plant, Property and Business as of June 30, 1941	13270	4345
Letter from P. McDonald Biddison, Consulting Engineer, to Panhandle Eastern Pipe Line Company, September 30, 1941	13271	4345
General Summary	13272	4347
63, Investors' Appraisal of the Risk of Capital in the Natural Gas Industry as compared with other Divisions of the Utility Industry, Summary of Analyses, prepared by Paul B. Coffman, Vice-President of Standard and Poors Corporation	13321	4349
Table of Contents	13322	4349
Statement of Experience and Qualifications of Paul B. Coffman	13327	4354
Investors' Appraisal of Capital Risks in Various Divisions of the Utility Industry	13348	4371
Statement A, Investors' Appraisal of Risks in Capital for the years 1937, 1938, 1939 and 1940	13351	4373

	Original	Print
Statement A-1, Investors' Appraisal of Risks of Capital for the Interim-Period of 1941, January-August, Both Inclusive	13352	4375
Statement B, Investors' Appraisal of Risks of Capital for the years 1937, 1938, 1939 and 1940	13353	4377
Statement B-1, Investors' Appraisal of Risks of Capital for the Interim Period of 1941, January-August, Both Inclusive	13354	4379
Statement C, Investors' Appraisal of Risks of Capital for the years 1937, 1938, 1939 and 1940	13355	4381
Statement C-1, Investors' Appraisal of Risks of Capital for the Interim Period of 1941, January-August, Both Inclusive	13356	4383
Statement D, Investors' Appraisal of Risks of Capital for the years 1937, 1938, 1939 and 1940	13357	4385
Statement D-1, Investors' Appraisal of Risks of Capital for the Interim Period of 1941 January-August, Both Inclusive	13358	4387
Statement E, Investors' Appraisal of Risks of Capital for the years 1937, 1938, 1939 and 1940	13359	4389
Statement E-1, Investors' Appraisal of Risks of Capital for the Interim Period of 1941, January-August, Both Inclusive	13360	4391
Statement F, General Information Covering each Company as to the Nature and Size of the Business and the Territory served	13361	4393
64, Statistics supporting Data, Exhibit 63, Appendixes A, B, and C	13379	4414
Appendix A, Complete List of Companies studied and Reasons for eliminating those not used to determine Investors' Appraisal of Risks of Capital	13380	4414
Appendix B, Securities of forty-three Natural Gas Companies considered Representative of the industry, etc	13387	4426

Index, Volume X.

Appendix C, Working Papers showing the Computation of Investors' Appraisal of the Risks of Capital	13398	4446
Water Companies	13399	4447
Electric Operating Utility Companies	13420	4461
Manufactured and Mixed Gas Companies	13465	4501
Natural Gas Companies	13495	4521
65, Study relative to Rate of Return on Panhandle Eastern Pipe Line Company prepared by Paul B. Coffman, Vice President, Standard and Poors Corporation	13533	4547
Table of Contents	13534	4547
Chart No. 1, Main Transmission System of Panhandle Eastern Pipe Line Co. and Subsidiary	13542	4559
Chart No. 2, Growth of Natural Gas Industry in United States of America from 1906 to 1940	13548	4567
Chart No. 3, Consumption of Natural Gas in United States of America from 1919 to 1940	13550	4571
Chart No. 4, Revenue from Natural Gas Consumed in United States of America from 1919 to 1940	13552	4573

	Original	Print
Chart No. 5, Average Revenue per M. C. F. from 1929 to 1940	13554	4575
Chart No. 6, Panhandle Sales by States, vs. Industry Consumption of Natural Gas from 1934 to 1940	13556	4577
Chart No. 7, Trends of Gross Revenue from 1934 to 1940, Panhandle vs. other Pipe Line Companies and Industry	13558	4579
Chart No. 8, Operating Ratio of Panhandle Compared with other Pipe Line Companies from 1934 to 1940	13560	4581
Chart No. 9, Trend of Revenue and Expenses of Panhandle Eastern Pipe Line Company from 1934 to 1940	13562	4583
Chart No. 10, Percent Earned on Invested Capital of Panhandle Based upon Capital Structure	13564	4585
Chart No. 11, Percent Earned on Invested Capital of Panhandle Based upon Net Property, Intangibles and Working Capital	13566	4587
Chart No. 12, Return to Common Stockholders of Panhandle Eastern Pipe Line Company from 1934 to 1940	13568	4589
Chart No. 13, New Tax Bill will reduce Income sharply Computations based on Operations — Twelve Months ended June 30, 1941	13570	4591
Chart No. 14, Percent Earned on Invested Capital of Panhandle Eastern Pipe Line Company — as of June 30, 1941	13572	4593
Chart No. 15, Percent Earned on Invested Capital of Panhandle Eastern Pipe Line Company — as of June 30, 1941	13574	4595
Chart No. 16, Historical Costs of Debt Capital of Panhandle Eastern Pipe Line Company—from 1930 to 1941	13576	4599
Chart No. 17, Effect of 1941 Refinancing of Panhandle Eastern Pipe Line Company	13578	4603
Chart No. 18, Historical Costs of Preferred Stock Capital of Panhandle Eastern Pipe Line Company from 1937 to 1941	13580	4605
Chart No. 19, Earnings — Price Ratios of Natural Gas Pipe Line Common Stocks from 1937 to 1940	13582	4607
Chart No. 20, Current Earnings — Price Ratios of Natural Gas Pipe Line Common Stocks	13584	4609
Chart No. 21, Cost of Financing Northern Natural Gas Company Common Stock — Offered to Public on September 10, 1941	13586	4613
Chart No. 22, Estimated Current Cost of Financing Common Stock of Panhandle Eastern Pipe Line Company	13588	4615
Chart No. 23, Continuing Growth of Panhandle System Indicates Future Needs for New Capital	13590	4617
Chart No. 24, Panhandle Eastern Pipe Line Company Invested Capital as of June 30, 1941	13592	4621
Chart No. 25, Preferred Stock Unusual in Natural Gas Pipe Line Companies	13594	4623
Chart No. 26, Earnings Necessary to Maintain Credit Position of Panhandle Eastern Pipe Line Company	13596	4625
Chart No. 27, Earnings Necessary to Maintain Credit Position of Panhandle Eastern Pipe Line Company	13598	4627
Chart No. 28, Overall Cost of Capital to Panhandle Eastern Based on Ideal Capital Structure	13600	4629

[fol. 3207] Q. Well, Mr. Morton, are all of the sales shown in Lines 11 and 12 called "industrial sales in Indiana and Ohio" to be made through distributing companies?

In other words, are any of thes les to be made directly to the industrials?

A. My estimate contemplates no direct industrial sales by Panhandle Eastern. Of course, that is a matter of discretion to the management in years to come; but, as regards this particular estimate we are speaking of, and as far as I have anything to do with it, why, it has been prepared on [fol. 3208] the basis of sales just as they are now being made.

Q. Are all of those sales presently contracted for and being made to persons who are being served?

A. I would say that this estimate of mine, like all of my estimates that I have made here, contemplates some new customers but 95 percent of it is to customers who are now connected.

Q. You cannot give us the names of the new customers?

A. I cannot.

Q. By the term "customers", as you have used it, are you referring to the industrial customers or to the distributing company?

A. I mean both. I think that there will be an increase in the individual customers purchasing from distributing companies over the years, and I think also my estimate contemplates possibly the addition of another distributor or two.

You see, you cannot be too definite about these estimates that run for years into the future.

Q. I do not recall whether I asked you for the page numbers of your working papers?

A. No, you did not, on that particular estimate that we are discussing, and work sheet No. 5 covers all of the details that I have.

Q. And you will submit work sheet No. 5 along with the others?

[fol. 3209] A. Yes, sir.

Q. Now, will you please explain the method used by you in arriving at the estimate shown in Lines 13 and 14 for "Indiana and Ohio-Other (Including Company Use)"?

A. Yes, that estimate covers all of the sales that I estimate will be made in Indiana and Ohio, outside of the industrial which we have just been discussing.

That sale comprises the domestic and commercial sales, principally, of distributors throughout the State of Indiana and a very, very small sale in the State of Ohio; so small as not to merit any extended discussion.

That figure, as I say, is almost entirely a sale of domestic-commercial to distributors in Indiana, namely, Public Service Company of Indiana, Northern Indiana Public Service Company, Central Indiana Gas Company, Indiana Gas Distribution Corporation and Kokomo Gas & Fuel Company.

Now, that estimate, you will notice, increases very slowly from year to year. At the present time, it is running about 5,200,000,000. I estimate—

Q. (Interposing) Just a minute. Five billion—

A. (Interposing) Five million, two hundred thousand, M. c. f.

Q. Thank you.

A. I estimated for 1942 an increase from 5,200,000 to 5,600,000 M. c. f.; next, 6 million M. c. f., 6,400,000 M. c. f. [fol. 3210] 6,800,000 M. c. f., 7,200,000 M. c. f.

Q. That is a flat increase of—

A. (Interposing) 400,000 M. c. f. per year, a rather gradual, nominal increase. That is based upon the fact that I do not see any great expansion of natural gas consumption in Indiana for domestic-commercial use in the near future.

I do not contemplate any addition of any large number of customers, but just a slow, gradual growth of the presently connected customers, and possibly a very slight increase in new customers.

Q. Are those sales all contemplated to be made by the present distributing companies?

A. Almost in their entirety. The estimate probably includes, and undoubtedly does include, one or two small

distributors not now connected to the line who will subsequently be connected.

Q. And will you name those?

A. I think now particularly of the Greenfield Gas Company.

Q. Any others?

A. At the time the estimate was made, I had in mind also Richmond Gas Company. Since the estimate was made, Richmond Gas Company has come on to the lines and is now taking gas.

No, I cannot name, specifically, any more, but, un- [fol. 3211] doubtedly, there will be, as the years go by, some small distributors not now taking gas who will begin taking gas shortly.

Q. In other words, this estimate of "Other Indiana and Ohio" shown in Lines 13 and 14 did not contemplate any very large new territory?

A. That is correct.

Trial Examiner: May I ask whether that is, in part at least, due to the fact that the States of Indiana and Ohio, or those portions of those States, rather, adjacent to your lines and the line of the affiliate as well as Panhandle Eastern, are presently served from local fields?

The Witness: No, this did not contemplate that fact. This estimate contemplated the fact, I might say, that most of the customers who are within economic reach of our lines through those states are now taking gas from us.

I believe the local areas to which you refer are, in most instances, too far away from our lines to be served by us anyway.

By Mr. Littman:

Q. Before going to the next item, I would like to go back for a moment to the industrials in Indiana and Ohio, the estimate for which is shown in Lines 11 and 12.

What Ohio territory is embraced by your estimate of the industrial?

A. There isn't any of that estimate for industrial gas [fol. 3212] contemplated for Ohio.

Q. Now, do you have working papers in support of your estimates shown in Lines 13 and 14 for other than industrial in Indiana and Ohio? A. Yes.

Q. What are the page numbers?

A. Work sheet No. 6 covers that.

Q. And you will submit that page along with the others?

A. I will be glad to do so.

Q. Now, will you please explain your estimate shown in Lines 15 and 16 for Kentucky Natural Gas Company?

A. We made a contract with Kentucky Natural Gas Company in the summer of 1941. The contract is dated June 27. The minimum provisions of that contract call for their taking 1,650,000 M. c. f. per year for the first three years, 2,500,000 M. c. f. for the next two years, which takes us through 1946.

There was existent at the time of the execution of this contract what we call a deficiency, a certain amount of gas which they were supposed to have taken but had not done so under the minimum provisions of a certain contract.

They were, in other words, 140 million cubic feet short of their contracted takes, so, in arriving at the Kentucky Natural estimate, I was able to follow what I thought was a most logical procedure. I merely used the minimum stated in the existing contract, and added to it the shortage which [fol. 3213] they had left over from other years, and spread it over a reasonable length of time of about two years.

That is about all of the supporting data that the estimator has for the estimate on Kentucky Natural Gas Company, and I might add that I think that is all that was needed.

Q. What was the basis of your determination of the maximum day shown in Line 16 for Kentucky Natural Gas Company?

A. By knowing, as I do, that they have some very good operators who are attempting to take this gas on an even basis, day to day basis, and after watching the deliveries through our connection with them and confirming this, I felt quite assured that they would be able to maintain an excellent load factor through that connection; not 100 percent, because that is almost impossible of attainment due to fluctuations of pressure in the line, but I estimated that they would be able to maintain a 90 percent load factor, that is to say, that their maximum day would not exceed their average day by more than 10 percent.

Q. Do you know whether the contract with Kentucky Natural Gas calls for a uniform take?

A. The contract does not call for a uniform take, as I recall it. It says nothing about their taking uniformly. They are on a two-part rate, so it is to their interest to take on a uniform basis.

Q. Do you have working papers to support your estimate?

[fol. 3214] A. Work sheet No. 7 supports this evidence.

Q. You will submit that along with the others?

A. Yes, sir.

Q. Now, that takes us to the group that you have classified as "West of Dana." First, under this class, is industrial shown in Line 20. Will you please explain the estimate for that class which I have just named and which appears in Lines 20 and 21 of your Exhibit 40?

A. The average figure over the years is rather substantial, averaging about 14 million M. c. f. under this classification. Much of the gas we sell west of Dana, and when I say "we" this time, I am really over in our own territory, in the Panhandle Eastern territory and Illinois Natural Gas territory.

Much of the gas, as I was saying, that is sold over here is sold directly by us to industries. It comes right out of our line and goes right to the brick plant or the industry, whatever it may be, and we bill the customer directly for it.

About five-eighths of it is sold to Other Distributors who, in turn, resell it to industries.

The work sheet which is, by the way, No. 8, indicates the history, by months, of these sales to industries direct and indirect since April, 1939. Our records are very complete. We could have carried it back to 1936, but we thought that [fol. 3215] would be enough history upon which to base the future estimate, so the work sheet shows the details from 1939, by months.

It indicates that for 1940, the sale was 1⅓ billion; it indicates that for 1941 and we had six months actual and we used six months estimated, will be about 14 billion.

We next go to work sheet No. 9, which is also a part of this estimate, showing the estimate for the future and

there, I have shown on that work sheet that the sales for 1941 will be 13 billion; 1942—14 billion; 1943—14 billion 300 million, and so on, with a very gradual increase over the years.

I have not estimated any great increases in that territory, on the theory that we are now serving almost all of the market that is available to natural gas pipe line.

Q. I note that your have an increase of one million M. c. f. in 1942 over your 1941 estimate, whereas, in subsequent years through to 1946, your increases are approximately three to five hundred thousand M. c. f. Can you explain that situation?

A. I can. The rate of increase at present is sufficient to justify, in my judgment, an increase of one million M. c. f. between 1941 and 1942. Past history supports that.

Now, as for the future, I do not see anywhere in the territory justification for assuming that the rate of increase will be as rapid as it has been in the past.

Therefore, the increase of 1943 over 1942 will be considerably less than 1942 over 1941. It is just a matter of not [fol. 3216] having the business there.

Q. Are the sales shown in Lines 20 and 21 to the industrials west of Dana for all of the years shown in Exhibit 40, sales to presently connected customers, or does your estimate contemplate sales to other customers as well?

A. Almost in their entirety, I would say as much as 95 percent are to be made to presently connected customers. You can see that the increases, as I have shown down through the years, are very modest.

Therefore, you would naturally judge from this that there isn't going to be a great increase in the number of new customers. I suspect, sitting here studying this estimate, that it is too conservative.

Q. Will you submit the work papers for this latter estimate, please, which are, I believe, Nos. 8 and 9?

A. Yes, I will be glad to.

Q. Now, that leaves one more: And that is the domestic and commercial sales west of Dana shown in Lines 22 and 23. Will you please explain the method followed by you in arriving at these estimates?

A. That is a companion estimate to the one that we have just discussed. We talked about the industrial west of Dana and now we come to the domestic and commercial sales west of Dana on the system of Panhandle Eastern and Illinois Natural Gas Company, main line only.

[fol. 3217] We have in our records, and I show here on the work sheet, which is No. 10, the sales which we made to that class of business in 1938, 1939, and 1940, and it is noted that the growth per year is about 500,000 M. c. f. I do not see ahead of us in that territory any rapid expansion of our facilities or any large cities to be added other than, I might mention, Bloomington and Normal and Galesburg, Illinois.

As I say, I do not see any great expansion ahead of us, so I have merely estimated a flat increase of approximately 500,000 M. c. f. per year. The supporting statistics are a little more in detail than they have been on some of those estimates farther to the east, as you will note from the work sheet No. 10, probably due to the fact that we have at our finger tips there in the Kansas City office considerably more data on the characteristics of these sales than we do some of the sales farther east.

My work sheet shows that I estimate the customers to increase from 145,000 which they are approximately at this time—

Mr. Culton: (Interposing) You mean the customers of the distributing company?

The Witness: The customers of the distributing companies. From 140,000, instead of 145,000, from 140,000 as they are at present to 145,000, 150,000, 155,000 and so on, increases of about 5,000 customers per year which is purely a judgment figure, and I believe that is all that I have to offer unless you have specific questions on that.

[fol. 3218] By Mr. Littman:

Q. What are the work sheets for Lines 22 and 23?

A. That is covered by work sheet No. 10.

Q. Will you please submit that along with the others?

A. Yes, sir.

Q. Referring to the lines which are called Max-Day in Exhibit 40, are the amounts shown in those lines the ac-

tual maximum day expected for each class, or does it merely represent the contribution expected by each class on the expected peak day? Which is it?

A. The record I am quite sure is clear on that point, because on direct examination I testified, and I am repeating again, the maximum days shown on this estimate are the contributions of the respective loads to our system.

Q. Did you make any estimates of the actual peak loads to be expected for each class?

A. No, I dealt strictly in terms of the contributions on our maximum day.

Q. Now, do you have any further working papers in support of your estimate shown in Exhibit 40 which we have not called for, Mr. Morton?

A. I made none. These are the only working papers which I made, except, of course, scratch sheets upon which I made additions and threw in the waste basket.

[fol. 3219] I purposely retained them all because I knew you would want to have a good, clear record of what was done and how it was done.

Q. Now, Mr. Morton, in your judgment as rate engineer of Panhandle Eastern Pipe Line Company, do you expect these sales shown in your Exhibit 40 to be made, in fact, in the years 1941 to 1946, inclusive?

A. Yes, I do.

Q. And, in your judgment, this estimate is conservative, is it?

A. No, I am not going to tell you that. This is right on the nose as far as I know. It is not conservative nor is it the opposite. I think these are exactly the quantities that will be sold.

Of course, when I say "exactly," you understand what I mean: That this is exactly my estimate but that, of course, that they may be wrong 5 percent one way or the other or 10 percent.

Q. Up or down?

A. Up or down.

Q. Mr. Morton, I believe you testified on direct examination that you had prepared this estimate originally for the purpose of advising the management of the sales that might reasonably be expected in the next five years. Is that a correct statement?

[fol. 3220] A. I recall very well, and I am glad that you brought up that subject.

The inference of the question, although it did not show in the record, the accent upon the words when the question was asked me, left the impression in my mind that the interrogator wished to know whether we had warped this estimate for the purpose of establishing some point before this Commission and I hastened to add that the estimate had been prepared—I cannot recall the exact words—but I denied that there was anything special about it.

Now, I would like to make a complete statement about this: This estimate is made in response to a request from the management to me. The management requested me to make this estimate knowing that this rate case was coming up.

They wanted me to set the figures down in my own way and as honestly as I could, those were my instructions, to make an honest, straight-forward estimate of the sales for ten years because, they said, "We think we are going to need it in this rate case".

That was the way the assignment came to me, long before we had made our plans as to what our defense would be in this case, at one of the early meetings, so I sat down and I started building up an estimate for a ten-year period for use in this rate case.

* * * * * * * *

[fol. 3221] Q. Have you, at any time, made any estimate of the revenues expected to be derived from the sales shown in Exhibit 40?

A. I had no occasion to do so, and did not do so.

Q. Have you made any estimate of sales on behalf of the management with respect to future years.

A. I have not had occasion to advise the management except in so far as 1942 is concerned. I have, within the last few weeks, prepared our budget for 1942 of the sales that we expect to make, with the revenues.

Q. In other words, you have an estimate of the 1942 revenues? A. Yes, I do have.

Q. You do not have such an estimate for 1943?

A. No, I do not.

Q. I presume your 1942 estimate of revenues is predicated on your Column D in Exhibit 40, is it not, or something close to it?

A. It pretty closely approximates Column D in Exhibit 40. I was a little surprised to find out how close it did come, having been made four or five months after this [fol. 3222] one. You understand, don't you, that if I would make another estimate today it would necessarily be different from this one that we are looking at.

Trial Examiner: Mr. Morton, may I ask whether the company has maintained an active sales promotion policy during recent years throughout the territory served by Panhandle Eastern?

The Witness: Mr. Examiner, that is a question that goes to management. I might just tell you what I think of it, though, since you have asked me, but I wish you would please understand that there is always danger in a rate engineer's testifying for the management's policies.

We maintain, what I personally think is an active new-business policy. That is merely personal opinion. I think that we work hard at getting new business.

Trial Examiner: Is that true throughout the system? In other words, do you try to pick up industrial and commercial customers wherever possible throughout the system?

The Witness: Yes, we do. We work at that thing, whether it is on Panhandle Eastern property or some of the distributors' property.

Trial Examiner: So that, your answer to my question would be that you have maintained an active sales promotion policy in recent years?

The Witness: Yes, sir.

Trial Examiner: Throughout the system?

[fol. 3223] The Witness: That is my opinion.

* * * * * * * *

Trial Examiner: I was going to simply ask again the question that was asked yesterday, whether your estimate of future sales contemplates the continuance of an active sales promotion policy throughout your system.

The Witness: Yes, it certainly does. Now, when you tie that to my estimate, why, I feel a little bit better than answering to these policies about the company.

Trial Examiner: And your estimate contemplates what you consider the maximum safe estimate of expansion based on a continuance of present policies?

The Witness: Yes, it does.

Trial Examiner: And it takes into account also, the ability of your company to fill the demand if your estimate is correct?

The Witness: Yes, it does.

* * * * * * * * *

By Mr. Littman:

Q. Mr. Morton, I believe you said if you were making this estimate today you might have a different result. Would you expect the result to vary materially from that which you show in Exhibit 40?

A. I would not. Some of those years would be up and [fol. 3224] some down, I suspect. I know some of the accounts would be up and some down.

Q. But over-all, it would remain more or less the same?

A. That is true.

Q. Now, how did your most recent 1942 estimate compare with that which is shown in Column D of Exhibit 40? Was there much variation up or down?

A. There was not over 3 percent variation up or down.

Q. Was it up or down?

A. It was down. Some sales have not materialized as rapidly as I anticipated last August and the reason is quite apparent. Our inability to get shipments of pipe is going to delay us beyond the period when I expected that we would be able to start making these sales up there in Michigan shown on Lines 5, 6, 7, 8, 9, of this study.

That Michigan situation has moved back six months, I would say, due to our inability to get pipe shipments. Of course, at the time I made this, things looked a good deal rosier. As I say, it was early August.

Mr. Culton: That is so far as getting pipe is concerned?

The Witness: Yes, sir.

Mr. Culton: That is what you mean by "rosy"?

The Witness: Yes, sir, that is what I mean by "rosy".

By Mr. Littman:

Q. The picture, in so far as it concerns the sales of [fol. 3225] gas still looks about as rosy today or more so than it did before? A. It does.

. . . . . .

[fol. 3227] By Mr. Littman:

Q. I will ask you this, Mr. Morton: Whether or not you have at any time prepared any estimate of revenues for the years 1943, 1944, 1945 and 1946, or any one of those years?

A. I honestly do not know whether I have done so or not. Now, there are occasions, as you know, when I am requested to make up this kind of estimate or that kind of estimate. That is my business, this estimating.

I want to say this to you, that there is not existent in my office, nor have I made an estimate that you could put alongside of this one here and compare it with this one.

In other words, your question, and I have heard it before, sounds like you would like to know if I have made estimates as a regular routine thing for the management to keep them advised, in a form about like this, for three or four years—

Q. (Interposing). Referring to Exhibit 40?

A. Yes, referring to Exhibit 40, for three or four years in advance. We do not carry such a thing. We only work one year in advance. That is all we need to work, one year in advance.

Now, every fall, as I have said before, we go to work and we prepare budgets covering the next year's work and we prepare all of that stuff in detail, but we do not have an [fol. 3228] estimate anywhere in the office, nor have we ever had, so far as I know of, anything like this that we are talking about, this Exhibit 40 and its supporting papers.

Q. Well, I was not necessarily referring, Mr. Morton, to an estimate that you could lay side by side with exhibit No. 40 and say this is the revenue for this, that or the

other class. I had reference, when I referred to the years 1943 to 1946, inclusive, whether you had submitted any estimates to your company of revenues to be expected in those years from sales to, for example, Consumers Power Company or this, that, or the other company.

Have you ever submitted such estimates?

A. I have submitted estimates to them covering Greenfield and Bloomington and Galesburg for three or four years in advance, little individual projects like that.

Now, on this Consumers Power, I did not make up any other estimate myself on Consumers Power, but an estimate certainly was made up on Consumers Power and, as you see here, from these work sheets in my file.

I have looked at it. I do not know how many years in advance it is. * * * To answer your question, I know of no estimates that I have made around that office for future years for any project except the smaller towns like those I have mentioned.

[fol. 3229] Q. Mr. Morton, you could estimate, could you not, the revenues expected to be derived by Panhandle Eastern and subsidiary company from the sales shown in Exhibit 40 based on present rate schedules, could you?

A. I could.

* * * * * * * *

[fol. 3230] Trial Examiner: The Trial Examiner has several times wondered exactly the field the Defendant has opened up by asking for inclusion in the future rate base the estimated cost of future construction and future betterments.

[fol. 3231] Mr. Culton: Mr. Examiner, at the proper time the Defendant will not insist that the future construction which will be required to produce additional volumes of gas is necessary for consideration in determining whether or not the present rates are excessive.

It will insist that the additional costs required to produce and transport the same volumes of gas now being produced and transported are matters that should be taken into consideration in determining whether or not the rates are excessive.

It does take the position, and will take the position at the proper time, that the future capital expenditures required for the purpose of producing and transporting additional quantities of gas are necessary for consideration of the Commission in determining the return which the Defendant company should be permitted in the future in order to attract capital necessary for the making of these additional expenditures.

Relating this case to the Chicago case, I point out that in the Chicago case the line was already loaded and the future capital expenditures were not expenditures for the purpose of producing additional quantities of gas but expenditures required for the purpose of carrying on the then-volume of business, and that is the contention which we make in this case, that in determining whether or not the present rates are excessive, the Commission should take into consideration the expenditures which will be required in the future to produce, transport and dispose [fol. 3232] of the same volumes of gas now being handled and that the capital expenditures required for additional volumes of gas are for consideration in determining rate of return, as such. That is, the number of dollars we are going to be required to go to the public for and get in the future.

Mr. Littman: If your Honor please, it seems to me that the picture Mr. Culton paints will be incomplete without the data with respect to the revenues to be derived from these increased sales.

* * * * * * *

[fol. 3233] O. W. Morton, the witness under examination at the time of the taking of the noon recess, resumed the stand and testified further as follows:

Cross-Examination—Continued.

By Mr. Littman:

Q. I believe that at the noon recess I was stating the reasons for the request which I made of this witness to supply, first, his estimate of revenues to be derived from sales of gas shown in Exhibit 40, which estimate, according to the testimony of this witness, was prepared and is

in writing, and is in his office, and he expects to submit it to the company as his estimate of revenues for the year 1942; secondly, I request that this witness submit an estimate of the revenues expected by him to be derived from sales of gas shown in Exhibit 40 for the years 1943 to 1946, inclusive.

. . . . . .

[fol. 3234] Mr. Wheat: The gross revenue which will result from the application of the figures shown by the wit-
[fol. 3235] ness in Exhibit 40 for these respective years, based on the present rate schedule.

By Mr. Litman:

. . . . . .

A. On this exhibit I have plotted cost of gas plant against total annual sales on the system; the scale applying to gas plant reads in the millions of dollars, and the scale applying to annual sales is in billions of cubic feet. It will be noted that the sales over the past three years have increased at the rate of approximately 7 billion cubic feet per year.

The only significance that I personally am able to draw from this is the fact that in the light of the performance of the past few years, the estimate for the future, with respect to annual sales in M. c. f. is not out of line. In other words, our past performance indicates that we
[fol. 3236] have been growing very rapidly, at the rate of about 7 billion cubic feet per year, and this detailed study of future years, this estimate of mine, Exhibit No. 40, shows about that same growth, so that is about the only significance that I attach to this Exhibit 41.

Q. Now, what is the source of the figures for the curve "Gas Plant—classified?"

A. That is the book records of the company, and the statistics supporting that curve are shown in one of Mr. Watkins' exhibits. I have merely plotted some of the figures that have been hitherto offered in this case.

Q. I will hand you a copy of Mr. Watkins' Exhibit 52, and ask you whether page 2, line 38, of that exhibit, entitled "Total Gas Plant—classified," shows the figures that you have used for that purpose in your chart, Exhibit 41.

A. They appear to be identical; these appear to be the figures I used.

Q. In other words, you can't tell from the chart the exact dollars nearly so well as you can from this exhibit?

A. That is correct; for all practical purposes these are the figures.

Q. Yes. Now, are the figures representing the curve "Annual Sales" the same as those appearing in column "Q" of Exhibit 58; and I hand you a copy of Exhibit 58?

A. They are.

. . . . . .

[fol. 3237] Q. The Examiner has asked you about sales promotional work, and I would like to ask a few additional questions with respect to that:

Now, your company sells only to utility and special industrial companies, does it not?

A. Yes, that is true.

. . . . . .

[fol. 3239] Q. Well, you expected then a vigorous sales promotional activity to get the results that you set out in Exhibit 40, did you not?

. . . . . .

A. (Interposing) I expect some of those results will come about without the necessity or without the assistance of a vigorous sales campaign, but I believe the total would be achieved only through it, and that is what I was referring to; the total would be achieved only through some vigorous sales promotion policy.

. . . . . .

[fol. 3240] Q. Now, does that sales promotional department spend its time soliciting and adding new business or in retaining its old business?

A. Our sales efforts are directed to both; we have no sales department as such, so I can't answer your question as respects a sales department, but the promotion efforts of our company are directed along the lines of retaining the old business and adding new customers.

Q. In allocating that expense, however, you have allocated all of it to unused capacity, did you not?

A. In this unused-capacity study, I regarded sales promotional expense as just as much an expense of doing business as any of the other expenses, and I did include it in my calculation of operating expenses attributable to unused capacity, but I didn't use the entire amount in the final answer.

[fol. 3241] Q. You didn't use the entire amount?

A. No. I started with the total amount, but when you finally come through to the final figure which appears away over on the right-hand column, around $5,500,000, only a fraction of the expense attributable to sales promotion finds its way into that figure.

Q. What proportion, then, finds its way into the final figure?

A. I would say very close to 50 percent, during those early years. In other words, I say by this study of mine, using the 1938 unused capacity, I say that in my opinion, in the opinion of the estimator, that 50 percent of certain operating expenses during all these early formative years was attributable to unused capacity, and in this expense is listed what we refer to as business promotion.

Q. Now, I take it that you feel it would be necessary for a distributing gas utility to maintain a sales department just the same as your own?

A. Undoubtedly that is true.

Q. And that results in a double loading on the public, or the gas consumer, does it not, in that there is a loading of expense in which you seek to promote sales to the distributing utility, and again when the distributing utility seeks to promote sales to the public: Is that correct?

[fol. 3242] A. I think I would object to the use of the term "loading on the public." In all business there is expense connected with its operation, and we all know that the public finally bears the expense of running a utility, in our case, and in your case in Detroit the same as in our line; so I think it is a little unfair to ask a man to testify that we are loading on the public some double charges because we maintain sales promotion efforts in both our transmission lines and in our distribution efforts.

Q. I am asking you just the plain fact whether or not that constitutes a double charge or loading on gas consumers for sales promotion.

A. I have explained my position and I think I made my answer clear to that question.

. . . . . .

[fol. 3281] By Mr. Chamberlain:

Q. Now, referring to your Exhibit 38, you spoke of attempting to ascertain the cost of the unused capacity in the main line. What did you mean by that?

A. I meant by that, that in my judgment, there was a period during the operating of this pipe line when it was operating at considerably less than its designed capacity or the capacity for which its [designors] had built it, and that it cost the company some out-of-pocket money to carry this unused capacity over what I have termed the lean years and that these costs, consisting of actual out-of-pocket interest, ad valorem taxes and certain operating expenses, were incurred because of such unused capacity and I attempted in this study, of course, to make a mathematical calculation on five different methods as to what those costs attributable to unused capacity should be.

Q. Let me put it this way, or let me put a question this way. In the letter which you directed to Mr. Neuner and which you read into evidence yesterday, your suggested that, in arriving at going value, recognition should be given to the fact that the company had, during its early years, idle capacity, and now I quote: "which has been made in advance of the time when it was to be used because it was economical to do so."

Now, will you expand on that a little bit and give us your [fol. 3282] rationalization of why you should have an allowance for the unused capacity of the transmission line?

A. I think it is quite clear Mr. Chamberlain, to all of us, and I think you probably have heard Mr. Biddison explain this same thing, that it is impossible to build what we term a "rubber pipe line" that would expand with the increasing markets.

It would be uneconomical to build a 4-inch line to carry the first year's business and an 8-inch line to carry the second year's business, and so on.

The designers of this pipe line system apparently expected to get a load that would fully fill a pipe line of 24,

22 and 20 inch capacity, so they built one of that size, expecting to fill it with gas because it was economical to build a pipe line that size.

They only put three compressor stations on it, but it was designed for 11. So, during those early years, when it had those three compressor stations on that size line, it had a capacity of only 80 million cubic feet.

That was all the gas it could carry. Later on, when they added the full complement of the compressor stations, it had a capacity of 125 million.

Now, in that interval between the time they built that line and the time it started carrying its full load of 125 million, there was some unused capacity in the line and it was [fol. 3283] the cost of carrying that unused capacity that I tried to measure here in dollars and cents.

. . . . . .

Q. Well, is it fair to say that you are approaching it from the standpoint of a distributing electric utility which is building a large power plant and over-building for the present time to take care of what would be reasonably anticipated for its future needs?

A. Well now, there are some points of similarity in the two things, but there is more flexibility in the case of the power plant than there is in the case of the thing we are talking about.

They can expand gradually as the load comes on. They do not have to install all the capacity needed to carry their final load at the outset. There is some similarity, yes, but [fol. 3284] the degree is considerably different, as I say.

. . . . . .

[fol. 3291] Q. Mr. Morton, what is the relative capacity of a pipe line, let us say, one twice the diameter of the other?

. . . . . .

[fol. 3292] The Witness: I think Mr. Chamberlain means what is the carrying capacity at certain pressures or at any given pressure in a pipe line, let us say 2 inches as compared with one having a diameter of 4 inches.

By Mr. Chamberlain:

Q. Yes.

A. What is the relationship of diameter to capacity. Now, I cannot answer that from memory, Mr. Chamberlain. I could tell you this much, that it is not a very hard job, but that it would probably take 10, 15 minutes, maybe, for me to work out enough information to satisfy myself that I had answered that correctly from Weymouth's formula.

The capacity of the pipe line varies, not directly with the diameter, but as some power of the diameter and, for the moment, the power has escaped me, but I believe it is the eight-thirds' power of the diameter so that, if my recollection is correct, then the pipe line that is twice as large as the other would carry 2 D to the eight-thirds' power—well, [fol. 3293] it is diameter to the eight-thirds power as compared to the other diameter to the five-thirds power.

. . . . . .

Q. All right. What I am trying to get at is, there is an economy and a very substantial economy, if you were going to develop the given capacity, by building one large main instead of two small ones which would afford you the same capacity?

A. Yes, there is economy in building the larger pipe line, of course.

Q. You were using a rule-of-thumb here yesterday. Now, you know the rule-of-thumb by which these natural pipe lines have been projected and talked about. What has been used in the industry as [a] example of the cost of building a pipe line per inch of diameter per mile?

A. I am sure you are speaking of the $1,000 per inch of diameter.

[fol. 3294] Q. That is right. Then a 10 inch line under that rule-of-thumb would cost about $10,000 a mile, is that right?

A. Yes, under that rule, that is right.

Q. Whereas a 20-inch line would cost about $20,000 a mile? A. Yes.

Q. And the one would have, to be very careful, three to four times the capacity of the other one, would it not?

A. Yes, sir, correct.

. . . . . .

[fol. 3295] Q. If you had a load of 40 million feet of gas a day and you wanted to build a pipe line with a capacity of 80 million, what proportion of the cost would be for this excess capacity?

A. It would depend entirely on what you wanted to make it, whether you wanted to approach it on a straight proportional basis or on the increment cost basis. There are arguments both ways.

* * * * * * * * *

[fol. 3302] Q. All right. Now, land rights and land, did you buy any greater right-of-way than you would have, had you had a line of half the capacity?

A. Now, that I cannot say because I did not go, as I say, into the individual accounts that go to make up this story. I just tackled it from an over-all standpoint.

Q. Don't they have a standard right-of-way for these natural gas pipe lines?

A. I guess I sound dumb, but I don't know that.

Q. You do not know that, but supposing I put this to you and see if you know this. Would it require a wider right-of-way to lay a 24-inch main than a 16-inch main?

A. I do not know.

Q. You know you have paralleled your lines in many cases on the same right-of-way that you had to start with?

A. I know we have paralleled the line, all right, but I do not know about the right-of-way arrangements.

* * * * * * * * *

[fol. 3303] Q. Now, I understood your testimony yesterday that you were attributing to unused capacity, let us say just abstractly, 55 percent of the general and administrative expense covering the 4½ year period. Is that in general right?

[fol. 3304] A. In general, that is true.

Q. Now, rather than state what I understood, will you state again your reason for allocating that proportion of the general and administrative expenses to unused capacity?

A. That goes back to the entire conception of what the study is for.

Q. You are talking about your study?

A. Yes. As I stated many times before, we built a pipe line which was intended to take care of a certain load because it was economical to build a pipe line of that size.

Now, during the early years of the project, it did not carry the load for which it was designed and by five different mathematical ways, I have indicated what percentage of the project I thought was not being used during those early years, and I attempted, by use of those percentages, to arrive at what seemed to me to be fair measures of the cost of carrying unused capacity, and those costs consisted of interest charges, ad valorem taxes, and operating expense.

There may have been others, but those are the only three that I used.

The reasoning generally was this, and I am getting closer to your question, that since there was, let us say, 50 percent unused capacity in this project during, let us say, 1934, then it followed that 50 percent of the expense of running this big project could be allocated reasonably [fol. 3305] to this unused capacity.

Of course, we did not take 50 percent of all of the operating expenses because we realized that some of them would cause a good deal of argument if we put them in here and it would be a little difficult to justify something that, right on the face of it, had no connection with unused capacity, so we threw out some of them but, in general, that is what we did.

Since we had 50 percent unused capacity during those years, I took 50 percent of certain operating expenses as having been incurred on account of keeping in running shape this project.

Q. Well, you took the 50 percent of general and administrative expenses, did you not?

A. Yes, I did.

Q. And that was on the theory that you were staffed with sufficient employees to operate a plant transporting its full capacity, is that right?

A. I do not know whether that exactly applies or not. I think about all we could say about that is, that since it appeared that 50 percent of our capacity during those years

was not being used, then 50 percent of our expense during those years was there because of unused capacity.

Q. Well now, let's apply that a little more concretely. That includes the salary of the president, does it not?

A. Yes, undoubtedly that did.

* * * * * * * *

[fol. 3310] Mr. Littman: Mr. Examiner, in accordance with our usual policy of endeavoring to clear up the situation with respect to exhibits as each witness completes his testimony, I would like to make a statement with respect to the exhibits of Mr. Morton.

We have no objection to Mr. Morton's Exhibit No. 40, "Estimated Main Line Sales, Years 1941-1946, Inclusive."

We have no objection to Mr. Morton's Exhibit No. 41, which is a chart entitled, "Panhandle Eastern Pipe Line Company and Subsidiary Companies-Sales and Gas Plant by Years".

We do, however, renew our objection to Exhibit 38, which was submitted by Mr. Morton. I have stated on this record the basis of our objections to Exhibit 38. Briefly, to reiterate our position, it is simply this:

We object to any evidence in this proceeding relating to a separate allowance for going concern value. We believe that such a separate allowance will not need to be made in this case so, in the first place, we reserve our objection on that score throughout the entire proceeding.

Secondly, the evidence submitted by Mr. Morton cannot conceivably furnish a proper basis for going concern value. As we have already stated, the exhibit simply undertakes to allocate a portion of past operating expenses, [fol. 3311] and past taxes and past interest to a so-called total which this witness calls "attributable to unused capacity."

This so-called capacity has no relation, in our opinion, and I believe in this witness' opinion, to the physical capacity of this pipe line system. It includes expenses which are obviously unconnected with any unused capacity of the pipe line system.

Some of those, as your Honor will recall, are distribution system expenses incurred in connection with the operation of distribution systems which are not even now owned by Panhandle Eastern Panhandle Pipe Line Company.

They include the cost of reading meters in communities in Kansas and Missouri, the cost of repairing services and mains, the cost of advertising, the cost of soliciting customers. It includes an unascertained amount of interest paid by a number of subsidiary companies whose operations had nothing to do whatever with the operation of the main pipe line system which is the subject of this proceeding.

But assuming that all of those expenses were proper and could be capitalized into a rate base under the guise of going concern value, we believe that the evidence fails to support the method used by this witness to arrive at the amounts properly applicable or attributable to unused capacity.

Those, briefly stated, are the grounds for our objection. We believe that this exhibit, namely, Exhibit 38, should be [fol. 3312] excluded.

Trial Examiner: Some reference was made yesterday to further data that had been requested of Mr. Morton and I would like to know whether the data, which, I assume have not been furnished, will have reference to Exhibit 38?

Mr. Littman: Those data will not affect Exhibit 38. Those data relate to Mr. Morton's Exhibit No. 40 and possibly to No. 41, but particularly to Exhibit No. 40.

In other words, we merely want the underlying working papers for Exhibit 40. I believe that counsel on the other side of the table will agree that Mr. Morton's working papers to be furnished, and additional data, such as estimates of revenues, do not have any relation to Exhibit 38 but relate particularly to Exhibit 40.

Trial Examiner: Referring to Exhibit 38, I will ask counsel for Panhandle Eastern Pipe Line Company whether the sums shown in Line 26 comprise merely a part of the sums which have heretofore been charged to the operating expenses of the company and its subsidiaries?

Mr. Culton: They include those items, save and except the excepted items relating to Argus, the Local Area and the transportation of gas.

Trial Examiner: But they do constitute a part of operating expenses which have been charged, as such, on the books of the company?

[fol. 3313] Mr. Culton: That is correct.

Trial Examiner: And the segregation of a part is only for the purpose of allocation to estimate what you term "the cost of developing the business"?

Mr. Culton: That is right, the cost of carrying the unused capacity.

Trial Examiner: Exhibits 40 and 41, so marked for identification, will be received without objection.

. . . . . .

Trial Examiner: The objections of Commission Counsel to the reception of Exhibit 38 will be overruled and this exhibit will be received for what it may be worth, although there is, in the view of the Trial Examiner, considerable merit in the objection.

The fundamental bases stated in the objection will, of course, be given consideration when the evidence is reviewed.

. . . . . .

[fol. 3316] P. McDonald Biddison, a witness, having pre-
[fol. 3317] viously been duly sworn, resumed the stand and testified further as follows:

. . . . . .

[fol. 3334] Mr. Littman: I wanted to be straightened out on just what Mr. Biddison was referring to when he referred to the cost of developing the business, whether he was referring to the two items or one; namely, payments to utility companies and, carrying costs on that portion of plant idle pending development of business.

. . . . . .

The Witness: I refer to the sum of the two.

By Mr. Wheat:

Q. As used by you in your exhibit what?

A. Well, I have used it in Exhibit No. 39 and I have used it in Exhibit 62.

Q. At least, you have used it in those two exhibits which already have been made the subject of a refusal order by the Trial Examiner, is that correct?

A. That is correct.

. . . . . .

[fol. 3574] P. McDonald Biddison, a witness, having been previously sworn, resumed the stand and testified as follows:

Redirect Examination (Continued).

. . . . . .

[fol. 3579] Mr. Littman: (Interposing) Pardon me, Mr. Culton.

Do you mind if I ask one question to clear up something?

Mr. Culton: Go ahead.

Mr. Littman: Mr. Biddison, with respect to the breakdown by you just referred to in Exhibit 39 from Page 156 to 350, did you use that breakdown in connection with making your determination of depreciation?

The Witness: Yes, sir, I did.

Mr. Littman: To what extent? Would you mind telling us to what extent you used that breakdown?

The Witness: This equipment in Exhibit No. 39 is summarized by classes of use and location on Page 155 of Exhibit No. 39.

That summary is a summary of the data on the succeeding pages which details the installations and that summary on Page 155 is the data shown in Column B and Column A on Page 19 of Exhibit 62, and it is the data to which, in my working papers, I made application of the figures of percentages to be deducted for depreciation.

Mr. Littman: Do I understand that you arrived at a percent of depreciation for each and every item of equip-
[fol. 3580] ment listed on Pages 156 to 350, inclusive, of Exhibit 39?

The Witness: I do not know whether you understand that or not, but I want you to distinctly understand that you should not understand it that way, because I have explained it otherwise.

I determined an amount in percentage to be deducted for depreciation for each class and location of property in the recapitulation sheet on Page 19 of Exhibit 62.

Mr. Littman: In other words, you worked from the recapitulation sheet shown on Page 19 of Exhibit 62, rather than from the details shown from Pages 156 to 350?

The Witness: That is right. The things which I saw are the details which are shown in the various pages of Exhibit No. 39.

The things to which I applied my percentage, resulting from those observations, are the items appearing in Column B on Page 19, Exhibit 62.

. . . . . .

[fol. 3638] By Mr. Wheat:

. . . . . .

[fol. 3639] Q. Now, Mr. Biddison, when approximately did
[fol. 3640] you make the inspection to which you have testified with respect to the company's pipe line.

A. This inspection began, starting from Amarillo on August 17, 1941. I continued over the system to its eastern end, returning to Kansas City upon August 26, 1941.

I did not do any inspecting on Sunday, the 24th of August nor upon Thursday, the 21st of August. I did, at a later date, however, inspect Louisburg compressor station and Olpe compressor station.

Q. Did anyone accompany you on this inspection trip?
A. Yes, sir, I was accompanied by two engineers.
Q. Please state their names.
A. Of the Federal Power Commission's staff.

Q. Who were they?

A. Mr. Shattuck and Mr. Bodner, except they did not accompany me upon my inspection of Louisburg station and Olpe station.

Q. Now, prior to the commencement of this inspection trip on August 17, 1941, at Amarillo, Texas, had there been any discussions of such an inspection and, if so, what were they, and please detail for the record what the situation was in that respect?

A. I began work on this Panhandle Eastern situation in preparation for this hearing on July 22 at which time I attended a conference in Kansas City.

. . . . . .

[fol. 3641] Q. Generally, who was present and what was the nature of the conference?

A. I cannot give a list of those present because I do not have such a list.

Q. Do you remember, in general, who were there?

A. Well, I know, of course, that I was there, and that Mr. Burnham was there, Mr. Creveling, the president of the company; Mr. Paxton.

Q. Who is Mr. Paxton?

A. He heads their accounting force from Kansas City. He is secretary and treasurer, I believe, is his title.

Mr. Neuner, the operating vice-president, was there. I believe Mr. Glenn Clark, the company's attorney, was present at the conference, and I believe Mr. Carl I. Wheat and Mr. Don Culton were present at that conference.

. . . . . .

Q. Yes. What was the general nature of the conference?

[fol. 3642] A. The general nature of this conference was to discuss the question of how to prepare for this hearing on which a date had been, at least tentatively, set.

Q. And was anything discussed at that conference with reference to the inspection of the company's physical properties for the purpose of determining the amount of depreciation or loss of value which had occurred therein?

A. Yes, that matter was discussed, and it was understood, as a result of that conference, that I would make the inspection and that the representatives of the Federal

Power Commission would be given an opportunity to see, during that inspection, whatever I saw.

Q. Do you know, Mr. Biddison, whether a communication was addressed by the Panhandle Eastern Pipe Line Company to the Federal Power Commission in connection with or inviting representatives of the Commission to accompany you on this tour of inspection?

A. I know it was understood at that conference that that would be done and that subsequent events indicated the invitation had been extended.

Mr. Wheat: I would like, Mr. Examiner, to read this short letter into the record and I will hand the copy to the reporter and it is understood with the Commission that if, on examination, it does not check with the copy they received, we will discuss the matter and make the check.

[fol. 3643] Trial Examiner: Very well.

Mr. Wheat: All right, sir.

This is dated July 23, 1941.

"Federal Power Commission, Washington, D. C.

Attention: Mr. Leon M. Fuquay

Re: City of Detroit and County of Wayne vs. Panhandle Eastern Pipe Line Company and Michigan Gas Transmission Corporation—Docket No. G-200.

"Gentlemen:

"In connection with the above proceeding, Mr. P. McDonald Biddison, Consulting Engineer, Dallas Gas Building, Dallas, Texas, is making a valuation of our physical properties. Commencing on or about August 4, he will make an inspection tour for the purpose of determining the present condition of these properties, and during this tour he will inspect portions of our pipe lines which are to be uncovered at various locations designated by him.

"Thinking that the Commission, through one of its engineers, might wish to observe the condition of these properties in connection with this case, or in connection with its own investigation under Docket No. G-207, we invite you to designate some member of your staff to accompany Mr. Biddison on this tour. His transportation over our

system would be provided by this company and should he desire to inspect portions of our pipe lines not uncovered for the purposes of this inspection tour, we will be glad [fol. 3644] to cause such other portions to be uncovered for his inspection.

"If you desire to avail yourselves of this opportunity to inspect the physical properties of this company, please give us the name and address of the one you designate to make this trip and we will have Mr. Biddison contact him as soon as possible.

Very truly yours,"

I believe it was signed by J. D. Creveling, as president of the company.

By Mr. Wheat:

Q. Now, Mr. Biddison, do you know whether the Panhandle Eastern Pipe Line Company received an answer to that letter from the Federal Power Commission?

A. Yes, I saw a reply, a telegram which I think was in reply to the letter which you have read.

Q. Well, is the letter which I show you under the letterhead of the Federal Power Commission the reply itself?

A. Yes, I have previously seen that letter.

. . . . . .

Mr. Wheat: This letter is under the letterhead of the Federal Power Commission, Washington, dated July 26, 1941.

[fol. 3645] "Mr. J. D. Creveling, President,
Panhandle Eastern Pipe Line Company,
1221 Baltimore Avenue,
Kansas City, Missouri.

Re: Docket No. G-200, Panhandle Eastern Pipe Line Company and Michigan Gas Transmission Corporation

Dear Sir:

"This is to acknowledge receipt of your communication dated July 23, inviting a member of the Commission's staff to accompany Mr. Biddison in an inspection of your properties in connection with the above investigation.

"Mr. H. Zinder, Chief of the Division of Rates and Research, will be in the field and in the vicinity of Kansas

City the week of July 28. In view of this fact, Mr. Zinder has been requested to call upon you Saturday morning, August 2, on his arrival in Kansas City and arrange for a meeting with you to discuss this matter. It would be advisable if Mr. Biddison could be present at such a meeting, so that questions or procedure on the inspection, number of inspections contemplated, and the plans generally, may be discussed. Following this conference and Mr. Zinder's report, a decision will be reached concerning the nature and extent of the Commission's participation in the inspection.

"In view of the above circumstances, it is suggested that arrangements for the commencement of the inspection be delayed from August 4 until August 18. This would permit Mr. Zinder time to return to Washington and to make [fol. 3646] whatever arrangements are necessary for some members of the staff to reach Kansas City for the start of the inspection.

"If the above arrangements are satisfactory, please confirm them by return wire.

Yours very truly,"

(Signed) LEON M. FUQUAY,
Secretary."

I have also here a carbon copy of a telegram:

from "Kansas City, Missouri,
July 28, 1941,
3:55 P. M.

Leon M. Fuquay, Secretary
Federal Power Commission
Washington D. C.

"Arrangements suggested in your letter of the twenty-sixth satisfactory. Will be glad to see Mister Zinder Saturday morning August, second.

(Signed) PANHANDLE EASTERN
PIPE LINE COMPANY
By G. J. Neuner, Vice President."

That is also subject to counsel's check.

By Mr. Wheat:

Q. Now, Mr. Biddison, as a result of the passage of letters between the company and the Federal Power Com-

mission, was a conference held in Kansas City with Mr. Zinder present?

A. Yes, sir.

[fol. 3647] Q. When was that held?

A. On August 2nd.

Q. Who was present there, so far as you can remember?

A. Mr. Neuner, Vice President of Panhandle Eastern Pipe Line Company, Mr. Glenn Clark, attorney for Panhandle Eastern Pipe Line Company.

I believe Mr. Don Culton, counsel for Panhandle Eastern Pipe Line Company in this case, was present at that meeting.

I was present, and Mr. Zinder and Mr. McAllister of the Federal Power Commission were present.

Q. Members of that Commission's staff?

A. Yes, sir.

Q. Now, will you relate briefly your recollection of what was said with respect to the inspection in question?

A. I outlined about the number of inspections that I anticipated making and I had a map somewhat similar to the map that hangs on the wall.

Q. Exhibit 15?

A. Exhibit 15 in this case, on which, on the main line system, I had indicated, generally, the locations of some of the points at which I wished to make inspection.

I explained that I was making provision for that number of inspections which I thought it would be desirable to make of such a property in case of a purchase and sale and did not propose a large number of test holes.

[fol. 3648] I advised that I had indicated, generally, certain locations upon this map and suggested that it would be advisable for representatives of the Federal Powe Commission make additional locations equal to half the locations which I had selected.

They asked for a copy—

Q. (Interposing) When you say "they," who do you mean?

A. Mr. Zinder and Mr. McAllister. Which one made the request specifically, I do not know. It was sort of a joint request that they be furnished with a copy of that map and

that the matter of locating such additional test holes would then be referred to engineering numbers of the staff of the Federal Power Commission.

Q. Mr. Biddison, right there, did they express any dissatisfaction with the number of test holes that you proposed?

A. On the contrary, both Mr. McAllister and Mr. Zinder expressed satisfaction with our viewpoint that a large number of such inspections was not necessary for the determination of the facts pertinent to this kind of an investigation.

Q. For adequate sampling of the property?.

A. That is right.

* * * * * * * *

Mr. Gorman: Do you, by your answer, intend to indicate they [they] thought that was a sufficient number and [fol. 3649] sufficient for determining depreciation in the property?

The Witness: I am not trying to indicate anything. I am simply telling what happened.

Mr. Gorman: Yes. I did not want any improper inference to be given to your statement.

Mr. Wheat: I am sure no improper inference could be drawn from the statement of the witness.

By Mr. Wheat:

Q. Was anything else said about the number of test holes?

A. Yes. A comparison was made during that discussion as to our viewpoint on that matter in the light of the large number of holes either dug or planned to be dug by some other natural gas utility having cases pending or undergoing hearing before the Commission.

Q. What was said in that connection?

* * * * * * * *

In your answer, Mr. Biddison, you said "in view of that matter." By "that matter," you meant what?

The Witness. Our view as to the matter of how many test holes were to be dug during this inspection.

. . . . . .

By Mr. Wheat:

Q. What was said in connection with this item you just mentioned, some other company having too many test holes?

[fol. 3650] A. I cannot make a quotation on that, although I can say in regard to what was said on the matter, the idea was expressed by these gentlemen that we had adopted a logical procedure in that matter.

Q. Now, you also, did you, acceded to the request made by the Commission through its secretary that you postpone the start of this investigation from around August 8 to August 17 or 18? Is that so?

A. That is correct.

Q. In the meantime, Mr. Biddison, did you send on to Mr. Zinder or Mr. McAllister in Washington this copy of this map you have mentioned and also a list of the points where you proposed to dig test holes?

A. I arranged for that map to be sent. I did not send it myself.

Q. Well, it was sent, was it not?

A. I am sure it was. Later information indicated that it had been properly received.

Q. Now, did anyone representing the Commission at any time actually suggest to you any additional places for making test holes?

A. No, sir.

Q. And did you, yourself, on your own volition increase the number of test holes by around 50 percent?

A. I did at a later date and after conference with Mr. [fol. 3651] Shattuck and Mr. Bidner, after their arrival at Kansas City.

Q. When did they arrive in Kansas City?

A. I do not have a record of that with me.

Q. Sometime after the 2nd of August?

A. I think I can give an approximate date on that. I think it was about August 4.

Q. At any rate, it was after this conference of August 2nd, was it not?

A. Yes, sir.

Q. And prior to your start on August 17 from Amarillo?

A. Yes. It may have been later than the date I have given.

Q. Did you request either of these gentlemen to make a designation of additional test holes?

A. I did.

Q. And are we to understand that they did not do so?

A. They did not do so.

Q. Now, as a result of that, did you make these additional designations?

A. I did and, in doing so, I marked them upon a map from which the station and plus number could be identified in the presence of Mr. Shattuck and Mr. Bodner.

Q. You mean, you marked them on the map in the presence of those gentlemen?

A. Yes, sir.

[fol. 3655] P. McDONALD BIDDISON a witness, having been previously sworn, resumed the stand and testified further as follows:

Redirect Examination (Continued)

By Mr. Wheat:

Q. Mr. Biddison, at the close of the hearing yesterday, you were discussing the program which you had developed for the examination of the pipe lines of the Panhandle Eastern Pipe Line Company in conjunction with certain members of the staff of the Federal Power Commission.

Now, I wish you would proceed with your discussion of what you did and particularly with respect to the digging of various test holes for the examination of the line and its condition.

A. When it developed that the engineers for the Federal Power Commission, Mr. Shattuck and Mr. Bodner, would not select additional locations for inspection on lines above the number which I had already located, I myself made the additional locations in their presence.

Q. How did you go about doing that?

A. I generally divided the districts, between locations which I had already selected, into substantially equal dis-

tances and put these locations as intermediate locations.
[fol. 3656] Q. Where did you put them?

A. Intermediate locations between the locations which I had previously selected.

Q. When you say you put them, did you put them on a map or something like that?

A. I marked them on a map and marked them according to its location and plus number on the alignment sheets.

Q. This you say was done in the presence of the members of the Federal Power Commission staff?

A. Yes, sir.

Q. I wish you would state, in general, what the basis was for your designation of test holes and their locations?

A. The basis was to have a fairly uniform distribution of test holes so selected that they could be reached by automobile, in order to save time.

For that reason, the locations were made close to what appeared to be roads that could be traveled by automobile.

Q. And after you had made these locations upon this map, how was the actual mechanism of getting the test holes dug arranged?

A. An assistant tabulated these locations by pipe line districts and furnished the information to the superintendent of pipe lines, who, by letter, advised district superintendents of the location of these test holes, of the length of pipe to be uncovered, of the clearance to be provided [fol. 3657] around the pipe, of the amount of protective coating that was to be removed, and of the probable date at which they might expect us to require the holes to be ready.

Q. Was there any effort on your part or, so far as you know, on the part of anyone connected with Panhandle Eastern Pipe Line Company, to make any selection of test hole points other than as you have testified?

A. No, sir, nobody else had anything to do with it.

Q. And you made your selections solely from the map as you have testified?

A. Yes, sir.

Now, my instructions to the pipe line department were that in case any of these locations proved to be such that it would interfere with land owners' rights of property, that

they could be moved a reasonable distance without placing a specific limit on what was reasonable.

There were a few locations changed for that reason. I think one was changed because the digging would have been in very hard rock, and one or two were changed to get them out of crop locations into open field locations, but the locations were made as originally specified, with very few exceptions.

Q. Now, some questions were asked you on cross-examination with respect to the locations for inspection which you designated at certain of the river crossings.

I believe you testified that, in those instances, you in- [fol. 3658] spected pipe in some portion of the flood plain of the river at the crossing.

A. That is correct.

Q. Would it be your opinion that if there were corrosion or other deterioration of the pipe, that an examination of the pipe in such location would disclose such corrosion?

A. Yes.

Q. And would it be your opinion that if there were any corrosion in connection with the pipe in the river crossing, that an examination in the area of the river's flood plain would be the best possible place to make the examination for corrosion?

A. Yes, sir, there is more pipe, in general, on the land sections in the flood plain on these stream crossings than there is in these stream beds.

That is not true of all stream crossings, but it is of a number of them.

Q. Now, Mr. Biddison, you were also asked on cross-examination whether you made specific examination of the pipe at certain of the river crossings. It is a fact, is it not, that you arranged your examination to make inspection at certain of the river crossings, but not at all of them?

A. That is correct.

Q. Now, is it your opinion that your examination of the pipe at those certain river crossings was sufficient to give [fol. 3659] you a reasonable and fair basis for judgment as to the river crossing pipe of this company?

Q. And where is that conclusion contained in your testimony?

A. It is contained in the deductions I have made for depreciation in Exhibits 62 and 69.

* * * * * * * *

Now, will you go back, Mr. Biddison, to the time of your [fol. 3660] conference in Kansas City, at which time you made the selections of these additional locations for test holes on the map in the presence of these two members of the Federal Power Commission's staff.

What was the next step in connection with this inspection trek?

A. After completing the locations, the next step was to notify the pipe line department of those locations so they could have these holes dug.

Q. Now, about when was that done?

A. I do not have copies of the correspondence on that.

Q. I am not asking that detail, but about when was it done in relation to these conferences and the start of your trip?

A. Well, it was done within two days after the locations had been posted on the maps, and I believe prior to August 10.

I think it was sometime during the week of August 3 that notification was given to the pipe line department, to my best recollection.

Q. Yes. Now, then, what was the next step?

A. The next step was to go to Amarillo and to start inspections.

Q. Did you drive from Kansas City to Amarillo?

A. No, sir, I took the night plane from Kansas City to [fol. 3661] Amarillo and got in Amarillo about 3:30 or something of that sort in the morning and met the representatives of the Federal Power Commission in the lobby of the Herring Hotel about 6:00 o'clock on Sunday morning.

Q. That was August 17?

A. Yes, sir, and we began inspection that day in the Panhandle Field.

Q. And what did you do there?

A. We drove in automobiles to the locations in the field where I had selected spots for inspection. We had a field superintendent with us to direct us to these locations. At each location, I went down into the hole, made the inspection of the pipe, its full circumference—

Q. (Interposing) What did you do in making this inspection?

A. That is what I am trying to tell you.

Q. Let's have this in detail so the record will show just exactly what was done by you and the representatives of the Federal Power Commission.

A. I made an inspection of the pipe for its full circumference and I made an inspection of the protective coating on that pipe in each of these locations, it had been directed that there be six feet of total pipe exposed of which four feet was to be cleaned of its protective coating so that four feet of the pipe surface could be examined and two feet of [fol. 3662] the protective coating could be examined.

* * * * * * * *

Q. Proceed.

A. Now, at these locations, with a few exceptions, I made photographs of the pipe.

Q. We will come to that later, but I am glad to have you state what you did in that connection.

A. At each location, I made notations of my observations, and I have before me the forms on which those notations were placed at the time.

* * * * * * * *

[fol. 3663] Q. In other words, had the paint been removed from four feet of that six feet that had been laid bare by the digging away of the earth from the pipe?

A. That is correct.

Q. All right, proceed.

A. The inspection was by P. McDonald Biddison.

Q. Was anybody else there at the time who looked at that pipe? A. Yes, sir.

Q. Who was there?

A. Representatives of the Federal Power Commission, Mr. Shattuck and Mr. Bodner.

Now, in general, Mr. Bodner made the actual inspections of pipe and Mr. Shattuck made the notations di-

rected by Mr. Bodner to be made. In other words, Mr. Shattuck generally kept the records and Mr. Bodner generally made the direct inspections of the pipe.

. . . . . .

[fol. 3664] Q. Now, Mr. Biddison, before you proceed in connection with this photograph, did you take photo-
[fol. 3665] graphs at all or practically all of these test hole locations?

A. I did. There were one or two locations where I did not attempt to take pictures because of darkness, but, except for that, I attempted to take pictures at each location and I do have such pictures, with a few exceptions. I did not have a perfect score on it, but a pretty good batting average.

. . . . . .

[fol. 3666] Q. All right. Now, how many inspections did you make of the pipe of this company? A. 116.

Mr. Littman: May I inquire if that represents the total number of inspections made by you on all types and kinds of pipe?

Mr. Wheat: That is what I meant by my question. I wanted that answer.

The Witness: Yes, sir.

By Mr. Wheat:

Q. How many was that? A. 116.

. . . . . .

[fol. 3667] Q. Were the representatives of the Federal Power Commission staff present at all of your inspections?

A. Yes, sir, at every one.

Q. Did they also make notations, to your knowledge, at each one of these locations? A. Yes, sir.

Q. Did either one of them actually inspect the pipe at those locations?

A. Yes, sir, there was an inspection made by one or the other, or both, at every location.

Q. One acted as inspector and the other as secretary, is that true?

A. That was the general rule. As the general rule, Mr. Bodner made the inspections and, as a general rule, Mr. Shattuck made the record. In some locations, how-
[fol. 3668] ever, Mr. Shattuck also made some inspections, and at each location they took soil samples.

. . . . . .

[fol. 3669] Mr. Littman: Will you please explain what you mean by the word "bond"? You said the bond was good.

The Witness: The attachment of the coating to the pipe
[fol. 3670] surface is referred to as the bond. If it adheres tightly, the bond is good. If this paint simply lays on the pipe without adhering, there is no bond.

In this location, there was definite surface rust with shallow attack on the metal about one pit per square foot but the depth of pits was not measurable.

. . . . . .

[fol. 3671] Mr. Littman: What did you term each of these two situations, Mr. Biddison? Didn't you term one shallow surface attack and the other you referred to that
[fol. 3672] as pits or pitting? I would like to be sure about it.

The Witness: On this particular observation, I have noted both, that there was definite surface rust and that there was shallow metal attack.

Mr. Littman: And inasmuch as there were no measurable pits, you did not use the classification of "pitting", did you?

. . . . . .

[fol. 3673] By Mr. Wheat:

Q. Now, Mr. Biddison, I don't want to ask you to read each one of these, of course, but I would like to have you go forward with your explanation of what you and the representatives of the Federal Power Commission's staff that you mentioned did on this joint inspection trip that you took?

A. I cannot tell you anything about what they recorded because I do not know what they recorded at any location.

Q I am not asking you that, Mr. Biddison, but what they did and what you did.

A As an example of a location where pitting was found, I will refer to test hole No. 5 on Line A1 [o] at Station 30 plus 00, this being in Moore County, Texas, in Section 1, Block B13, of the D. H. Railway Survey.

[fol. 3674] In this location, [was] was standard, we had six feet of the line uncovered, of which four feet was bared and two feet of paint showed.

My notation upon this location shows that the general topography was rolling, the immediate location was high. I made no notation as to drainage. The soil was red, sandy clay loam, vegetation was pasture. The earth was moist.

The coating was protected. There was no cracking or checking of the coating. Its physical condition was normal. It was very pliable, its bond was good. There was no indication of corrosion and there was shallow pitting at back and the pipe was pitted. I remember that the dimpgage put on one of the four feet of pipe which had been bared was 10 mils, that the dimpgage put upon the next one foot out of this four feet was 9 mils, that the dimpgage put upon [the] the next one foot of the four consecutive feet was 10 mils, that the dimpgage put out of the last foot of the four feet bottom was 9 mils and that is typical of the notations which I made with regard to pits. That is, where pits were found, the four feet nearest of bare pipe was divided off into one foot lengths and a determination made of what was the dimpgage put on each one [fol. 3675] of those four one foot sections.

Now, I know that the engineers of the Federal Power Commission recorded additional data as to distribution of pits around the circumference of the pipe and recorded in each one foot out what the dimpgage put additional pits, but as to what those records were on that, I have no knowledge, never having seen one of those records.

Q Well, you mean to say they never made available to you the records which they took on this joint inspection trip in the manner that One made available your record of what you took?

A That is right, and I did not ask them for it either.
Q At any rate, you have never seen it?
A That is correct.
Q They never offered to show it? A No, sir.

Mr Latiman He said he never asked for it.

Mr Wheat I did not ask that. I asked if they ever offered it to him.

Mr Latiman He said he did not ask for it.

Mr Wheat I asked if they ever offered it to him.

By Mr Wheat:

Q Now did the Commission representatives object to this type inquiry?

Mr Latiman I object to that.

Now if Mr Wheat is going to start varying out and half baked references I think he appears to be varying out of this thing. I would like to ask that a half be called so it is not much like asking a man when did you stop beating your wife?

[illegible] Now all of these negative inferences that are sought to be drawn from this thing are highly improper.

Mr Wheat I did not put anything but the facts.

Mr Latiman For instance, question as to whether the representatives of the Federal Power Commission ever objected to this and was told not to do that? We will never get through with this proceeding if we are going to indulge in those kind of inferences. They have no probative weight. What the Commissioner's representatives did not do would certainly have no reflection one way or another on what the witness did.

It seems to me that we are getting into a realm of wild speculation.

Mr Wheat Mr Examiner, had counsel for the Commission not sought to draw such inferences in his cross examination and had he not asked the witness questions with respect to those representatives of the Federal Power Commission who went with Mr Biddison on this joint

inspection, I should, of course, not be asking these questions.

I may say that I have here before me three certain questions which I have written down and which I propose to ask and in connection with this objection I should like to read these questions so that Mr. Littman may be [fol. 3677] informed precisely what I expect to ask.

I believe in connection with his cross-examination that I have a complete and unqualified right to ask these questions. They are as follows:

Did these Federal Power Commission representatives or either of them object to any of the inspection locations where you and they actually inspected this company's pipe line?

Did they or either of them express disapproval of any such location?

Did they or either of them request an opportunity to inspect the pipe in question at any location other than those where the test holes had been dug?

Were they or either of them refused any such opportunity?

Mr. Littman: As to the first two, of course those are highly irrelevant. What difference does it make? If Mr. Biddison wanted to run along the pipe line and fly a kite, that was all right with us. We did not care what he did do or did not do. Whether or not we objected to what Mr. Biddison was doing, would not have any relevance to this proceeding.

Now, if they want to draw inferences from the fact we went along with Mr. Biddison on these inspections and did not object to what he did and say that we, therefore, approved everything Mr. Biddison did, well, that is a new kind of sophistry.

[fol. 3678] Trial Examiner: The Trial Examiner is constrained to interpret these questions which Mr. Wheat has just read as containing no innuendo and will permit them to be asked.

Mr. Wheat: That is correct, there is no innuendo intended. We are merely trying to get at the facts of this inspection.

Trial Examiner: I am of the same mind as to the inquiry made by Commission counsel in cross-examination.

By Mr. Wheat:

Q. Now, Mr. Biddison, did these two Commission representatives or either of them object to any of the inspection locations [were] you and they actually inspected this company's pipe?

Mr. Littman: Object.

Trial Examiner: Overruled.

The Witness: They did not to me and I know of no other place where any objection was registered.

Mr. Littman: Note an exception.

By Mr. Wheat:

Q. Did they or either of them express disapproval of the selection of any such location?

Mr. Littman: Object. He said they did not express any approval either. We are wasting a lot of time here.

Mr. Wheat: Mr. Examiner, it seems to me this objection is futile in view of your ruling. I have already read these questions and you have ruled upon them.

[fol. 3679] Trial Examiner: He may answer.

Mr. Wheat: Why can't Mr. Littman's objections go to them all?

The Witness: They did not to me and I do not know of them having done so to anybody else.

Mr. Littman: Exception.

Trial Examiner: Note an exception.

By Mr. Wheat:

Q. Did they or either of them request an opportunity to inspect the pipe at any location other than where these test holes that you testified had been dug?

Mr. Littman: Object. He has answered that question at least five times to my knowledge.

Trial Examiner: Overruled.

The Witness: Not to me and I do not know of them having made a request to anybody else.

Mr. Littman: We certainly acknowledge and concede that no request was made.

By Mr. Wheat:

Q. And did these representatives of the Federal Power Commission who accompanied you upon this joint inspection trip or did either of them request that any additional test holes be dug at any point along the line?

Mr. Littman: Object.

The Witness: They made no such request of me and I do not know of such a request having been made to any- [fol. 3680] one else.

Mr. Littman: Exception.

• • • • • • • • •

[fol. 3684] Mr. Littman: I would like to have Mr. Biddison tell us the inspections at which Mr. McIlhattan was present? Was he present with you at all of the inspection points?

Mr. Wheat: Yes, tell us about that.

The Witness: It is possible he might have been absent at one or two, but I think [we] was present at every inspection.

Mr. Littman: You have not told us what he did. Would you mind if he would tell us what Mr. McIlhattan did?

Mr. Wheat: No, that is fine.

Mr. Littman: I thought you wanted to get a complete picture.

The Witness: He conducted me over the pipe line and mostly drove the car.

Mr. Littman: Did he make any inspections in the line?

[fol. 3685] The Witness: Not all of them; some of them he did. I have no record of how many he was in but he did inspect in some of the holes and some he did not.

Mr. Culton: The cathodic protection equipment is under his jurisdiction, is it not?

The Witness: Yes, sir.

Mr. Culton: So it was of importance to him to know what the condition of the pipe line was aside from any connection with the rate case?

The Witness: That is correct.

By Mr. Wheat:

. . . . . .

[fol. 3715] The Witness: I want to explain, with regard to this picture, that it is a flashlight picture, and not much of a picture.

Mr. Littman: Mr. Biddison, have you identified that picture as the one that was taken at the river crossing?

The Witness: Maybe I should have given it a little further identification.

Mr. Littman: Yes, and try to tie it in with the cross-examination.

The Witness: This picture is the one taken at night, and is the one about which Mr. Littman questioned me during my cross-examination.

Mr. Littman: Which river crossing was that?

The Witness: On the Missouri River crossing, east side [fol. 3716] on the new line, Line 200.

Mr. Littman: That is on the loop line?

The Witness: Yes.

. . . . . .

[fol. 3762] P. McDonald Biddison, a witness, having been previously sworn, resumed the stand and testified further as follows:

. . . . . .

[fol. 3780] Mr. Littman: Mr. Examiner, you will recall that during the course of redirect-examination of Mr. Bid-

[fol. 3781] dison, Mr. Biddison stated, in response to inquiry by counsel for Panhandle Eastern, that his estimate of going concern value was not necessarily reproduction cost.

Of course, the record will show exactly what he did say. It is my understanding that Mr. Biddison's position is that his estimate of going concern value is not reproduction cost.

Mr. Wheat: I think you will find, Mr. Littman, that he did not say what you say he said, but that he did say that cost of carrying unused capacity in this pipe line as determined factually by Mr. Morton and as those figures were finally used by him, Mr. Biddison, was not referable solely to reproduction costs.

Mr. Littman: And I believe he also testified to the same effect with respect to an amount of $552,992.48 which appears on Page 966 of Exhibit 39 entitled, "Total-Payments to Utility Companies."

Your Honor will recall that we have objected to Exhibit 39 in its entirety, and to Exhibit 62 in its entirety, on the ground that all of the figures shown therein represented this witness' estimate of reproduction cost new and reproduction cost new less depreciation.

As a matter of fact, in Exhibit 39, the heading, "Reproduction Cost New" appears throughout and, in Exhibit 62, particularly in the general summary on Page 2, Column B is headed, "Reproduction Cost—New", Column C is headed, "Deduct for Depreciation" and Column D is [fol. 3782] headed, "Present Value", and at the foot of that page, the title appears, "Total-Plant, Property, Business."

Now these items of going concern value appeared under those headings, both new and both as to present values, and I asked Mr. Biddison at one point in this record whether or not the term "Present value" was, in his opinion, synonymous with reproduction cost new less depreciation and he stated it was.

Well, at any rate, that was the basis of our objection to these going concern value figures was that they were re-

production costs. Since this witness has taken the position and has stated upon this record that his estimate of going concern value is not necessarily reproduction cost, we would like to, at this time, withdraw our objection, which objection was based upon the fact that it was reproduction cost, we would like to withdraw our objection to Page 966 of Exhibit 39, and we would like to withdraw our objection, which was made on the same basis, to corrected Page 965 of Exhibit 39-A.

Your Honor will recall that Page 965 originally appeared in Exhibit 39 but it was corrected and presented as Corrected Page 954 of Exhibit 39-A.

Now, the titles of those pages are as follows, the title of Page 966 of Exhibit 39 is "Panhandle Eastern Pipe Line Company and Subsidiary Companies Cost of Business Development."

[fol. 3783] The title of Corrected Page 965 of Exhibit 39-A is, "Panhandle Eastern Pipe Line Company and Subsidiary Companies Values of Gas Purchase Contracts."

We would like to withdraw our objection to those two pages which objection, as heretofore stated, was based upon the fact that we considered that the figures contained thereon represented reproduction cost, and we also wish to withdraw our objection made on the same ground to the testimony given by this witness in direct examination with respect to those two pages.

We would like to have it distinctly understood that we are reserving our right to object to this testimony and to these two pages and the estimates contained thereon on any other ground and, of course, if it should develop on cross-examination that these figures are, in truth and in fact, referable to reproduction cost, we, of course, reserve our right to renew our objection on that ground.

In short, Mr. Examiner, we wish to cross-examine this witness on this subject and we think perhaps the best way to handle it would be to have these two pages copied into the record at this point, so that reference may be made in cross-examination to the figures shown thereon.

Trial Examiner: Disregarding for the sake of correctness any technicalities, I construe your statement just made to be that you desire now to have read into the recorded Corrected Page 965 of excluded Exhibit 39-A as well as the original Page 966 of excluded Exhibit 39 [fol. 3784] and, if that is not permitted, you are, in effect, saying to counsel for Panhandle Eastern that you make no objection to their offering those pages which you have specified as exhibits.

Mr. Pittman: The latter is correct, except that we reserve our right, of course, to object for any further ground.

Trial Examiner: On some other ground, yes.

Mr. Wheat: We have already offered these pages, among others, and do not deem it incumbent upon us to reoffer them.

Of course, they are offered in this record, Mr. Examiner. They have been offered several times and we believe erroneously excluded, along with other pages which we believe were erroneously excluded.

Trial Examiner: There is no modification of the ruling heretofore made which includes, in toto, the exhibits referred to.

Mr. Wheat: May we have an exception to that ruling, too?

Trial Examiner: Certainly. If they are to be brought into the record, I assume that it might be by counsel for Panhandle and as to whether they might be brought in by counsel for the Commission, there might be discussion. At least, I should want the matter discussed if there is objection on the part of Panhandle Eastern counsel.

Mr. Wheat: I just want to say that the record is perfectly clear not only in the direct testimony of the witness as to the amounts in question but in his redirect testi- [fol. 3785] mony in connection with the nature of those figures. Counsel for the Commission having neglected to cross-examine him thereon, the record is perfectly clear as to the nature of the figures, and as to whether or not they are referable solely to reproduction cost, we deem it entirely incumbent on counsel for the Commission to make his election as to how he wishes to proceed in this matter.

We believe the record is clear.

Trial Examiner: You have no objection to his request that these pages be copied into the record at this point and that he cross-examine upon them?

Mr. Wheat: Not at all, your Honor. We have offered them for all purposes and they are in our offered exhibits.

Trial Examiner: Very well. The reporter will at this point copy into the record Page 966 from excluded Exhibit 39 and, following that, Corrected Page 965 from the correction sheets offered at Exhibit 39-A.

33	Total — Cost Of Business Development	$ 6 053 992 48

[fol. 3790] By Mr. Littman:

Q. Mr. Biddison, on Page 966 of Exhibit 39, which has been copied into the record, you show "Total Cost of

Business Development" in the amount of $6,053,992.48, do you not? A. Yes, sir.

Q. Is that your estimate of the cost of business development, so-called? A. Yes, sir.

Q. Now, that is made up of two items, is it not, namely, "Payments to Utility Companies" in the amount of $553,992.48 and "Carrying Costs on that portion of plant idle pending development of business" in the amount of $5,500,000.

A. That is correct. Those are two main subsidiaries. There is further subdivision of the item of "Payments to Utility Companies."

Q. Now, referring to payments to Utility Companies in the amount of $553,992.48, do you know how this amount has been charged on the books of Panhandle Eastern Pipe Line Company and its subsidiaries?

* * * * * * * *

[fol. 3791]. The Witness: In a general way I know that payments of this nature are included in the item, "Other Gas Sales and Purchase Contracts," which appears in an exhibit by Mr. Watkins beginning in the year 1931—

Trial Examiner: (Interposing) What is the exhibit number, Mr. Biddison, and the page?

Mr. Gorman: Exhibit 52, isn't it, Mr. Biddison?

The Witness: Yes. (Continuing)—and showing various amounts for each year subsequent thereto up to and including June 30, 1941.

I do not know whether each item on Page 966 of my Exhibit 39 has been charged against that account, but that account in general represents items of this nature.

Trial Examiner: Will you read that answer?

(Whereupon, the last answer, as recorded, was read by the reporter.)

Trial Examiner: You are referring now to Lines 43 and 44 of Page 2, Exhibit 52, are you not?

The Witness: Yes, sir.

By Mr. Littman:

Q. Do you know, Mr. Biddison, whether the amount of $365,334.99 which appears in Mr. Watkins' Exhibit 52, Page 2, Column M, Line 44, is included in the amount of $553,992.48 shown on Page 966 of Exhibit 39 in Line 30?

[fol. 3792] A. I do not actually know. I believe it to be.

Trial Examiner: You have no particular statement in your present position, Mr. Biddison, of the data included on Page 966, have you?

The Witness: No, that is all the data which I have on that matter.

By Mr. Littman:

Q. Where did you obtain the figures that are used to obtain the total of $553,992.48 which you call "Payments to Utility Companies"?

A. Not having my work papers over here on Exhibit 39, I am not able to give you a direct reference on that. I obtained that from an officer of the Panhandle Eastern Pipe Line Company and I think I have stated on the record just which one it was.

I do not now recall whether I obtained that information from Mr. Watkins or whether I obtained that from Mr. Paxton.

Q. At all events, you did not make an examination of the books and records of the Panhandle Eastern Pipe Line Company and subsidiary companies yourself, did you?

A. I made some examinations for specific purposes, but I did not myself take this from the books of the company.

Q. Now, you have referred to some specific purposes. Do those specific purposes embrace any of the items shown on Page 966 of Exhibit 39?

[fol. 3793] A. No, sir.

Q. Well, what did you ask this officer of Panhandle Eastern to give you?

A. I asked for a statement of these payments made to utility companies for the purpose of developing sales.

Q. You say, "to these utility companies." Did you give that officer a list of these companies, or did you just

ask him for a list of payments made to any and all companies?

A. I asked for a list of the payments made to utility companies for the purpose of developing business and I was furnished that information. This is the listing.

Q. Now, did you ask for anything other than that which you have just explained? A. No, I think not.

Q. Would your working papers show how these amounts, these items which go to make up the total $553,000-odd were charged on the books of the company?

A. No, sir, they would not.

Trial Examiner: For the convenience of counsel, it may be stated that the original testimony of Mr. Biddison with reference to Page 966 appears in the transcript at Page 555, continuing past Page 560. Do you wish to refer to that at this time, either counsel?

Mr. Littman: Yes. I have that before me.

By Mr. Littman:

[fol. 3794] Q. I take it from your answers to my previous questions that you have no personal knowledge of these items that go to make up the "Total Payments to Utility Companies" in the amount of $553,992.48?

A. That is right.

Q. Now, do I understand it to be your testimony that the amount which I have just named is the correct and proper amount to be included in a rate base for rate making purposes in this proceeding?

A. I think the items on Page 966 are proper to include in the rate base.

Q. How about the dollars on Page 966 that go to make up the total of the $553,000?

A. I think the amount is a proper one to include as a portion of the rate base.

Q. Can you tell us how you can arrive at such a conclusion without knowing anything, of your own personal knowledge, with respect to those figures?

A. I don't think that is very complicated. They represent costs. I didn't incur them. And the amounts have been stated based upon information which was derived from sources in which I have full and complete confidence.

* * * * * * *

[fol. 3795] Q. Now, you say they represent costs. Do you know that of your own personal knowledge?

A. No, but they were stated to me to be costs by the sources from which I secured the information, and I have full and complete confidence in that source.

Q. Suppose this source had handed you a figure of $1,000,000. Would you have included that amount in this exhibit as your estimate of one of the elements of the cost of business development?

A. If they had given me a statement that showed $1,000,000 with the details showing where the money went, I certainly would have used it, yes.

Q. Did you get any details as to where the money went as to these expenditures of $553,000?

A. I got the detail as shown on Page 966.

Q. Is that what you mean by "detail"?

A. That is exactly the detail to which I am referring and to which I testified.

Q. Suppose they handed you a figure of $50,000,000 with this detail, would you have testified on this stand in this proceeding that this represented your estimate of the amount to be included for "Cost of business development"?

A. I don't think I would have been silly enough to consider a $50,000,000 figure in this connection, no; but when somebody hands me a statement of costs incurred [fol. 3796] and states they do represent costs according to their records and they are from an officer of the company, I think I would use it.

Mr. Wheat: May I ask, Mr. Littman, are you questioning the validity of the amount shown as $500,000? If you are, we will be glad to furnish you any detail about it.

Mr. Littman: We are challenging every dollar that is shown on this Page 966. We do not feel that it is our duty to make a case on behalf of Panhandle Eastern Pipe Line Company and subsidiary companies.

* * * * * * *

[fol. 3798] Q. Let's look at some of these details, to use your terminology, Mr. Biddison.

Here is a rather fat item in Line 13 on Page 966 in the amount of $371,076 called "Payments on account Con-

tracts with Michigan Consolidated Gas Company, Detroit, agents, house heating."

Do you know when that amount was paid?

A. I know that payments were made on account of that contract over a period of years. I have read the contract between the Panhandle Eastern Pipe Line Company and the predecessor company of Michigan Consolidated Gas Company, in connection with the supplying of natural gas for Detroit by Panhandle Eastern Pipe Line Company.

I know that that contract provides for certain payments, some of these payments being based upon the number of house heating customers attached by the distribution company at Detroit.

I do not recall all the terms of it, but I have read those terms and know that such a provision exists in that contract.

Q. Now, will you answer my question, please, Mr. Biddison? A. I have done so.

Q. Will you give us the dates on which the payments were made, Mr. Biddison?

A. I will not, because I don't know them and have so stated.

[fol. 3799] Q. Do you know anything else about that item other than that which you have already stated?

A. That is the general information that I have in mind on that contract. There may be some additional details which I know about which I cannot now recall.

Q. You don't know how this amount was charged on the books of Panhandle Eastern Pipe Line Company, do you? A. I do not, and I have so stated previously.

Q. That answer goes for all the items that go to make up the $553,000? A. Yes, sir.

Q. Can you state the names of the companies and individuals to whom this amount of $371,076 was paid?

A. I cannot.

Q. Would it refresh your recollection if I were to state that approximately $100,000 of that was paid to a gentleman by the name of Parrish? Would that refresh your recollection at all?

A. No. I recall that there was a payment made by somebody to a man by that name, but whether it is in this account or not, I don't know.

Q. Do you know who Mr. Parrish is?

A. I know of a Mr. Parrish who at one time organized the pipe line system which is now Panhandle Eastern Pipe Line Company.

[fol. 3800] Q. If the fact should be that a portion of this amount of $553,992.48 had been charged on the books of the company as past operating expenses, would that make any difference in your so-called estimate of so-called "Cost of business development"?

A. No, it wouldn't make a bit of difference to me where they charge it. This is a statement of costs, and if it cost them that, it cost them that, regardless of how it was charged.

. . . . . .

[fol. 3801] Q. Mr. Biddison, did you ask for any further detail than that which you show on Page 966?

A. No, I asked for information as to what payments had been made for the purpose of developing business. I knew that payments had been made. I knew that certain contracts for the sale of gas called for payments to be made, and I asked for that information to be furnished to me.

It was furnished to me and I took from the information which was furnished, the data which I wished to use, and that is what is shown on Page 966.

On the original tabulation from which I took this I think there was some additional information as to some of the dates, but I didn't copy that whole information that was available.

Trial Examiner: Do you have those original sheets furnished you in your work papers to which you referred?

The Witness: No, sir, I do not. I have in my work papers, as I recall it, only the data which I copied off from the statement which was available, and I believe [fol. 3802] that corresponds precisely to what is shown on Page 966.

At the lunch hour, I will secure the work papers on which Page 966 is based and either confirm the statement that nothing else is shown, or produce anything additional which I have. Whatever I do have, I have with me at the hotel.

By Mr. Littman:

Q. I don't suppose you can tell us whether any part of this amount of $553,992 had been written off by the company in past years?

A. I think some parts of it had been. I so concluded from an examination of Exhibit No. 52.

Q. You are not prepared to state how much has been written off? A. No, sir, I am not.

Q. You are, however, of the opinion that $365,334.99 of this amount of $553,992.48 are "Payments to utility companies" yet remains in the book accounts of the company? That is your general impression, is it not?

A. It is, and I so concluded from an examination of Exhibit 52.

Q. Now, if that is the fact, and I think it might be the fact, would it be proper, Mr. Biddison, to add this amount of $365,334.99 to the present book cost of the company which already includes that $365,334.99?

[fol. 3803] A. No, I don't think it would be proper to throw in part of it and throw it all in again, certainly not.

Q. In other words, your Exhibit 69—I wish you would please turn to it—Page 2, Line 15, shows that that amount, to-wit $365,334.99, is included on the books of the company as "Other gas sales and purchase contracts."

A. Yes, sir.

Q. Now, I believe you have testified that your going concern value of which "Payments to utility companies" forms a part, was not solely referable to reproduction costs. Is that correct?

A. Well, I have not said a word about "going concern value" in this case. I have not used that term.

Q. Well, your lawyer has. You don't think this is a part of going concern value?

A. I have not called it going concern value and I have strictly avoided the use of the term because I don't understand what anybody else means when they use it, and

I don't think anybody else would understand what I mean if I were to use it, so I have not used the term.

Q. You used the term "cost of business development."

A. Yes, sir, I did.

Q. And this item of $553,000, of course, forms an integral part of that cost of business development?

A. That is correct.

[fol. 3804] Q. Now, no matter what you call it, if this Commission were to use book costs, for example, as a rate base, it would be improper, would it not, to include that $365,344.99 twice? A. Why, certainly.

Q. So that this amount of $553,992.48 of "Payments to utility companies" is, strictly speaking, referable to your reproduction cost, is it not, Mr. Biddison?

A. No, sir, it is not. It is referable to the determination of the rate base, no matter how it is determined.

Q. But it should go in once?

A. Once in each rate base only, that is absolutely correct.

Q. So that if book cost or original cost were used and the capitalized amount of $365,334.99 were included in such rate base, there would be no necessity of including that part of your "Cost of business development" in the same amount again?

A. In the same amount is correct. I think the difference should be added.

Mr. Culton: Have you heretofore prepared an exhibit on that basis?

The Witness: I have.

Mr. Littman: On what basis?

Mr. Culton: If book cost were the remaining factor.

By Mr. Littman:

Q. Now, the difference—you don't know what the dif-[fol. 3805] ference represents, do you, or how it was charged on the books of the company?

A. I don't know how it was charged on the books of the company, but you can readily ascertain the difference by a little subtraction of one from the other, or in the determination of the rate base you can deduct this amount of "Other gas sales and purchase contracts" in the amount of $365,334.99, and in lieu thereof, add the cost $553,992.48.

. . . . . .

Mr. Culton: I will state, at a later date we shall present an exhibit prepared by Mr. Biddison, showing what the rate base would be on the assumption that book cost is appropriate, in which he had indicated the sum shown on the books as the item for "gas sales and purchase contracts" and from the plant account and he then added [fol. 3806] an aggregate covering the cost of business development and the value of gas purchase contracts.

Trial Examiner: That procedure, however, does not eliminate the $553,992.48 which has been under discussion?

Mr. Culton: It does not. It does eliminate the $365,000 and includes the $500,000.

Trial Examiner: In other words, it simply avoids the duplication which apparently has been developed?

Mr. Culton: It does.

Mr. Littman: All of which, if I may remark on the record at this time, verifies my original objection to this so-called going concern value as being referable to their claimed reproduction cost. Let's get on [the] the next item.

By Mr. Littman:

Q. Mr. Biddison, the next item is in the amount of $5,500,000 as shown on Page 966 of Exhibit 39 in Line 32, entitled, "Carrying costs on that portion of plant idle pending development of business."

. . . . . .

And you obtained or derived the figure of five and a half million from a consideration of Mr. Morton's Exhibit 38, did you not? A. That is correct.

[fol. 3807] Q. Did you advise Mr. Morton how to prepare Exhibit 38?

A. I told Mr. Morton what I desired to develop and discussed with him methods by which it could be developed.

Q. Did you give him the five methods that he used which are shown on Page 2 of Mr. Morton's Exhibit 38?

A. I don't know whether these methods originated all with Mr. Morton or with me, or partly with Mr. Morton and partly with me.

We discussed various methods of developing this cost of carrying capacity while load developed, and in final analysis, after discussing the various methods, I was satisfied to develop the five methods which we used and so advised him.

Q. Before you requested Mr. Morton to work up his Exhibit 38, did you have any preconceived notion as to what the result would be? A. Not the slightest.

Q. If Mr. Morton's studies had shown the amount of interest, ad valorem taxes and operating expenses allegedly attributable to unused capacity to have been about $2,000,000 instead of about five and a half million to six and a half million, how would that have affected your estimate? A. By just about that amount of money.

Q. In other words, your opinion has its roots and foundation in Exhibit 38?. A. That is right.

[fol. 3808] Q. Now, which of the five methods of calculating interest, ad valorem taxes and operating expenses attributable to unused capacity, found by Mr. Morton, do you consider the best and most accurate?

A. I have no choice between them. As a matter of prediction one might make a choice, but for the estimate of something which did happen I think the matter should be tested by such logical methods as may be obtainable and, in the final analysis I have not selected any particular one of these methods as being my choice based upon the fact that they produce results not widely disproportionate, and I have adopted a figure which is not the high one, not the low one, not the intermediate one, and not the average.

Q. How did you arrive at the [$5,500,00] figure from these different amounts which range from a low of $5,115,567 to a high of $6,680,062?

A. As a matter of judgment considering those high and low figures and the intermediate figures.

Q. You didn't add them up and divide by five, did you?

A. No, sir, I did not. I may have done that, but I didn't secure my answer in that fashion.

Q. How did you know that you should take $5,500,000 rather than, let us say, $5,250,000?

A. That is my judgment, that about $5,500,000 is a logical conclusion of what that cost actually was, based upon these studies.

. . . . . .

[fol. 3809] Q. Can you give us the mental process by which you derived $5,500,000 from these figures which are in some instances about $1,000,000 apart? I am curious as to how you did that.

A. In consideration of these figures which have been developed here, it is my estimate that $5,500,000 is a fair estimate of the cost of carrying that capacity.

Q. Is there any doubt in your mind, Mr. Biddison, if you had ten engineers look at these five different figures varying more than $1,000,000 in some instances, you would get ten different figures from that?

A. I suppose probably you would, but they would not be very far apart.

Q. All right. Are you familiar with the figures in Exhibit 38?

A. Well, I have examined the details going through there, but I am not familiar with the detail figures.

I have examined them at one time. The details were developed by Mr. Morton and he is the man who would have to explain the details, not me.

[fol. 3810] Q. Well, let's be a little more specific. This exhibit is predicated upon past interest, past ad valorem taxes and past operating expenses which Mr. Morton and you have concluded are attributable to unused capacity. Is that right? A. That is correct.

Q. Do you express an opinion that these amounts shown by Mr. Morton are in truth or in fact attributable to unused capacity, based upon your own personal knowledge?

A. Not based upon my personal knowledge, because I have no personal knowledge of what the operating costs were at that time.

I have not investigated what they were at that time.

Mr. Morton did make the investigation and he made the compilation.

Mr. Lee: May I ask a question now?

Mr. Littman: Certainly, Mr. Lee.

Mr. Lee: Did you make any effort to ascertain the history of the company during that period for the purpose of determining whether or not the failure to achieve the full use of capacity may have been due to the policies and the conduct of the company itself rather than the lack of markets?

The Witness: I made no investigation as to what methods the company had pursued during that period to attach business. I know that in any natural gas project there is a period of development during which there can be no expectancy of fair return upon the money invested.

[fol. 3811] A company of that nature is fortunate if in the first year their revenues are sufficient to pay their out-of-pocket expenditures. They are again fortunate if, in the second year, their revenues are enough that they can begin to set aside something to the depreciation reserve.

And, they are again fortunate if, at the end of the five-year period, they have developed load enough on a projected system that they may have some net earnings.

No system can be installed with a small pipe at a low investment and then expanded in diameter to meet the growing load.

It is inherent in the business that initial investments must be made to provide capacity far in excess of that initially required, and it is typical of the business that such a system once built requires in the neighborhood of five years to develop its load.

. . . . . .

[fol. 3813] Mr. Lee: If I understand now, his answer is that he made no investigation of the history of the company during that period,—if I understand correctly, then I am satisfied. Is that your position?

The Witness: No, I have some knowledge of the history of the company during that period. I did not make

that investigation in connection with the compilation of this report.

Mr. Lee: Did you consider it in connection with the compilation of the report?

The Witness: Yes.

Mr. Lee: What weight did you give to it?

The Witness: I gave it this weight: I felt that the development of this project up to the capacity attained in the basic year, was substantially a normal development [fol. 3814] of that kind of a project.

. . . . . .

[fol. 3816] The Witness: I predicate the use of this data upon the conclusion that no matter what had been the squabbles during the interim, that the development had followed a normal pattern of development. That is the beginning and the end of the consideration I gave to all those matters.

. . . . . .

[fol. 3818] P. McDonald Biddison, the witness testifying at the time of the noon recess, resumed the stand and testified further as follows:

Recross Examination (Continued)

By Mr. Littman:

Q. Mr. Biddison, at the close of the morning session, we were discussing Mr. Morton's Exhibit No. 38 and the conclusions which you drew from that exhibit.

I refer you to Exhibit 38, Page 1, Line 21, entitled, "Operating Expense—Partial" and ask you whether you can state the types and character of expenses that are included within the meaning of that term in the figures shown in Columns A, B, C, D and E?

A. No, I cannot give you a breakdown on those figures. They have been explained by the man who compiled them, Mr. Morton.

Q. And you are not able to state from your own knowledge what operating expenses are included in those columns?

A. No, because I did not do the job. Mr. Morton did the job.

Q. Did you tell Mr. Morton what types and kinds of expenses to include?

[fol. 3819] A. I told him to include those items that did not vary with the amount of gas sold and to exclude compressor station operation and exclude the production expenses. Now, beyond that, the job is Mr. Morton's.

Q. Did you have anything to do with the deductions from those amounts of operating expenses which are shown in Lines 23 and 24 and which are included, in part, in the figures shown on that line?

A. I had nothing to do with any of the figures on this page or the next one. The work was done by Mr. Morton.

Q. I take it by your answer that you are not familiar with the details of the figures which I just referred to?

A. That is correct. I reviewed the work during the course of its preparation, but I did not do the work and I am not thoroughly familiar with all of the details.

Q. Is the same true with respect to the interest charges which appear in Line 19 of Exhibit 38?

A. As I said before, it is true of every figure on this page and upon the next page.

Q. Now, Mr. Wheat asked you a question at Page 560 of the transcript—I will have to get a copy of it.

Trial Examiner: I have it right here, Mr. Littman.

(A document was handed Mr. Littman.)

By Mr. Littman:

Q. The question is as follows; and I might say that he was referring to the $5,500,000 figure which you used [fol. 3820] and which you called "carrying costs on that portion of plant idle pending development of business."

"Question: And they represent real costs and actual money expended on the history of this plant rather than mere past losses?

"Answer: That is correct and they represent value because they are costs which would be incurred in the reproduction of this property and they are costs which would be escaped by a purchaser who purchased the property with this business which has been attached by the expenditure of that money."

Did you make that answer to that question, Mr. Biddison?

A. I did.

Q. Now, when you made that answer to Mr. Wheat's question, you did not know of your own personal knowledge that these amounts represented costs, did you?

A. I know in this way, that I had a compilation made for me by an employee of Panhandle Eastern Pipe Line Company whose duty it was to determine what those costs had been and, on that basis, I referred to them as costs and believe them to be costs.

Q. Your knowledge is, of course, hearsay, is it not, with respect to these costs, so-called?

A. No, sir, it is not hearsay. It is a result of an investigation performed by an employee of Panhandle Eastern Pipe Line Company at my direction and reported to me by him.

[fol. 3821] Q. Do you know what he did? Do you know what he did?

A. I have the results of what he did before me.

Q. Do you know what he did?

A. Yes, he compiled Exhibit No. 38.

Q. Did he examine the vouchers and make an audit of these so-called costs?

A. I do not know exactly how much detail he went into.

Q. You do not know what he did at all except as it is reflected by Exhibit 38, do you?

A. I know what he did as reflected by Exhibit No. 38 and the working papers which support it.

Q. And further than that, you do not know, do you?

A. That is correct.

Q. Is the sum of $5,500,000 the amount which you estimate would be incurred in the reproduction of the property and the business of Panhandle Eastern?

A. I estimate that that sum would be incurred in the reproduction of that property, yes, sir. Further than that, I believe it to be a fair estimate of the amount which was incurred in the development of the business.

Q. And when you use the term "cost", you are not referring to capital cost but you are referring to past operating expenses, past interest and past ad valorem taxes, are you not?

A. I am referring to costs of that nature, no matter how they were classified in accounting practice.

[fol. 3822] Q. Well, I want to make certain we understand what you mean when you use the word "cost", Mr. Biddison. It may not make much difference to you, but it may make some difference to others and I want to be sure we understand each other.

Mr. Culton: We think the answer is plain, Mr. Examiner, without that lecture.

By Mr. Littman:

Q. The term "Cost" as you have used it here in connection with Exhibit 38 refers to past operating expenses, past ad valorem taxes and past interest, does it not?

A. It includes some of those items, yes, sir, as costs. I have not included, and Mr. Morton did not include, any allowance whatever for one item which could be construed to be cost, and that would be the item of depreciation which occurred upon this property during this period.

At my direction, this estimate was limited to those costs which required the expenditure of moneys.

Q. Now, when you use the term "cost" here, you are not referring to amounts which have been capitalized by the company on its books, are you, Mr. Biddison?

A. No, sir, I have stated before I refer to what the costs were no matter whether capitalized or not capitalized and no matter how they were classified in accounting practice.

Q. In other words, you were not referring to the term "cost" as is defined in the Uniform System of Accounts prescribed for natural gas companies by the Federal Pow-

[fol. 3823] er Commission, were you?

A. Well, it may be cost as defined some places in there and it may not be as defined in other places.

Q. Would you mind answering my question, Mr. Biddison? What is the fact, if you know?

A. I have answered it to the best of my ability.

Q. I take it from your answers that you are using the term "cost" in the broad sense and not in the accounting sense. Perhaps that is the difficulty that I am having.

In other words, if I can convey to you what I have in mind, in a sense every expenditure is a cost in the broad sense, is it not?

A. Yes, sir.

Q. And you are using the word "cost" as including out-of-pocket expenditures, is that correct?

A. That is correct. I have tried to say that several times.

Q. Well, you cannot make it too clear on the record for me, Mr. Biddison, even though it may seem to you a little repetitious.

Now, will you please turn to Page 965 of Exhibit 39-A, I believe you have testified that the value of gas purchase contracts is $1,585,914, have you not?

A. Yes, sir.

[fol. 3824] Q. And you arrived at that conclusion from the figures and computations shown on Page 965 of Exhibit 39-A, have you not? A. Yes, sir.

Q. Does any part of the amount of $1,585,914 represent actual cost or investment?

A. No, sir. There may have been some costs in connection with these contracts but the figures on Page 965 of Exhibit 39-A do not represent costs. They represent an estimate of value.

Q. Now, Mr. Biddison, is this figure of $1,585,914 referable solely to reproduction cost?

A. No. It is simply an estimate of the value which I ascribe to the fact that Panhandle Eastern Pipe Line Company has those contracts in existence.

Q. Now, if book cost or original cost were used as the rate base in this proceeding, in your opinion, would it be proper to add the sum of $1,585,914 to such rate base?

A. I think it would be proper to include this value in the rate base no matter how determined. Now, the wording of your question was a little bit confusing to me. I do not see how you can take book cost as the rate base and still talk about including something else in the rate base. I can conceive how you could take book cost as a portion of the rate base and include therewith other items that are proper to be included.

[fol. 3825] Q. Perhaps we might be a little more specific and make certain that we understand each other.

Please turn to Page 2 of Exhibit 69, which exhibit shows, in Column C, the purported book cost of Panhandle Eastern Pipe Line Company and subsidiary companies.

Now, in Lines 12 and 13, you show an amount in Column C and Column E, $1,318,629.10 for "gas sales and purchase contracts (less $1,611,657.30 reserves)", do you not?

A. Yes, sir.

Q. Now, the point I am driving at, Mr. Biddison, is if that figure of $1,318,629.10 were included in a rate base as the book cost of gas sales and purchase contracts, obviously the amount of $1,585,914, which you estimate to be the value of gas purchase contracts should not be added thereto, should it? A. Obviously.

Q. So that, obviously, this amount that you show on Page 965 of Exhibit 39-A in the amount of $1,585,914 is not referable to book cost or original cost, is it?

A. No, and I have never intimated that it was.

Q. But it is referable to reproduction cost, is that correct?

A. It is referable to a rate base no matter how determined, whether through reproduction cost, book cost or just reaching out in the air for a figure. It is still referable to a rate base.

[fol. 3826] Q. Well, we are agreed, are we, that the two that I read to you should not be included in one rate base at any rate, are we not? A. Certainly.

Q. Now, is my understanding correct that in Column B, that is, the Column B that appears at the top of corrected Page 965, Exhibit 39-A, you show the present purchase price paid by Panhandle Eastern Pipe Line Company to the companies shown in Column A for gas purchased from those companies? A. Yes, sir.

Q. Now, let's look at Line 1, J. M. Huber Corporation. The price, according to this exhibit, is 3½ cents per M. c. f., is it not? A. Yes, sir.

Q. Can you advise us whether that is a flat price or an average price or what kind of a price it is?

A. The price is 3½ cents for the first ten years and thereafter, at five-year periods, adjustments are to be made to the weighted average price paid by pipe line

companies piping gas out of South Hutchinson County and North Carson County.

Q. When was that contract entered into?

A. The date on that contract is September 21, 1935.

Q. Then there remains only about four years of the first ten-year term, does there not?

[fol. 3827] A. That is right.

Q. Does that ten-year term run from the date of the contract or the date of the first delivery, do you know?

A. I do not know on that point.

Q. Now, you have included the purchases from J. M. Huber Corporation for how far into the future?

A. For 11 years.

Q. Will you explain how you arrived at the 3½ cent price for the entire term of 11 years?

A. I simply used the 3½ cent price without correction therefor.

Q. Mr. Biddison, my recollection of your answer with respect to how that price was to be determined for the latter period has escaped me. Would you mind repeating that part for me?

A. After ten years, the adjustments are to be made to the weighted average price paid by pipe line companies piping gas out of South Hutchinson County and North Carson County.

Q. Mr. Biddison, it is altogether probable, is it not, that four years hence, when those adjustments are to come into play, the price of 3½ cents may change, may it not? A. Yes, sir.

Q. You took the 3½ cent price and applied it to what volume of gas, Mr. Biddison?

A. The application of price is made to the volume esti-

[fol. 3828] mated to be purchased under these contracts by Mr. Hinton and—

Q. (Interposing) Had you finished your answer, Mr. Biddison?

A. I am trying to find some more detail on this matter which I am having a little trouble locating.

Q. Very well. Perhaps you can read into the record the precise amounts of purchases for each of the years applicable to the J. M. Huber Corporation; if so, I would greatly appreciate it.

A. That is what I was looking for. There is a working sheet of mine that gives that detail. It is not in position where it belongs here.

* * * * * * * *

[fol. 3829] By Mr. Littman:

Q. Have you been able to find the work sheet showing the amount of purchases to be made or the amount of purchases of gas to be purchased by Panhandle Eastern Pipe Line Company from J. M. Huber Corporation?

A. No, sir, I have not. It does not appear to be in the working papers which I have with me.

In this tabulation, I call attention to the fact that on Exhibit 39-A, Page 965, at the close of the year 1945, as indicated at Line 18, there is a material reduction in the amount of purchases under these contracts.

Q. You mean under all of the contracts? A. Yes, sir.

Mr. Culton: What is the reduction?

The Witness: The reduction amounts to about 5,226,000 M. c. f. per year. Now, it is my recollection that that is the point at which I dropped the purchases from the J. M. Huber Corporation in compiling that table. I will, however, check that matter and furnish a breakdown of the quantities in Column B.

By Mr. Littman:

[fol. 3830] Q. Very well. You will submit such a statement for the purchases under each of the contracts shown on Page 965 of Exhibit 39, will you not?

A. Yes, sir. It is my recollection that I dropped this contract at that time and I should have done so, and I believe I did. I will submit the detail in order to show completely what I did in that connection.

Q. And in connection with the rest of the contracts?

A. Yes, sir.

Q. Very well.

Now, the second contract that you have listed is that of the King Oil Company and you show that the price paid by Panhandle Eastern for gas purchased from that company is 2½ cents. Can you state the date of that contract, please?

A. I do not have the date on that contract. I have a memorandum as to the term.

Q. Will you give us the information that you have with respect to that contract?

A. The term is for as long as gas is produced in paying quantities.

Q. Is the price a flat price?

A. Yes, sir.

Q. Of 2½ cents for each and every M. c. f. produced?

A. Yes, sir.

Q. And can you state whether the purchases from the [fol.3831] King Oil Company are included in each of the years shown on Page 965 of Exhibit 39-A down to and including 1951?

A. Yes, sir, they are.

Q. Will you give us the same information with respect to the third contract, namely, Navajo Production Company?

A. The contract is to be effective so long as it is profitable to the purchaser.

Q. Now, is that contract price a flat rate or is it an average, or what?

A. It is a flat rate, 3½ cents.

Q. Per M. c. f.?

A. Yes, sir.

Q. Now, what are the facts with respect to the next contract, Northern Natural Gas Company?

A. It is for a term of eight years. The contract was made September 27, 1935, and, therefore, runs to 1943.

Q. Have you then included any purchases after 1943 in your tabulation on Page 965?

A. No, sir.

Q. That leaves the fifth contract, namely, that of Shamrock Oil and Gas Company. Will you give us the same data with respect to that?

A. The price is 3½ cents, but at the expiration of the present contract for the supply to Detroit, if the price at Detroit is increased or decreased, the price of that gas shall be increased or decreased in the same percentage.

[fol.3832] Mr. Lee—I take it you assumed a decrease on Detroit for that?

The Witness: I did not. The provision is effective as at the end of the existing Detroit contract and I had no reason to make any assumption in that regard.

. . . . . .

By Mr. Littman:

Q. When does the Detroit contract expire, if you know?

A. About 15 years from sometime in 1936, I think is the fixed term of it but I do not know whether there be a definite or absolute termination date on it or not.

Q. Well, do the purchases shown in Column B include purchases from Shamrock Oil and Gas Company through each of the years shown, including 1951?

A. Yes, sir.

Q. Is my understanding correct, Mr. Biddison, that the theory of this exhibit is that Panhandle Eastern Pipe Line Company has certain contracts under which it purchases gas at a price below 4½ cents per M. c. f.?

A. That is correct.

Q. And that in view of the fact that it has these advantageous contracts, there attaches thereto a certain [fol. 3833] value and you have computed the value?

A. That is correct.

Q. Now, the 4½ cents per M. c. f. which you showed in Column D, on corrected Page 965, Exhibit 39-A, represents what?

A. It represents the general field price for high pressure sweet gas at the wells.

Q. Where?

A. In the Panhandle Field of Texas.

Q. How did you arrive at that market value or present value of gas at the well head in the Panhandle Field?

A. From a general consideration of prices on gas of recent determination rather than from the old contracts made in the early days of the field.

Q. In other words, you determined that figure?

A. Yes.

Q. Without assistance from others?

A. I think I had assistance from others, yes, I had information from others on it.

Q. But it resulted from your own personal investigation of the market price, did it?

A. It is my determination.

Q. How many contracts did you consider in arriving at that market value?

A. I do not know. I have not made any recording of all the information which I used in that connection. I have [fol. 3834] participated recently in some negotiations in regard to piping of gas out of the Panhandle Field and, in that connection, gained some information as to the value of gas at the well head in the Panhandle Field.

Q. Can you be a little more specific about that? Can you give us an approximate number of contracts that you considered?

A. No; and I gave consideration to the fact that payments for royalties in the Panhandle Field are being continuously based upon higher and higher gas values whereas, at one time, those royalties were based upon a 2-cent well price.

They have been quite generally stepped up by the consent of the producing gas companies to higher and higher figures.

Q. Well, can you give us the names of some vendors whose sales you used as the basis of this so-called 4½ cent market price?

A. I gave consideration more to the basis on which royalties are now being paid than I did to any recently negotiated sales contracts.

In that connection, it is my recollection that royalty payments by Texoma Natural Gas Company are now on a 4½ cent basis and have been for some little time.

Q. Are you sure about that, Mr. Biddison?

A. That is my recollection of it.

Q. Can you name any other vendees or vendors, any [fol. 3835] other contracts or arrangements on which you can say that you based this 4½ cent field price?

A. I think I could, Mr. Littman, if I had a little time to refresh myself on this. Being called for cross-examination on something which had been ruled out and without the opportunity to refresh myself has handicapped me some.

I believe that Panhandle Eastern itself is now paying royalty in that field on a 4½ cent basis. That is my recollection of their base.

Q. Well, do I understand that you predicated this market price primarily upon a consideration of royalties paid?

A. Primarily because I do not know of recent contracts in any great quantity for purchase in that field.

Q. Will you please explain how royalties are determined in the field?

A. The royalty provision is generally one of one-eighth of the product.

Q. Of what price, Mr. Biddison?

A. One-eighth of the product and, in making that compensation, the compensation is generally made in cash at what is construed to be the value per unit of the amount of royalty gas or oil produced.

Now, in the case of natural gas in the early days in the Panhandle Field, those royalties were, in a great many cases, based upon a 2-cent well head price and as conserva- [fol. 3836] tion measures because effective, as the takes of gas became more equitably distributed among land owners and as an encouragement to prevent riotous over-drilling; the base for the payment of royalty was gradually stepped up and as markets increased, realizing that marketable gas had a higher value than gas which could not be disposed of, the general basis for the payment of royalties in the Panhandle Field has gradually increased until today I think that in the western Panhandle Field, 4½ cents at the well head for high-pressure sweet natural gas is a fair measure of its present well head value.

. . . . . .

By Mr. Littman:

Q. I believe we were discussing, just before the recess, the matter of how you established the so-called market price of 4½ cents per M. c. f. You are not engaged in the business of buying and selling gas in the Panhandle Field, are you, Mr. Biddison? A. No, sir.

Q. You have never been so engaged, have you?

A. No, sir.

Q. Do you know what royalties are being paid by the five vendors shown on Page 965 of Exhibit 39-A to their [fol. 3837] lessors? A. No, I do not.

Q. Did you make detailed investigation of the royalties paid in the Texas Panhandle Field? A. I did not.

Q. Now, referring to Column B of Page 965, Exhibit 39-A, headed, "Purchases M. c. f.", will you briefly explain how you made the determination of those figures?

A. Those are the estimates made by Mr. Charles Hinton, production engineer of Panhandle Eastern Pipe Line Company, as to the amounts of such purchases for the respective periods.

Q. Do you know whether those amounts of purchases are predicated upon Mr. Morton's estimated future gas sales?

A. I do not know exactly how Mr. Hinton made those determinations. I secured this data from his working papers and it is his estimate of those sales, that is, sales by these companies, and purchases by Panhandle Eastern Pipe Line Company.

Q. I presume if there are any questions we would like to have answered with respect to those purchases shown in Column B, we should ask Mr. Hinton when he comes here for cross-examination? A. That is correct.

Q. I believe you alluded, Mr. Biddison, to the fact that the market price of gas in the Panhandle Field of Texas has been going up in recent years. Will you please briefly state the reason for that?

[fol. 3838] I believe you started to state some of the reasons. You mentioned, for instance, the fact that conservation laws had been passed and put in effect in the State of Texas, and, secondly, as I recall, the building of pipe lines such as Panhandle Eastern Pipe Line Company has built has created a market for gas.

Now, those things all have an effect, do they not, upon the market price at the well head, of gas in the Texas Panhandle Field? A. Yes.

Q. Isn't that a market that the gas consumer himself has created to a large extent?

A. No, I don't think the gas consumer has ever created any market any place. Somebody else created the market by getting some gas consumers attached.

Q. You don't think, then, that the use made by the burner tip users of gas in Detroit, for example, is having any effect upon the market price of this gas?

A. Certainly it is.

Q. Of course, it is. It is what kind of an effect?

A. It has the effect that as such use increases, the market for gas increases.

Q. And as the market for gas increases, the so-called market value of gas increases, does it not?

A. That is a general rule. There are exceptions?

[fol. 3839] Q. And as the market value increases, then the wider the spread between the contract price of gas paid by Panhandle Eastern to these five vendors and the so-called market price. Is that correct?

A. That is correct, yes.

Q. And then it follows, does it not, the higher the purported "value of gas purchase contracts."

A. I believe that follows, axiomatically.

Q. Now, we have a final figure of $1,585,914 shown at the foot of Page 965 of Exhibit 39-A. Doesn't this amount, in reality, represent the savings anticipated by the company by reason of its having contracts for the purchase of gas at a lower price than the claimed present market value of that gas?

A. It represents the present value of the future savings to be effected by purchasing gas under these contracts, over buying that gas at 4½ cents. It doesn't represent all the savings.

Q. I presume you are now referring to the 7 percent discount interest rate that you use and apply in Column F?

A. That is right.

Q. That is correct? A. That is right.

Q. The "difference" as shown in Column E represents the actual total savings, does it not? A. Yes, sir.

[fol. 3840] Q. And the amount of $1,585,914 represents the so-called present value of that savings based on a 7 percent interest calculation. Is that correct?

A. That is correct.

Q. Now, doesn't your estimate depend upon the market value of gas remaining constant at 4½ cents throughout the next 11 years?

A. No, sir, it does not. It is dependent upon 4½ cents being its present market value. If that market value were to increase in the future there would be some additional savings in that respect. I think that price will increase in the future, but I have given it no effect in the determination of present values.

Q. Well, the exhibit is predicated upon your assumption, is it not, that the price will remain—that is, that the market price will remain at 4½ cents for ten or eleven years in the future. Isn't that true?

A. No, it is not, because I have not made any such assumption. I have used 4½ cents as the present value and I have applied that as the future value because it is the present value, always having in mind the expectation that those values would increase; but, I have not, in this compilation, given any effect whatever to that expectation.

I have used 4½ cents as my estimate of the minimum price and future value, not that it will remain constant.

[fol. 3841] Q. Well, perhaps we can get at it this way. Assuming that the market price of gas at the well head in the Texas Panhandle Field were to drop to 3½ cents tomorrow and stay at that price throughout the next eleven years, what would your value be?

A. It would be somewhat less and, conversely, if that price were to rise, my value would be somewhat more.

Q. Well, if it was 3½ cents it would be quite a bit less, wouldn't it?

A. Yes, and if it was 5½ cents; it would be quite a bit more.

Q. Now, of course, that is what I was referring to when I said that the calculation you have made here is primarily based upon an assumed price of 4½ cents per M.c.f. for gas at the well head for the next ten or eleven years.

A. No, it is not that. It is based upon the assumption that 4½ cents is the present price and the minimum in the future.

I make no assumption that it will remain constant. I make the assumption it will not decline, and I do not capitalize any excess savings over and above the 4½ cent figure.

Q. Mr. Biddison, I am sorry that we have to quarrel about that, because I was certain that I understood this exhibit, and now I am not so sure about it.

Now, let's look at Column D. You are using a figure of [fol. 3842] 4½ cents. That means 4½ cents per M.c.f. Do we agree on that?

A. Yes, sir, it does, and I have used it for each year in Column—

Q. (Interposing) You use it for 1941, do you not?

A. Yes, and in 1942, and in 1943, and in 1944, and in 1945, and in 1946, and in 1947, and in 1948, and in 1949, and in 1950, and in 1951.

Q. And in each of those years you multiply the 4½ cents by the number of M.c.f.'s purchased for each of those years, do you not?

A. Yes, sir.

Q. And you, in that manner, obtain the values shown in dollars in Column D, do you not?

A. That is correct.

Q. Well, that was my understanding.

And you say that does not mean that you are using a 4½ cent per M.c.f. for each of those years?

A. No, I did not say that, Mr. Littman. I said that I did not assume that 4½ cents would be the field price for gas throughout all that time.

I thought I had made it plain that I used 4½ cents during that time as being the minimum, that I disregarded the expectation that there would be any increases.

I did not think there would be any decrease.

[fol. 3843] Such savings as would result from an increase over the 4½ cent price in the future, I have ignored in the determination of present value.

Q. And you have ignored any decrease in the market price of gas, if any should perchance result, have you not?

A. That is correct, because I do not think there will be any. I think the tendency will be in the other direction, but I have given no effect to the tendency which I expect.

Q. In other words, you used the 4½ cents throughout the 11 years? A. Again, I did.

Q. That is what I understood you did. Do you know what the market price at the well head is for gas in the Hugoton Field?

A. I think there is some considerable variation in that. I don't have anything before me now relating to that matter.

Q. Have you finished your answer? A. Yes.

. . . . . .

By Mr. Littman:

Q. Did you make an examination or an investigation of the contracts of the Panhandle Eastern Pipe Line Company for the purchase of gas in the Hugoton Field, such [fol. 3844] as that which you have presented here with respect to the Panhandle Field in Texas?

A. No, except to a very limited extent, and that indicated that there were no purchase contracts under which there would be any material saving for any material length of time.

Q. Do you know, Mr. Biddison, whether Panhandle Eastern Pipe Line Company has gas purchase contracts in the Hugoton Field that are in excess of 4½ cents per M.c.f.?

A. No, I don't. I don't remember the scales on those. I have had occasion to examine some of them at some times and, in this connection, I did go into the matter far enough to know that there was no great amount of difference on the whole or for any great period of time, between the contract price and the general field price.

. . . . . .

[fol. 3846] By Mr. Littman:

Q. Now, Mr. Biddison, I call your attention to the annual report of Panhandle Eastern Pipe Line Company filed with the Federal Power Commission for the year 1940, and I call your attention to some contracts under which the average cost per M.c.f. is 5 cents, the names of those being—

Mr. Culton: What State are you reading from?

Mr. Littman: I will read them across the line.

By Mr. Littman:

Q. To-wit—I will give the names of the vendors and then the gas field and the point of receipt, the amount, the number of M.c.f.'s purchased, and the average cost:

W. L. Sidwell Oil and Gas Company, Hugoton Gas Field, point of receipt Stevens County, amount $3,424.15, M.c.f.'s 68,483, average cost per M.c.f., 5 cents.

The same company, Hugoton Gas Field, point of receipt, Morton county, the amount is $3,316.60, the number of M.c.f.'s purchased is 66,332, and the average cost per M.c.f. is 5 cents.

The next one is Saturn Oil and Gas Company, the gas field is Hugoton, the point of receipt is Morton County, [fol. 3847] the amount, $13,592.90, the number of M.c.f.'s is 271,858, the average cost per M.c.f. is 5 cents.

Now, that same company also, as shown by this page here, delivers gas from the Hugoton gas field to Grant and Stevens counties in the amounts of $29,245.65 and $42,975.40, respectively, the number of M.c.f.'s being 584,973 and 859,508 M.c.f.'s, respectively, the average cost being 5 cents.

Also, there are shown to have been made to Panhandle Eastern by Southwest Kansas Oil and Gas Company from the Hugoton Field, the point of delivery being Stevens County, the amount being $10,061.45, and the number of M.c.f's being 201,229, at an average cost of 5 cents per M.c.f.

There are also shown to be some sales—well, let's confine ourselves for the moment to those which I have named in the Hugoton Field.

Mr. Culton: You agree that is not all the sales in the Hugoton Field?

Mr. Littman: There are others at 4 cents and I note one at 4½.

Mr. Wheat: While you are about it, why not read the names of the companies in the record so we will have them?

Mr. Littman: I will read any you wish.

Mr. Culton: I don't believe you called all the 5 cent companies, did you?

Mr. Littman: I called all the 5's. I will name the others.

[fol. 3848] Mr. Culton: Well, can't we stipulate there are numerous companies buying at 4 cents, some at 4½ and these which you have named at 5?

Mr. Littman: That is correct.

By Mr. Littman:

Q. Now, Mr. Biddison, in view of the fact that Panhandle Eastern Pipe Line Company has these contracts for the purchase of gas in the Hugoton Field at 5 cents per M.c.f., which is ½ cent higher than the so-called market price that you have placed on gas in the Panhandle Field, what opinion do you have with respect to giving us a little credit for the contracts that are higher than the market price of gas you have used, or don't you think that ought to be done?

A. I don't know what kind of credit you are asking for. The facts which you have related show that Panhandle Eastern Pipe Line Company is buying gas in the Panhandle Field at prices considerably lower than those generally prevailing in the Hugoton Field.

Now, I don't know what credit would be due to anybody on account of the Hugoton Field prices by virtue of that. I just don't understand it.

Q. Well, here is what I would like to know, Mr. Biddison: whether this so-called value of yours is made on a so-called one-way street basis, that is, whenever the contract is below 4½ cents per M.c.f., whether you want to put an amount in the rate base under the guise of value [fol. 3849] of contracts, and whether when the price that you pay is higher than the market value, whether you want to deduct something by reason of the contract being disadvantageous. What is your position on that?

A. Well, now, if there are some contracts higher than the gas value, I would give that consideration, and find out the reasons for it. I don't know of any that are higher than the gas value.

Q. Higher than what? A. Than the gas value.

Q. Well, here are some that I have named that are 5 cents, which price is ½ cent higher than that which you used as the basis of market value in your studies shown in Exhibit 39-A, page 965.

A. They are not in the Panhandle Field of Texas. They are in an entirely different location, 100 miles or more away, closer to the market, where the gas is produced under different circumstances with a different production

cost for gas, and you may have cited from the same page that in the Local Area in the neighborhood of Kansas, which is a still gas produced under different conditions, 300 miles further away, at different costs of production, that the prices are 7 and 8 cents.

Q. That is correct, and I believe that this exhibit does show that, 7 and 8 cents.

Mr. Wheat: What exhibit?

[fol. 3850] Mr. Littman: The annual report to which I have just referred and which Mr. Biddison has seen, does show that prices are paid as high as 7 and 8 cents in the Local Area.

By Mr. Littman:

Q. You, however, did not make any investigation of the contracts in the Hugoton Field, did you, Mr. Biddison, to ascertain the facts with respect to whether or not Panhandle Eastern was paying in excess of the market value to some vendors in that field? Did you?

A. I didn't conduct any investigation to determine that particular point. I did find out something about the prices being paid in that area.

As a matter of fact, I was somewhat familiar with those prices from having reviewed a similar compilation as the one which you have placed before me, but of about a year's higher age.

I don't know of any indication that Panhandle Eastern, under any gas purchase contract, is paying higher than the market value.

Q. Well, I believe you have already stated that you don't know what the market price of gas is in the Hugoton Field. Isn't that correct?

A. I have stated that there was considerable variation in that price.

Q. Well, the sum and substance of it all is that you [fol. 3851] did not make a similar study of the Hugoton Field such as that you have presented in Exhibit 39-A?

A. No. I made enough study to determine, in my opinion, that there was not enough difference between the contract prices Panhandle Eastern Pipe Line Company was paying and anything that might be construed as the

general field average, to justify placing any valuation upon the savings to be so effected.

Therefore, I didn't make any such determination of value.

Q. What investigation did you make? Please be specific, this time.

A. I made inquiry as to prices generally being paid, as to contracts for purchase of gas in the Hugoton Field.

Q. Of whom did you make inquiry, and what was the extent of your inquiry?

A. The extent of my inquiry was that I inquired of Mr. Hinton, who was production engineer, as to the prices being paid under the various contracts in the Hugoton Field, and based upon his information which he gave me in answer to my inquiries, I decided there was no material amount of saving to be effected under those contracts, under what might be construed as the average or general field price.

Q. Did you inquire of Mr. Culton too? A. I did not.

Q. Now, have you stated the entire extent of your inquiry on that subject? A. I have.

[fol. 3852] Q. You didn't ask Mr. Hinton the basis underlying his conclusions which you so readily adopted, did you?

A. I didn't adopt his conclusions, and didn't ask what conclusions he might have in the matter.

Q. What did you ask him?

A. I asked him the prices that were being paid under the contracts under which Panhandle Eastern Pipe Line Company bought gas in the Hugoton Field.

Q. And he told you, and you adopted what he told you. Is that it?

A. No, I didn't adopt it. I have not made any use of it.

Q. What did he tell you?

A. He told me what the prices were that were being paid.

Q. All right. By whom—give us the names of the companies—

A. By Panhandle Eastern Pipe Line Company to the producers of gas in the Hugoton Field from whom Panhandle Eastern Pipe Line Company purchases gas.

Q. I am asking you what inquiry you made with respect to the market price of gas? A. I didn't make any.
Q. That's what I thought.

* * * * * * * *

[fol. 3861] P. McDonald Biddison, a witness, having been previously duly sworn, resumed the stand and testified further as follows:

* * * * * * * *

[fol. 3862] Recross Examination (Continued).

By Mr. Chamberlain:

* * * * * * * *

[fol. 3879] Q. Now, I refer to Exhibit 108, which is your letter to Mr. Paxton, under date of December 13, 1937. You refer, to start with, in these words: "Provision for retirements, depletion and amortization for the year 1938", and in the body of the letter, you state that in keeping with his request, you have observed and compared the amount which the officers of Panhandle Eastern expected to suggest as the proper provision for retirements, depletion and amortization on a consolidated basis for the year 1938, and have found this amount, $2,055,000, is [fol. 3880] within approximately $60,000 of the amount which you consider proper and shall include in the report on the valuation of the Panhandle system properties which you have now in progress of completion.

* * * * * * * *

Q. Now, I call your attention further to Exhibits 109 and 110, in which you again refer to the provision for retirement, depletion and amortization on a consolidated basis, and, in the latter part of these two exhibits, you refer to the reserves for retirement, depletion and amortization at the end of the year, stating that they are reasonable reserves based on an estimated life of the properties.

Now, why, in those cases, do you use the word "retirements" instead of depreciation?

A. Well, in those letters, I am referring to the accrual to a fund ordinarily called a depreciation reserve account into which there would go accruals for the purposes which I have mentioned in these letters.

The intent of the expression is to include accruals for all purposes for which accruals are generally made to depreciation and depletion accounts.

. . . . . .

[fol. 3886] Q. In other words, then, we get right back to your depletion plan in Exhibit 67, and it is your judgment that you must indulge in a very considerable amount of speculation to determine the correct amount of the amortization charge or depletion charge?

A. Is that a question?

Q. Yes.

A. No, it is not. It is my opinion to do it that you have to make a rational estimate.

Q. First, you have got to determine the life of the field, have you not?

A. The life of the field needs to be determined, either as to years or as to its life in terms of units of production.

[fol. 3887] If it be determined first as to years, then that requires some estimate of the production during that term of years.

. . . . . .

[fol. 3894] Q. Now, your next speculation comes in the question of whether these wells will get their proportion of the reserves in that field, does it not?

A. Yes.

Q. And if the gas should be drained away and they did not get it, your estimate would be off again?

A. That is true.

Q. And if they had early wells and drained the others, it would get a larger percentage? A. That is right.

. . . . . .

[fol. 3895] Q. Now, in these Exhibits 109, 110 and 111, you have stated that, in your opinion, the reserves for retirement, depletion and amortization at the close of the year are reasonable reserves based upon age and estimated life of the properties.

Has anything changed your mind as to the estimated lives of this property since your letter of December 29, 1938, Exhibit 109?

A. I do not think so, no.

Q. In other words, when you wrote 109, it was your judgment that the property had an estimated life of 25 years?

A. I think I had in mind that it was safe to assume 25 [fol. 3896] years future life.

. . . . . .

Q. Let me ask, Mr. Biddison, the period you have used for the remaining life of the Texas Panhandle Field for amortization purpose?

. . . . . .

Q. I asked you what period you used?

A. The period which I used for the Texas Panhandle Field is to December 1, 1957.

Q. That would be 16 years, would it not?

A. Well, it is 26 years following December 31, 1931. It is 16 future years from 1941.

Q. Now, I would like to ask you what method you took [fol. 3897] to determine the proper accrual for depreciation, depletion and amortization on the Panhandle system in 1937 and 1938?

A. I determined a depletion unit for leases and wells. That unit was based upon reserves estimated by Ralph E. Davis and, as I recall it now, the future development costs were based upon the number of wells which he estimated to be required to produce the reserves.

I also estimated the accruals which would be required to meet the cost of retirements while the project was operative, and I combined these two with an estimate of requirements for a sinking fund for ultimate amortization. The general scheme by which I tested the matter at that time is about as I have presented the matter in this case.

. . . . . .

[fol. 3899] Q. Your system, as I understand it, is a comprehensive system which, in your judgment, if followed, will return to the utility the full investment and not appre-

ciably more during the period which you estimate to be the life of the field. Am I correct in that?

A. That is correct.

. . . . . .

[fol. 3901] Q. And in that year, by your Exhibit No. 111, you recommended as proper what Panhandle Eastern has suggested as a proper provision of $2,400,000, is that right?

A. That is the figure recommended as a proper figure for the year 1941, as shown in Exhibit 111, yes, sir.

. . . . . .

[fol. 3902] Q. Now, an accrual of $2,400,000 that you recommended included the amount that was being accrued for the amortization of gas contracts in the sum of about $336,000, did it not?

. . . . . .

A. For amortization of gas sales and purchase contracts, this exhibit shows for the year 1941, $329,110.13.

. . . . . .

Q. And you understood they were amortizing over a period of ten years at least $2,900,000 of gas purchase [fol. 3903] contracts, did you not?

A. Yes, sir.

Q. And your Exhibit No. 111 specifically provides that the amount is one which includes provision for the amortization of gas sales and purchase contracts, does it not?

A. Yes, sir.

. . . . . .

[fol. 3904] Q. Then for your accrued provision for 1941 of $2,400,000, about what portion would be for the depletion and amortization of property, as distinguished from the gas purchase contracts?

What I want, Mr. Biddison, is the continued relationship of that percentage to the property if it be true.

A. And for what period did you ask that?

Q. 1941. You approved $2,400,000. Now, if the $329,- [fol. 3905] 000 or whatever it is, $336,000, or some-

thing, be deducted, the balance would be for the amortization of property, would it not, including the depreciation and depletion?

A. Yes.

Q. All right. Now, will you make that deduction, approximately, and give us the percentage, in other words, that you accrued for the year 1941?

A. Well, the accrual for depreciation, depletion and amortization of plant, property and equipment as part of the $2,400,000 shown in Exhibit 111 would be about $2,070,890.

Q. That is right, and what percentage now would that be of your property account as of the beginning of the year?

A. About 3.19 percent on $64,854,956.29 of property account shown in Column F of Schedule 5 of Exhibit 106.

Q. Then without regard to the method you used in arriving at the proper amount of the accrual, it did maintain practical uniformity with your previous recommendations on the property account?

A. Yes.

. . . . . .

[fol. 3906] Q. Yes, but what I am trying to get at, I am trying to get the reason for this recommended departure from their policy as to these accruals.

Was your recommendation due to the fact that you did not think that what they were accruing during those years was sufficient to fully amortize the property within the period which you deemed to be conservative in judging its life?

A. Well, I realized that prior to about 1937, their accruals had been very low, but I did not make any determination as to whether there was an insufficiency as to one particular result or possibly some other result.

I simply conferred with them on what the accruals should amount to in view of the property that then existed, and started from that point on forward.

Q. Yes, I realize that too, and that before that time, there were reasons why those accruals were inadequate, but when you were asked to determine the amount which

[fol. 3907] would be proper and reasonable for those purposes, it necessarily implied the purpose for which the accruals were to be made, did it not?

In other words, whether it was merely for depreciation and depletion or whether it was made to cover both of those and the future amortization of the property?

A. Well, it was necessary for me to test it out as to whether the amount of money proposed to be set aside would accomplish the three-fold results of providing for depletion, for retirements while the property was operative, and, eventually, getting the capital sum back.

* * * * * * * *

[fol. 3910] Q. Now, let us see what you have recommended here, using your corrected exhibits and see if we understand now, correctly, what you feel should be accrued upon the present existing property for the entire purpose of amortization, depletion and depreciation plus, apparently, the amortization of gas purchase contracts.

Will you give us the amounts now that are necessary to be accrued?

A. From Exhibit No. 66-A, Line 14, Column C, Page 1, —$1,466,224.63 for amortization of property.

From Exhibit 68-A, Line 38, Column D,—$681,680.82.

This is for the purpose of meeting the cost of retirements which will be incurred while the property is operative.

Now, in addition to these amounts, there should be charges for depletion on the amount of gas produced. I do not have before me an estimate of the amount of gas to be produced for the year 1941.

Q. Didn't you read that amount into the record on November 27?

* * * * * * * *

[fol. 3911] The Witness: I have before me those figures which I think I read into the record at some stage of these proceedings.

* * * * * * * *

Q. I thought you did. I have it as of the date November 27, but I have a little larger amount. I have here $143,873.69. Do you have that?

A. I do not have that figure before me. That might be the figure based upon the estimate for the year 1941.

* * * * * * * * *

Trial Examiner: I have Mr. Wheat's statement here at Page 2782 of the transcript, and I will hand this to Mr. Biddison.

* * * * * * * * *

[fol. 3912] The Witness: On Page 2487 of the record, these two figures are explained.

* * * * * * * * *

That is my statement in reply to a question by Mr. Wheat.

Then, at Line 13, Mr. Wheat explains the figure he read is $136,614.11 and the figure for 1941, based upon the estimate of the actual gas volume for that year, and which I read into the record a moment ago, is $143,873.69, so the smaller figure represents the application of the depletion units which I determined to the actual production for the year 1940, while the larger figure is an estimate for the year 1941.

Q. Well, I assume that if you were attempting to arrive at the amount which should be accrued, you should use the larger figure, Mr. Biddison?

A. That is correct.

Q. All right. Now, the sum of the three is the amount which you indicate should be accrued, is it not?

[fol. 3913] A. That is correct, yes, sir.

Q. And what is that? A. $2,293,779.14.

Q. Then the careful study that you have made and the corrections that you have gone through have shown you that your suggestion as to a proper provision for 1941, as shown by Exhibit 111, was about $106,000 high?

A. It indicates that, yes.

* * * * * * * * *

Will you now give us the amounts which have been included in this accrual for the amortization of gas con-

tracts for purpose of subtracting that from the total amount of your amortization to ascertain the amount which is accrued upon the property account alone?

A. I think that amount is $317,384.50. It is composed of three items.

Q. I put down two items here, $293,218.64.

. . . . . .

And $23,910.67.

. . . . . .

A. There is a third item, Mr. Chamberlain, which you [fol. 3914] apparently missed.

. . . . . .

You will find the third item on Page 17, Column K, Line 26 of Exhibit 66-A in the amount of $445.19.

Q. Yes, I overlooked that. Will you deduct that, then, from the total amortization of $1,468,224.63, and give us the amount of the accrual upon the property alone?

A. $1,150,840.13 is the accrual on property alone for amortization.

Q. All right. Now, will you add the accrual for replacements and depletion, and give us the percentage that that bears to property, plant and equipment account?

A. The amount is $1,976,394.64.

Trial Examiner: What year is that for?

Mr. Chamberlain: 1941.

. . . . . .

Q. Now, will you use your machine and give us the percentage that that bears to your consolidated property, plant and equipment account at the beginning of the year?

. . . . . .

[fol. 3915] A. Using the figure from Exhibit 106, Schedule 5, of $64,854,956.29, the ratio is that of 3.047 percent.

Q. Yes. Now, referring to Exhibit 49, is it not a fact that the company by this exhibit shows that it proposes to accrue for amortization and depletion of the property $2,078,171?

. . . . . .

The Witness: $2,078,171.

. . . . . .

Q. Now, will you add to that the amount that they propose to accrue for amortization of gas contracts which appears to be in the sum of $336,486?

A. This makes $2,414,657.

Q. Then how much is that in excess of the amount which you have concluded would be the proper amount to accrue for all of those purposes?

A. $120,878.

. . . . . .

[fol. 3919] P. McDonald Biddison, a witness, having been previously sworn, resumed the stand and testified further as follows:

. . . . . .

Q. At our last session, you testified that in your Exhibit 66-A, you had provided for an annual accrual for amortization of gas contracts in the aggregate amount of $317,348.50, as I recall it.

Now, why did you provide in your amortization schedule for the annual accrual on these contracts?

A. Well, because they have to be amortized and this is an amortization problem that I was dealing with, so I included them with the other amortization.

. . . . . .

[fol. 3921] Q. And then did you make some effort before presenting your exhibit to this Commission to ascertain whether the book entries which you propose to amortize represented cost or value, or did you not?

A. I did not make any investigation of the matter. I took the book entries as being cost.

Q. And did you have any information from the company as to whether or not the book entries for gas purchase contracts in the sum, I believe, of $2,930,286.40 were write-ups?

A. No, sir, I did not.

Q. Did you have information that the other gas purchase contracts which appear on the ledger sheets and may [fol. 3922] be identified in Exhibit 52, Page 2, in the sum of $365,334.99 were write-ups?

A. No, sir, I did not.

. . . . . .

[fol. 3937] Q. Would the fact that the development of the business of Panhandle Eastern followed a normal or ordinary pattern entitle a utility, in your judgment, to have in its rate base an amount which represented a charge, or which represented an amount computed as the cost of carrying unused capacity if it had been possible for the officers to have readily sold the capacity of the line during the development?

. . . . . .

[fol. 3938] The Witness: I think I can best answer Mr. Chamberlain's question by a broad statement of opinion on this matter as I view the matter, and that is this:

I believe that when an operating company has become successful, has proved that its project was sound, has gotten on an operating basis where they are earning a fair return and have overcome all these difficulties of business attachment, that they are entitled to have considered as part of their rate base an amount representing what is the normal cost of development of business regardless of whether, during the early period of operation, they made money or lost money; regardless of whether, during the early period of operation, their judgment was sound or unsound.

The fact that the difficulties have been overcome and that the business has been attached adds a value to the project which it otherwise would not have. It adds a value above that of the cost of the physical elements of the prop-[fol. 3939] erty and anybody who sets out to buy a utility property would, in my judgment, pay more for the one which had overcome those handicaps that usually beset an industry than it would for one who was still in the throes of it.

. . . . . .

[fol. 3940] Q. But it is your belief that a business which has become a going business is entitled to that allowance, whether it had made money from the start or not, is that right?

A. That is right.

Q. And whether it could have made money had it been so inclined from the start, is that your feeling?

A. That is right.

• • • • • • • •

[fol. 3943] Q. If the stockholders in control of Panhandle Eastern were engaged in an illegal conspiracy to prevent the company from selling any more gas than such amount which pay only its fixed charges for the purpose of forcing the other and minority stockholder into bankruptcy and the security into an enforced sale, would you still say they were entitled to an allowance of what you term "cost of development," covering that period in which they were so engaged?

A. If they have developed the business and that expense would not be incurred by a purchaser, I think the value inheres and should be included in the rate base no matter what has been the past history or the past litigation, and I do not think it makes any difference whether the stockholders fought among each other or whether there were floods and storms.

The question is answered by what has happened as to the full development of the business at this time.

• • • • • • • •

Mr. Goodman: Mr. Biddison, in presenting a figure of development cost or development value, you made a certain [fol. 3944] use of what you considered to be the actual cost of carrying unused capacity, is that right?

The Witness: Yes, sir.

• • • • • • • •

Mr. Goodman: Now, you had in mind a certain normal pattern of development, did you not?

The Witness: Yes.

Mr. Goodman: And you then used the figures of development cost as something which corroborated your gen- [fol. 3945] eral estimate of what the normal situation as to development cost would be, is that right?

The Witness: No, I did not make any separate estimate of it.

Mr. Goodman: You found, did you not, first, that a company, and specifically this company, would be entitled on the basis of a normal pattern of development, to have an allowance in a rate base for the calculation of rates for development cost according to a normal pattern of development.

You then looked at the figures and saw that these figures were, in general, in accordance with such normal pattern and, therefore, you determined to testify to development costs in accordance with those figures.

Now, do I state it substantially correctly?

The Witness: Suppose I tell you what I did?

. . . . . .

Trial Examiner: I think perhaps, Mr. Goodman, you unduly limit the witness when you say "determined to testify."

Mr. Goodman: Yes, I think so. I think that part is bad. I want the question stricken, and I will try it again.

Now, Mr. Biddison, you had in your mind that a business such as this and, specifically, this business, ought to be entitled to an allowance in its rate base to be used in the [fol. 3946] calculation of rates for the cost of developing business, is that right?

The Witness: That is right.

Mr. Goodman: And you also had in your mind that that allowance should be something in accordance with a normal development pattern, isn't that right?

The Witness: That is right.

Mr. Goodman: You looked then at the costs of carrying unused capacity, is that right?

Mr. Wheat: What did you say? Is that what?

Mr. Goodman: You made yourself familiar with the costs of carrying unused capacity, as reported to you, is that right?

The Witness: That is right.

Mr. Goodman: And you found that those costs were in accordance with your idea, then, of the normal development pattern?

The Witness: That is right.

Mr. Goodman: And, therefore, you predicate your allowance upon the considerations which I have mentioned in my questions and which you have confirmed, is that right?

The Witness: That is right.

. . . . . .

[fol. 3948] Q. Now, if by the deliberate act of the management the date was deferred for many years in overcoming these initial difficulties incident to operating and taking on of patronage, would you say that the going value would be increased by the years of delay and measured by the cost of the carrying charges on the unused capacity?

A. I have not said anything about going value and I do not know what you mean when you use the words.

Q. Well, change it to cost of developing the business. I will state it again if you want it.

[fol. 3949] Is it your opinion that if the management of a company would deliberately and unnecessarily delay the development period and, by reason of their own negligence or desire, they delayed the overcoming of these initial difficulties incident to operation and the gaining of patronage for, let us say, nine years, would you say that they were entitled to add into the rate base an amount for the cost of development based upon the carrying charges of the unused capacity for the full period of nine years?

A. Not necessarily. It would depend upon whether or not the period was a normal period and whether the rate of development was a normal rate of development.

If, however, after all these things had happened, the business was finally attached and developed, then there is a value that inheres in the property which can be measured by the normal cost of that development.

Q. Then, that allowance would have no direct relationship to the amount of time which was consumed in overcoming these initial difficulties, I take it?

A. Only if the amount of time consumed were a normal amount of time.

Q. And then, in this case, you adopted 4½ years and you allowed the carrying cost of the unused capacity for the full period, did you not?

A. Yes, sir.

[fol. 3950] Q. And that was on the theory that that was merely a normal period of development of this business?

A. Yes, sir.

Q. And it is your philosophy here that the company is entitled to that allowance, whether the management actively engaged in overcoming these initial difficulties and could have overcome them within a year after the property was put into operation had they so desired?

A. Yes, sir, it is my opinion the value inheres in a property even if the management had actually attached all this business 30 seconds after they hooked up the last joint.

Q. You say it inheres in the business. Let me ask if it is your philosophy that the company is entitled to collect as against the public for an allowance in the rate base for the cost of such development which is unnecessarily delayed by the deliberate act of the management?

. . . . . .

Q. You would not allow it then, if the delay was purposefully caused by the management?

A. I would allow only that which would be a normal cost.

Q. Does that normal cost differ under different cir-

[fol. 3951] cumstances or is there some standard that you go by that you would allow a company or make the company an allowance without regard to its own individual development?

A. I think one can set up a measure of the matter from experience and development of business in such cases and apply it regardless of the actual history.

Q. Did you make any investigation, Mr. Biddison, to ascertain whether this period of 4¼ years was a normal period of development with respect to Panhandle Eastern Pipe Line Company?

A. I know from my own experience that it takes about five years to get the development of a business in the natural gas industry.

. . . . . .

Q. I asked you whether you had made any attempt to ascertain the facts with respect to this individual company?

A. Well, knowing that five years is a normal period to do it in, I come to the conclusion that this five years or [fol. 3952] substantially five years is a normal period.

Q. Then you were led to believe that this was perfectly all right because you considered that a normal period, is that right?

A. That is precisely it.

Q. And you made no attempt then to investigate to find out whether it could have been developed in a much less period, did you?

A. No, sir, I did not.

Q. You made no specific investigation of this company at all, did you, with respect to the policies and conduct of the management with respect to taking on business?

A. No, sir, I did not.

Q. And you have presented your exhibits in this case without having made any such investigations?

A. Certainly.

. . . . . .

Q. And you were in Texas when the pipe lines were built out from the Panhandle Field?

[fol. 3953] A. I was there when some of them were built from that area.

Q. Now, are you familiar with the experience of some of those lines with respect to putting on business?

A. Yes, sir.

Q. Tell us now how long the Natural Gas Pipe Line Company of America was in getting its business on?

A. I cannot tell you.

. . . . . .

[fol. 3954] Q. And now, what about Northern Natural? How long did it take them to put business on?

A. I haven't any statistics on Northern Natural before me. I know it took some little time to get the business on.

[fol. 3957] Q. And now you know it to be a fact, do you not, Mr. Biddison, that Northern Natural, by the sale of interruptible gas, boiler gas and dump gas, paid its way from the start?

A. No, I know that Northern Natural did sell some interruptible gas in its early history and I guess still does.

Q. Now, you know, as a matter of fact, that it made an outstanding record, do you not, simply by selling gas at a low price pending the time when the business would be developed and the sales made more to domestic and commercial consumers?

A. I understand they pulled themselves through a very critical period by doing that.

Q. And it was the same period that Panhandle Eastern went through, is it not?

[fol. 3958] A. I believe so.

Q. The time was identical, was it not?

A. I believe so, substantially so.

Trial Examiner: When you refer to a critical period, do you have reference to the condition of the particular company mentioned or to economic conditions generally prevailing?

The Witness: To the latter, producing the first effect.

[fol. 3976] Q. Mr. Biddison, did you not direct the making of Exhibit 38?

[fol. 3977] A. I outlined the policy for the making of Exhibit 38.

Q. And you had direct consultation with Mr. Morton about it?

A. Well, I had some consultation with him. I don't know whether it is properly referred to as direct or not.

Q. Well, so far as you know, he did what you asked him to do, did he not?

A. Yes.

Q. And these figures, if he has taken them down correctly, represent what you intended to have him represent, do they not?

A. Yes.

Q. And they are the basis upon which you have formed your judgment in suggesting to the Commission an allowance of five and a half million dollars in the rate base of Panhandle Eastern for the cost of business development, is it not?

A. For the cost of carrying idle capacity as an item in cost of business development.

Q. Now, will you refer to, let us say, Line 5, Column D, and state the amount of the investment in Panhandle Eastern as at the close of 1935 upon which—

. . . . . .

[fol. 3978] A. $37,716,811.

By Mr. Chamberlain:

Q. And is that about the average of the investment during that development period?

A. Very close to it, at least, according to the statement.

Q. Now, what per cent, then, is five and a half million dollars which you suggest as a normal allowance under the cost of business development, as compared with the investment?

A. 14.56.

. . . . . .

[fol. 3980] Q. What is the percentage that you have set up for the cost of business development as compared with the average cost of the property plant and equipment account as of the close of 1935?

. . . . . .

[fol. 3981] A. 16.05 per cent.

. . . . . .

The Witness: I divided the $6,053,992.48 at Line 33, Column B, Page 966 of Exhibit 39 by $37,716,811 shown at Line 5, Column D, of Page 1, of Exhibit 38.

. . . . . .

[fol. 3987] Q. Now, you found that this pipe line was erected toward such industrial centers as Indianapolis and Detroit, did you not?

[fol. 3988] A. Yes. Directed towards across Missouri and Illinois and the State of Illinois, eastern industrial center, there is a big industrial development in Indiana, and there is a big industrial development in Ohio, as well as a big industrial development in Detroit and other portions of southern Michigan.

Q. And did you make any study as to what efforts had been made by Panhandle Eastern Pipe Line Company to obtain sales contracts in either Indianapolis or Detroit prior to 1935?

A. I did not, nor any place else.

Q. Were you aware that the contract in Detroit was obtained after the Department of Justice had brought an antitrust action against the stockholders in control of Panhandle Eastern Pipe Line Company seeking to compel divestment of their interests in the pipe line?

A. Well, I knew some such action had been had, but I am not certain as to the sequence of events in regard to it.

At any rate, I didn't make an investigation of it in this connection.

Q. Did you make an effort to ascertain the policy of the management of Panhandle Eastern Pipe Line Company with respect to the sales of gas during this development period?

A. I did not.

[fol. 3989] Q. Did you know that they adopted the policy of refusing to sell natural gas to municipalities or to municipally-owned utilities?

A. No, sir, I did not.

Q. Would the refusal to sell gas have any bearing, in your judgment, as to the right to collect for the cost of business development?

A. I don't know what you mean by collecting for the cost of business development.

Q. Well, if the company absolutely refused to sell gas, would you base your claim for business development or the cost of development in the same way that you have made it in this case?

A. Well, I don't know. I would have to investigate the merits of the dispute before I could answer that.

Q. Well, I take it you would give them the same amount for four and a half year's cost of carrying this capacity, whether they could have sold the gas or not, is that right, during that period?

A. I don't know, I say I would have to investigate the merits of the dispute.

Q. Well, suppose there were no merits in it: it was simply a refusal to sell to a municipality, would there be any merit in that?

A. I would think so, Mr. Chamberlain, but I will repeat [fol. 3990] what I have previously stated several times, that after the business is attached, then I think it is proper to include in the rate base that amount which would be normal to be incurred in attachment of the business, regardless of the merits of all the past disputes they have had, and whether their policy was good or bad, and whether they took the business on quick or slow.

. . . . . .

[fol. 3991] Q. Did you make any inquiry whatsoever as to whether the management of Panhandle Eastern Pipe Line Company repeatedly refused to sell natural gas in territory which was being served by other utilities?

A. I did not. I have repeatedly so stated, that I didn't make any inquiries along those lines.

Q. All right. Now, you knew of the inquiry before the Federal Trade Commission with respect to Senate Resolution No. 83 of the 70th Congress which was reported in various parts of Document 92?

A. Yes, I know of that.

. . . . . .

Q. You have read various of the documents with respect to Panhandle Eastern that were published in those reports, have you not?

A. Yes.

Q. And you know the history of the company, in a general way, at least?

A. I have an idea of the history, yes. I don't know it in detail, but I have an idea of it.

. . . . . .

[fol. 3999] Q. Mr. Biddison, I am placing before you part No. 84-1 and part No. 84-a of the Federal Trade Commission reports in response to Senate Resolution No. 83 of the 70th Congress, being Document No. 92, and parts 84-1 and 84-2 and I would like to ask you to take a look at those, and the indexes, and see if you do not recognize them as volumes which have been in your possession and which you have scrutinized?

A. Well, I believe they are. I think I have copies of them in my files and I have referred to various volumes of this report, I think probably to these two upon occasion.

Q. I also hand you parts 82 and 83, and ask you if you have not had those and scrutinized them?

A. Yes, I have had those, and I have made some references to them in some studies I have made.

* * * * * * * * *

[fol. 4000] Q. And you have made no effort to look through those reports to see what the past history of the company has been with respect to sales?

A. I have referred to those volumes at various times for various purposes, but I have never read all of any of the volumes nor analyzed the information in there about the various controversies.

* * * * * * * * *

[fol. 4001] Q. Now, let me ask you one question. Did you or did you not read a copy of a letter written by Mr. T. B. Gregory to Mr. Minnig which happens to be printed on Page 375 of Part 82 and to relate to the matter of sales for some point in Missouri on application to the Panhandle Eastern Pipe Line Company?

A. I do not remember ever having read it. I might have, though, but I just do not know.

Q. Well, did Mr. Gregory ever tell you that he had refused sales from the Panhandle Eastern Line in 1934 for the reason that they had commitments of gas to be carried which would be sufficient to absorb the entire capacity of the line with a proper safety factor under normal conditions?

[fol. 4002] A. No, sir, Mr. Gregory did not tell me that, nor did he tell me anything else about Panhandle Eastern Pipe Line Company at any time.

I have never discussed Panhandle Eastern Pipe Line Company with Mr. Gregory nor any other pipe line company nor any other gas company.

Q. You will not say you did not read that letter, Mr. Biddison, I take it?

A. I will say I do not know whether I read that letter or not, I do not know. I may have, but I do not know.

Q. All right. Let me ask you whether you recall reading the testimony of Mr. William G. Maguire which appears on Page 401 and several pages following of part 82?

A. I do not know whether I read that or not.

Q. Do you know that you did not read it?

A. No, I say I do not know whether I did or not.

Q. In other words, you have no recollection if you did read it?

A. That is right.

Q. And I take it that you did not go back and examine these before you prepared your exhibit on the cost of business development?

A. I have so definitely stated, two or three times.

Q. And did you have information prior to making out that exhibit that the Kansas City Power & Light Company [fol. 4003] desired gas from Panhandle Eastern in 1932 and would take 10 million feet a day at around 13 or 13½ cents and that the management of Panhandle Eastern refused?

A. No, I did not.

Q. And you do know, however, that they went 200 miles farther and sold a large amount of industrial gas to the Atlas Cement Company at Hannibal, Missouri, do you not, at about 11 cents?

A. I do not know at what price they sold that gas.

Q. And you have not had the exhibits in this case which showed at what price they sold the gas?

A. No, sir, I have not.

Q. Now, do you recall reading in this Volume 82 in the testimony of Mr. Maguire that he had a commitment for sale of natural gas with the Great Lakes Steel Company at Detroit for use in their open hearths and soaking pits at Detroit?

* * * * * * * *

The Witness: No, sir, I do not know what contracts Mr. Maguire may have obtained.

By Mr. Chamberlain:

[fol. 4004] Q. You never heard of that?

A. I might have heard of it. I do not know. I have heard that company discussed some time or other as a possible gas market, but I do not know what the situation was in regard to the discussion now.

Q. And did you read in that same volume, 82, on Page 332 with respect to Mr. Maguire giving up the negotiations with respect to Mr. Gossler?

A. No, I do not. As a matter of fact, I read very little about the various arguments in those documents. I was interested in other matters.

Q. You knew that arguments had occurred, I take it?

A. Yes, at least I had heard that they had occurred. I had no personal knowledge of them.

Q. Did you not know that at the City of Fulton, Missouri, they requested gas service and had to fight the Panhandle Eastern through the Missouri Commission and the Supreme Court of the State in order to get it?

A. No, sir, I do not know anything about that matter.

* * * * * * * *

Q. Did you not see the controversy between Panhandle Eastern and that municipality printed in the papers and the trade magazines?

[fol. 4005] A. I might have. I do not know.

* * * * * * * *

Q. Do you remember anything about the controversy with Fayette along the same line?

A. If I did, I have no recollection of it and I do not know what the controversies were, if there were any.

Q. Now, did you make inquiry as to the form and amount of the rate that Panhandle Eastern sought to establish in Illinois in 1932 and 1933 during what you used as the development period?

A. I did not.

Q. You made no effort, I take it, to find out whether they made a rate which was too high to permit of its use by the public?

A. I made no investigation of it.

Q. Do you recall reading from the copy of the minutes of Panhandle Eastern which are printed in Volume 82 of Page 890, wherein the president of the company, then your friend Mr. Crawford, made the statement that it was agreed that any gas to be taken under the contract of September 17, 1930, by Columbia Gas and Electric Corporation would be for supplying Indianapolis and Northern Indiana territory extending to Detroit and other points in Michigan and connecting with existing pipe lines in Ohio and that [fol. 4006] it was likewise definitely agreed that any gas to be taken under such contract with Missouri-Kansas Pipe Line Company would be only for the purpose of supplying gas to southwestern Indiana through Terre Haute and south to Nashville, Tennessee, and that, "Panhandle Eastern Pipe Line Company hereby notifies both Columbia Gas and Electric Corporation, and Missouri-Kansas Pipe Line Company that it does not consider that either of them would be entitled to gas under such contract, if the gas is to be used in violation of the above agreement for the purpose of interfering with the distribution of gas by the other party."

Do you remember reading that?

A. I do not remember that.

Q. You have heard about that, haven't you, Mr. Biddison?

A. No. I have heard there were arguments about some contracts but I have never investigated what the argument was about, and have not been interested in such features as that in this connection or in any other connection.

Q. You had heard about the difficulties they had as to the allocation of territory, had you not?

A. I understood there was some question about the allocation of territory but I never investigated what the relative attitudes on the matter were, and I do not know anything about it now.

[fol. 4007] Q. Then you did know there was a dispute as to allocation of territory?

A. I have known there had been some such disputes, yes, but, as I say, I do not know anything about the attitudes of the various parties in the matter, have never made an investigation in the matter and have never attempted to find out about it.

Q. Do you recall the investigation which was instituted by the Counsel of the City of St. Louis looking toward a gas supply and the inquiry made of Panhandle Eastern for gas for that area?

A. I think there was some such thing as that about 1938, if I recall, but I do not have any information about the extent of the matter.

Q. That was much earlier than that, was it not, because their line was fully used in 1937.

A. Well, I recall that there was something occurred about the matter at about that time. About any earlier propositions on it, I do not have any information.

Q. Didn't you read in the public prints at that time that they refused to sell gas to St. Louis because that territory was being served by Mississippi River Fuel Corporation?

A. I do not recall ever reading any such thing. I read a great many things to which I do not attach enough importance to try to remember.

[fol. 4008] Q. Do you recall reading on Page 977 of Volume 82 a statement made by Mr. Munroe, who was then president of Columbia Oil and Gasoline Corporation, that the capacity of the line was about 80 million feet daily, but that you would not be safe in assuming over a 50 percent load factor and when Mr. Russell stated to him that any proposition could not be a success operating at 50 percent of capacity, Mr. Munroe replied, "Well, that is all we can expect."

Did you read that?

A. I might have. I do not know whether I did or not.

. . . . . .

[fol. 4009] Q. Now, in your testimony, you referred to the matter, as I recall it, along the line of an economy in the construction of a pipe line to build additional capacity for future use. Is that right?

A. I believe I made such a reference, yes, sir.

. . . . . .

[fol. 4010] Q. Well, may I read this to you from Pages 557 and 558:

"Panhandle Eastern would not have been justified in building a smaller line with the expectation of increasing from the 80 million capacity to the 125 million capacity by looping; it simply would not have been economical to have done so. You can make a rough comparison of it on the basis that a single 24-inch line, such as they did build, would cost about $30,000 per mile, and an 18-inch line, having, roughly, half the capacity of the 24-inch, would cost about $20,000 a mile; so that the two 18-inch lines would have cost about $40,000 a mile compared to $30,000 per mile for the 24-inch line."

Do you recall testifying in those words?

[fol. 4011] A. That sounds like what I said.

* * * * * * * * *

It is possible to build an 18-inch line under some conditions for around $20,000 a mile and, under other conditions, at about maybe less than $18,000 a mile. It is also possible on the 24-inch line that you might have a price variation from $30,000 a mile down to something less than $24,000 a mile, maybe down, in some instances, to as low as $22,000 a mile.

I did not try in that example to state the costs precisely for either size of line but to give an idea of the fact that when you got done, two 18-inch lines would cost you ma-
[fol. 4012] terially more than one 24-inch would cost.

* * * * * * * * *

Q. Well, you can tell the relative capacity of those two lines, can you not, how much more than double the 24-inch line will carry than the 18-inch line?

A. Yes, that can be calculated within a fair degree of accuracy.

Q. Would it not be a little over twice as much in the 24-inch line?

A. Well, I do not remember right now, except that two 18-inch lines is somewheres close to the capacity of the 24.

* * * * * * * * *

[fol. 4018] The Witness: I used that proportion of the cost of the actual system which was unused up until the capacity was required.

Q. That is right.

A. And I divided the cost of that system as between used and unused capacity in the ratio of loading to non-loading.

Q. Direct ratio?

A. Yes, sir.

Q. And not with respect to what the excess cost would have been or what the excess cost was over and above what it would have cost to have built the line for the 50 percent capacity?

A. In proportion to what the excess cost was, not in proportion to what the excess cost would have been if [fol. 4019] something else had been built.

Q. No, I will illustrate it this way. If you had a 50 percent capacity in your line used and the line had cost you any amount, let us say $30,000,000, you have then computed the cost of carrying this unused capacity on the basis of one-half of the total cost, have you not?

A. Yes, sir.

Q. And if you had to build a line to serve one-half of the capacity, it would cost you not one-half of that cost but more, would it not?

A. Yes, sir, it would.

Q. Then you are not computing your estimate of this cost on the cost of what was spent for the excess capacity, but directly proportionate to the demand which was made upon the line?

A. I am doing both. I am allocating the costs proportionately between used and unused capacity as those factors existed, and the cost which I am using in each case is the cost of that capacity.

. . . . . .

[fol. 4053] P. McDonald Biddison a witness, having been previously sworn, resumed the stand and testified further as follows:

. . . . . .

[fol. 4082] By Mr. Littman:

Q. Now, Mr. Biddison, you discussed the matter of the selection of the inspection points and the making of the inspections at some length in your redirect examination,

and you made numerous references to members of the Federal Power Commission's staff.

I believe you testified that on July 23, 1941, Panhandle Eastern Pipe Line Company invited the Federal Power Commission to designate some member of its staff to accompany you on your inspection tour. Is that correct?

A. I do not know that that is quite correct. As I recall it, my testimony was that at a conference on the preceding day it was decided to do that, and I knew that it had been done.

Now, it is possible that the day on which it was done was the 23rd, if the letter supports that date—I don't know [fol. 4083] exactly about that now without the letter before me.

* * * * * * * * *

Q. Then you testified that, thereafter, you had a conference with Mr. Zinder and with Attorney McAllister, both of the Federal Power Commission, did you not?

A. Well, I think I stated Mr. Zinder and Mr. McAllister, without qualifying their positions.

Q. Now, that conference was held on what date?

A. I believe that was August 1. I am not certain on that.

* * * * * * * * *

[fol. 4084] Q. Now, you had a map at that time which you had prepared showing the inspection points which you had proposed to visit, did you not?

A. Yes.

Q. And can you tell us at this time how many inspection points were on that map, that is, on August 2?

A. No, I think there were about 50 on there. I do not know the exact number now.

* * * * * * * * *

[fol. 4085] Q. Suppose you give us the conversation that was had at this conference with respect to these test holes and inspections.

Maybe that would be specific enough for you to recall. I am not asking you for the conversation word by word, but your best recollection of it.

. . . . . .

[fol. 4093] The Witness: I produced a map on which I had marked in pencil the proposed locations of about 50 test holes and explained to those present at the conference that, in addition to the number of test holes so located on that map, I thought there should be added about another 25 locations, that is, about 50 percent more; that with the addition of that number of holes, it was my idea that we had enough test holes to sample this property in view of its age and probable condition; that it was at least as many holes that I would think necessary to dig to examine the pipe in the case of a purchase and sale of the property.

By Mr. Littman:

Q. That was your part of the conversation, is that right? In other words, those are the things that you said in substance, Mr. Biddison?

A. Yes.

Trial Examiner: Proceed with your answer.

[fol. 4094] The Witness: I further suggested that the additional locations might well be selected by representatives of the Commission if they desired to do so.

Mr. Zinder and Mr. McAllister being present, both expressed the idea—

By Mr. Littman:

Q. (Interposing) Just a minute, I want the conversation now.

Mr. Wheat: As he best can recollect it.

The Witness: Both expressed the idea that the number of holes so selected would be sufficient. They were glad and so expressed themselves, that an extremely large number of holes had not been decided upon and a comparison was made in that respect by Mr. McAllister with some other utility, which one I do not now recall, as to the large number of holes dug or proposed in connection with a similar situation.

At the suggestion of Mr. McAllister or Mr. Zinder, I do not now know which, Mr. Neuner agreed—

By Mr. Littman:

Q. (Interposing) Just a minute, I object to what Mr. Neuner agreed. I want the conversation or the substance of the conversation.

Trial Examiner: Let him make his broad statement and complete it first, then you may go back over it if you wish.

. . . . . .

[fol. 4095] The Witness: Mr. Neuner agreed to furnish them with certain maps and I know an attempt was made to get those maps in the mail upon the same day so that those maps would be available to engineers of the Federal Power Commission in connection with location of test holes.

Now, that is the substance of the conversations as I recall them now on this matter.

By Mr. Littman:

Q. Did Mr. Zinder or Mr. McAllister tell you that you should not make any more inspections than you had planned to make? A. No.

Q. You were a free agent with respect to the number of inspections that you wanted to make, were you not?

A. Yes.

Q. For your purposes? A. Yes.

Q. And they were not telling you how many you would require for your purposes, were they? A. No.

Q. And you were not telling them how many they required for their purposes? A. No.

Q. Do you know the purposes, if any, to which they [fol. 4096] expect to put the inspections that they made?

A. Only what would be a natural supposition. So far as knowing, no, I do not know.

Q. Of course, the number of inspections that are made would be largely governed, would it not, by the uses or purposes to which the person who makes them intends to put them, isn't that correct?

A. It might well be.

Q. Well, now, was the word "sampling method" used in this conversation, to the best of your recollection?

A. Yes, it was.

Q. Who used it?

A. I did.

Q. Of course, you considered the inspection points which you had selected as adequate sampling for your purposes, did you not?

A. Yes, sir.

Q. I think you stated another 50 inspections were selected by you in addition to those which you first made on the map at the conference, is that right?

A. Another 25 or 30, as I now recall it.

Q. I believe you have stated that the Federal Power Commission representatives took no part whatever in the selection of those additional points, is that right?

A. That is correct.

[fol. 4097] Q. Now, are you undertaking to draw any inference or inferences from the fact that the Commission representatives did not object to what you did at any time, either at the inspection points or at the time when the inspection points were selected?

A. No, I am not drawing any inferences. I am merely testifying here.

Q. You would not say that it would be proper to conclude that there was an agreement, necessarily, as to anything simply because representatives of the Federal Power Commission were present and did not object to those things which you did? You would not interpret that to be an agreement, necessarily, would you?

A. No, not necessarily.

Q. So that we may be perfectly clear about this, I believe you mentioned that representatives of the Federal Power Commission took some soil samples at each of the inspection points, did you not?

A. Yes, sir.

Q. You did not object to that, did you?

A. Certainly not. They can have all the soil they wanted from around there—

Q. (Interposing) That is right.

A. (Continuing) So far as I was concerned.

Q. And you would not consider it proper for anyone to [fol. 4098] conclude from your failure to object that you agreed to the use to which the Federal Power Commission's representatives will put those samples?

A. Hardly, no.

Q. I believe you said you had about 50 points selected on the map when you came to the conference in Kansas City on August 2, that you selected some additional points. Why were additional points selected?

A. So as to embrace the total number which I originally had in mind to be inspected. I simply allowed I would select about two-thirds of them and allow engineers of the Federal Power Commission to select the other third.

Then, when they did not care to make the selection, I went ahead and completed the number.

Q. Then you went into the field to make the inspections with Mr. Bodner and Mr. Shattuck, and I believe you have described, in some detail, what each of you did.

Now, you referred to Mr. Shattuck as being Mr. Bodner's secretary, I think, on one occasion. You did not mean to infer from that statement that Mr. Shattuck did not get into some of the inspection holes?

A. I do not think I referred to him as being Mr. Bodner's secretary at all, and I distinctly stated that I thought that he had been in a number of the inspection holes, but that the general rule was that Mr. Shattuck kept [fol. 4099] the records and Mr. Bodner did the work in the holes. That was the substance of my statement in that respect.

* * * * * * * * *

By Mr. Littman:

Q. You testified at Page 3663 of the transcript:

"Now, in general, Mr. Bodner made the actual inspections of pipe and Mr. Shattuck made the notations directed by Mr. Bodner to be made. In other words, Mr. Shattuck generally kept the records and Mr. Bodner generally made the direct inspections of the pipe."

Then you made a further answer that doesn't relate to this particular point.

Isn't it a fact that Mr. Shattuck checked numerous measurements of pits, particularly at times when there was some disagreement as to the precise measurement of pits?

A. Mr. Shattuck did check numerous times, certainly. I have not precluded him from inspecting quite a number of times by making the observation that the general practice was for one man to make the observations on the pits and the other one to keep the records on it.

I am not trying to belittle the activities of Mr. Shattuck in that respect. I simply, in response to a question, stated what the general practice was. I did not keep a record as to how many holes Mr. Shattuck went into. It was not any of my business.

[fol. 4100] Q. You, as a matter of fact, do not know what representatives of the Federal Power Commission were doing, other than that which you saw them do, is that right?

A. Why, certainly that is right.

Q. That is, you did not know what was being recorded by them on their inspection sheets because you did not see their inspection sheets?

A. I never saw their inspection sheets. I do not know what they recorded on them.

Q. You did hear them call out pit depths and certain other observations that were made, did you not?

A. I did hear them call out pit depths and locations upon the pipe and I did see Mr. Shattuck making notations as Mr. Bodner called them out.

Q. Now, I believe your counsel was making some point about your not having seen the inspection sheets of representatives of the Federal Power Commission.

Now, you have testified, have you not, that you have never requested a copy of them, is that correct?

A. That is right.

Q. And you did turn over photostat copies of your inspection sheets to representatives of the Federal Power Commission, did you not?

A. Well, I made copies of mine available through some method. I have forgotten whether it was photostat or no., but I made copies available to them.

[fol. 4101] Q. And that was done only after request, was it not?

A. That is right.

Q. In other words, neither of you were necessarily supplying data to the other except upon request, is that right?

A. That is right and I have not asked for anything.

Q. The Trial Examiner, during the course of your redirect examination asked you whether or not the relations between the representatives of the Commission and yourself were harmonious or otherwise, and you stated at Transcript, Page 3680, as follows:

"They were absolutely harmonious. The relations were very friendly. I do not know of anything about which there was any disagreement throughout the trip."

Now, I want to make certain that I understand what you mean by the term "Disagreement." You are not inferring from that statement that there was an agreement as to what would be observed or the use to which any party was going to put the data?

A. No, sir. I mean only just what I said, that we did not have any disagreements. No matters arose about which we had argument and disagreement in connection with the work. We might have had some differences of opinion about political matters and social subjects and disagreed on those, but as to our work, we had no matters of disagreement.

* * * * * * * *

[fol. 4162] By Mr. Littman:

Q. There were some disagreements with respect to pit measurements, were there not, Mr. Biddison?

A. I would not say there were disagreements with respect to them. There were some occasions upon which the measurement of one party did not check with those of the other, and I think upon one or two occasions, some attention was called to that fact, but there was no attempt by either party to reconcile those measurements, although there were times at which one party or the other rechecked measurements if some comment had been made by the other that they did not check the figure.

Q. In other words, the observation record made by yourself and by the Federal Power Commission's representatives do not represent any agreed figures, do they?

A. No, sir, they do not. Each party put down the ob-
[fol. 4163] servations as he saw them without regard

to anybody else's opinion on the matter. It was seldom that any opinion was expressed but there were some occasions that the calling out of pit depths disclosed that the two parties making measurements had not gotten the same result.

. . . . . .

[fol. 4105] Mr. Littman: I desire, if your Honor please, to make a very brief statement with respect to these inspections.

I think our position can be made clear in this fashion.

It was kind and courteous of Panhandle Eastern to invite representatives of the Federal Power Commission to accompany Mr. Biddison on his inspection tour and, of course, we appreciate that.

It meant a matter of saving time and expense. I do not want anything that I have said to be construed otherwise.

. . . . . .

We entered into no agreement with Mr. Biddison with respect to what he should do or how he should do it. He was a free agent and I believe the testimony now is clear that we were free agents, each of us, utilizing the data [fol. 4106] in the manner in which we best see fit.

I am making this statement here simply because I think it would be unfortunate if counsel or anyone else were to endeavor to claim that we agreed necessarily with Mr. Biddison's method of doing things simply because we accompanied him on his inspection trip.

. . . . . .

[fol. 4113] Rufus M. Smith, a witness, having been previously sworn, resumed the stand and testified further as follows:

Cross-Examination.

By Mr. Littman:

Q. Mr. Smith, you prepared Exhibit No. 30, did you not? A. Yes, sir.

Q. Now, on Pages 1 and 2 of this exhibit, you state your qualifications and experience, do you not?

A. Yes, sir.

Q. Now, on Page 2, you state that "my duties as geologist for Panhandle Eastern Pipe Line Company have required me at all times to keep in close touch with development and producing conditions in the areas in which Panhandle Eastern owns reserves; watch the performance [fol. 4114] of the wells in those fields; and advise the management with respect to its producing operations," do you not?

A. That is true.

Q. Now, will you elaborate on your duties and give us a more detailed statement as to what you do?

A. Well, in keeping in touch with the development and producing conditions in the areas in which Panhandle Eastern owns reserves, we receive copies of logs of wells that are drilled by other companies and they are studied.

We receive sets of sand cuttings or samples from numerous wells drilled by other companies. These are filed and studied from time to time.

Q. What else do you do?

A. We make studies in regard to various conditions in this field, such as the location of water below the producing formations, the location of the first producing formations and the subsequent formations which produce gas.

Pressure maps, of course, are made as we constantly watch the decline of the rock pressure in the field.

Q. Who is your immediate superior?

A. Mr. H. W. Pope.

Q. What is your official title? A. Geologist.

Q. What is Mr. Pope's title?

A. Superintendent of Land, Lease and Production.

[fol. 4115] Q. Is it a part of your duties to determine what acreage shall be acquired by Panhandle Eastern Pipe Line Company?

A. I am consulted on that, often times.

Q. Who consults you on that? A. Mr. Pope.

Q. Who makes the ultimate determination as to whether a lease should or should not be acquired, you or Mr. Pope?

A. Mr. Pope, in conjunction with the management of the company, Mr. Neuner and others.

Q. And is the same true with respect to acreage that is abandoned or disposed of? A. Yes, sir.

Q. In other words, Mr. Pope calls you in for consultation? A. That is true.

Q. But he makes the ultimate decision?

A. That is true.

Q. In conjunction with the management?

A. I merely recommend.

Q. And what is the fact with respect to well locations, and by that, I mean locations at which wells are to be drilled?

A. When the fields are such as they are, well locations are usually made more on lease requirements than most anything else.

Q. Who makes the ultimate determination with respect [fol. 4116] to the drilling location?

A. The same gentlemen, Mr. Pope and the others.

Q. Are you called in to consult with the others, as well? A. Make recommendations.

Q. Have you ever advised the company as to the gas reserves in acreage which it owned or contemplated leasing?

A. In a general way.

Q. When did you make such an estimate last?

A. I say in a general way; by that, I mean relatively. If there are several tracts which are available, one might be a better one to obtain than another by its location in respect to the field boundaries, so it would be a relative proposition, rather than a specific reserve per acre.

Q. In other words, your estimates in that connection would not be that you have concluded that so many cubic feet of gas will be found in any particular acre, is that right?

A. That is true.

Q. Have you ever made such an estimate for the company as that which I have just described? That is, a given estimate of reserves per acre or for a number of acres?

A. Yes, I have.

Q. When did you last do that?

A. I made up an estimate of that kind within the past two months.

[fol. 4117] Q. Are you speaking of the estimate that is contained in Exhibit 30?

A. There is one made since then for the company.

Q. Will you please give us a general description of the estimate?

A. It conforms practically to the figures which I used in Exhibit 30, practically the same per-acre figures as are used in Exhibit 30.

Q. Does it look like Exhibit 30, that is, I am referring to the estimate?

Mr. Culton: I am wondering if counsel really understood what he meant.

Mr. Littman: Perhaps I didn't.

Mr. Culton: He said he used the same per-acre figure that he used in Exhibit 30.

By Mr. Littman:

Q. Did the estimate which you just made and submitted to the company show the reserves based on the eight different abandonment pressures used in Exhibit 30?

A. It was not a total figure. It was merely a per-acre figure. That was given to the accounting department for, I believe, their setting up some records in which the reserves will be depleted annually under each separate lease according to the production which comes out of each separate lease.

Consequently, the reserve for each lease was calculated [fol. 4118] from the average per-acre reserve figure times the number of acres in the lease.

The abandonment pressure used there, I believe, was 50 pounds.

Q. In other words, if I understand you correctly, your most recent estimate submitted to the company stated that the original amount of gas per acre was 17,700 M.c.f. for what you have designated as Class 1 acreage and 5,000 M.c.f. for acreage classed as Class 2?

A. Yes.

Mr. Culton: In which field?

Mr. Littman: In the Texas Panhandle Field.

By Mr. Littman:

Q. Incidentally, we are talking about the Texas Panhandle Field, are we not? A. I assumed that.

Q. Inasmuch Exhibit 30 relates solely to that field?

A. Yes.

Q. Perhaps it would be well to have that understanding at the outset.

Mr. Culton: I thought the record should be clear that that is what we are talking about.

Trial Examiner: It might be inquired at this point, however, whether Mr. Smith is thoroughly familiar with the Hugoton Field also.

[fol. 4119] By Mr. Littman:

Q. Are you familiar with the Hugoton Field?

A. Yes, sir.

Q. Thoroughly familiar with it, as the Trial Examiner has inquired?

A. There may be some question about what thoroughly means.

Mr. Culton: I think we stated during the examination that both Mr. Smith and Dr. Bartle had worked together in connection with the Hugoton Field but, in order to expedite the evidence, we had had Mr. Smith prepare the figures for the Panhandle Field and Dr. Bartle prepare the figures for the Hugoton Field.

Trial Examiner: I assume, Mr. Smith, your duties are equally in the two fields now?

The Witness: Yes, sir.

By Mr. Littman:

Q. Do you have your acreage map for the year 1932 which has been identified in this case as Exhibit 19?

A. No, I do not.

Mr. Culton: We did not know what maps you wanted to examine him about. You had copies of them. There was no reason for us to anticipate—

Trial Examiner: Mr. Smith, here is a copy of that map.

(Whereupon, a copy of the map referred to was handed the witness.)

[fol. 4120] By Mr. Littman:

Q. Now, on this map, which has been identified as Exhibit 19, you show in colors the acreage controlled by Panhandle Eastern Pipe Line Company as of March 31, 1932, do you not?

A. That is true.

Q. Now, does that include the acreage which was subject to gas purchase contracts or does it just include the acreage which was held by Panhandle Eastern?

A. There is no gas purchase contract acreage shown.

Q. There was some acreage, however, subject to gas purchase contracts as of March 31, 1932, was there not?

A. I believe that there was one or possibly two, gas purchase contracts at that time.

Q. But that acreage you have stated is not shown on that map?

A. It would be a very small amount, possibly 1,280 acres, or some such matter.

Q. What is the purpose of this map which has been identified as Exhibit 19, Mr. Smith?

A. It was prepared to show the difference between the acreage picture in the early history of Panhandle Eastern Pipe Line Company as against the present acreage pattern of Panhandle Eastern in Texas Panhandle.

Q. Did you use this map in connection with making your estimate of the reserves in the Panhandle Field?

[fol. 4121] A. No, sir.

Q. You did not submit a map showing the situation as of 1933, did you? A. No, sir.

Q. Or as of 1934, 1935 or subsequent years?

A. No, sir, only 1941.

Q. 1941. Why did you select 1932 rather than 1933 or 1934, or some other year?

A. 1932 was approximately the time Panhandle Eastern began taking gas from this area.

Mr. Littman: If your Honor please, perhaps it would be well for us to note our objections to the exhibits as we discuss each, in order that your Honor will have in mind the objection in connection with the particular testimony as the testimony is given.

We object to this exhibit for the reasons stated by the witness, that it serves no useful purpose in this case other

than to clutter up the record. It was not used by this witness in arriving at his estimate of reserves and merely shows the acreage picture as of some nine years ago, and it has no bearing whatever upon the issues involved in this proceeding.

We think that while it is harmless, to use your Honor's term, it does unduly encumber the record, and we are very anxious that no needless exhibits be in the record, and we feel it our duty to object on the ground of immateriality.

[fol. 4122] We shall note our objections to these exhibits as they are discussed.

Trial Examiner: Very well.

By Mr. Littman:

Q. Now, will you please turn to your next exhibit, which has been identified as Exhibit 20, this exhibit being named, "Present Acreage Map."

Mr. Smith, I do not believe you have stated in your testimony, and I do not believe you show on this map, as of what date the map speaks, and I would appreciate it very much if you would tell us the date.

A. That was an oversight. It should show as of June 30, 1941.

Q. And the legend on the map merely shows, does it not, the ownership of the leases indicated? A. Yes, sir.

Q. Very well. Now, if you will please turn to Exhibit 21, which appears to be a contour map. I will ask what you conceive to be the purpose of this map?

A. It shows the location of the Amarillo Gas Field in the Texas Panhandle and the subsurface structure of said gas field.

Q. Would you give us a concrete example of these elevations and tell us what is indicated on the map?

A. The map indicates that the top of the Wichita-[fol. 4123] Albany Anhydrite would be found on the John Ray Dome at 1500 feet above sea level, the John Ray Dome being located in north central Potter County.

Q. That sand which you have just named is one of the producing sands, is it? A. No, it is not.

Q. What is it?

A. It is a marker that is used by geologists in determining whether or not the formation is running high or low and, in a way, predicts the quantity of the gas to be obtained after the well is completed.

Q. Don't these contours show the elevations above sea level of the top of the Panhandle Lime? A. Yes, sir.

Q. Is the Panhandle Lime another name for that structure which you just gave a moment ago?

A. The Panhandle Lime is another name for Wichita-Albany. However, the top of the Panhandle Lime is not productive and the Panhandle Lime is really not a lime.

The top of it isn't. It is an Anhydrite.

Q. Now, the contours that you are measuring on this map are measured from the top of a structure, are they not?

A. It indicates the contours found on the structure and, roughly, gives you a picture of what the structure [fol. 4124] looks like with a high point over here (indicating), another higher point at another place on the map and it slopes toward the flanks with the fault at the south side.

Q. Well, what does that have to do with the producing structures?

Mr. Culton: Counsel, if you would use the words "producing formation" instead of "producing structure," you would be talking some language that the witness could understand.

The structure does not produce. It is the formation that produces.

Mr. Littman: Well, I used the term "producing sand" or "sands" a moment ago.

Mr. Culton: That is all right.

By Mr. Littman:

Q. I understand there are various terms for these things. Which would you prefer to use, Mr. Smith?

A. Sands or formation, either is proper.

Q. Sands or formation, very well.

Will you please explain what relationship these contours have to producing sands in the Panhandle Field?

A. It indicates the underlying producing structure.

Q. Does one conform with the other?

A. Substantially.

Q. The thing that disturbs me is, Mr. Smith, and I do not clearly have in mind, is how far above the producing [fol. 4125] sands are these elevations that you have shown on this map?

A. Approximately 800 feet.

Q. And the convolutions of the one are followed generally by the other?

A. That is true. This is a good marker for that reason. This has been selected and has been used for years to make contour maps on structures in the Panhandle of Texas.

Q. I see. Will you please state what relation exists, if any, between the elevations shown on your contour map, Exhibit 31, and the gas reserves in the Panhandle Field?

A. The principal relation between this contour map and the gas reserves in the Panhandle of Texas is that, generally speaking, the above-average producing acreage is found on the high points of the structure and the below-average producing acreage is found on the edges of this structure.

Q. Now, do I understand your testimony then to be that acreage located near the top of the structure is more favorably located for production of gas than acreage located on the lower parts of the structure?

A. Generally speaking, that is true. However, there are numerous exceptions to that rule.

Q. But that is a general rule, is it not?

A. That is true.

Q. Now, I believe you testified in your Exhibit 30 that the leaseholds of Panhandle Eastern Pipe Line Company [fol. 4126] are, "favorably located for the production of gas", did you not?

A. Yes, sir.

Q. And that testimony, I take it, is predicated upon the fact that Panhandle Eastern's acreage is, in fact, located along the top or near the top of this structure?

A. That is true, generally speaking.

Q. Now, you do not show on this map the location of Panhandle Eastern's acreage and so I shall ask you to

state, generally, the location of Panhandle Eastern's acreage with respect to the contours of this map.

(Whereupon, the map was handed the witness.)

Mr. Culton: Is that the same map now?

The Witness: Yes.

Acreage controlled by Panhandle Eastern Pipe Line Company in Carson County, lies generally above the 1300-foot contour. In Potter County and southern Moore County, Panhandle Eastern Pipe Line Company's acreage lies generally above the 1100-foot contour. Is that sufficient?

By Mr. Littman:

Q. Isn't there some acreage located above the 1500-foot contour, Mr. Smith?

A. Yes, sir, there is.

Q. Approximately how much, roughly?

A. Probably 1000 acres.

Q. I note in your 1941 acreage map to which we referred [fol. 4127] a moment ago, Exhibit 20, there were numerous open spaces in the Panhandle Eastern's acreage, and by that I mean, a kind of checker-boarding situation that exists. Is that generally correct?

A. That was explained, to a certain extent, in my testimony, that Panhandle Eastern originally designed their acreage pattern when the field was new, to make a checker-board pattern that way, so as to at least have some of the better acreage, if not all, even though they might have to surrender some of the poorer acreage at a later date.

Then, as time went on, an attempt was made to obtain more premium acreage, so to speak. However, it was impossible by that time, to acquire solid blocks. That, I think, explains the so-called open spaces in our acreage pattern now.

Q. Now, having in mind the situation which you have just described and the generally favorable location of Panhandle Eastern's acreage, what would you say with respect to the desirability of Panhandle Eastern's acreage in so far as drainage is concerned?

A. I would say it was in an average position.

Q. With respect to those open portions representing leases that are owned by others, do you know whether or not there are offsetting wells on those leases, generally?

A. In a great many cases; there are.

Q. And in many cases, there are not?

[fol. 4128] A. I would say in a few cases there are not, but in the majority of the cases, there are offsetting wells.

Q. Now, the fact that Panhandle Eastern's reserves are situated near the highest structural point of the entire Panhandle Field would indicate that Panhandle Eastern's acreage would be among the last to be ultimately abandoned, isn't that correct? A. Not necessarily.

Q. Well, I have in mind, particularly, encroachment of water. Wouldn't the fact Panhandle Eastern's reserves are located along the highest structural point be a favorable factor in that regard?

A. That would probably be true, except for a, you might say, unnatural condition, or maybe an unexpected condition, which apparently is developing on the northeast portion of the field.

It appears now that water is coming in rather rapidly in east central Moore County. You might call it a finger appears to be projecting itself southwestward through that portion of the field.

Q. So that the acreage that is in the path of this encroachment and which is located along the lowest structural points will be the first to be abandoned for that reason? A. Yes, sir.

Q. And those which are located along the top of the [fol. 4129] structure will be the last to be abandoned?

A. They will be later.

Q. Yes. Is this water encroachment to which you have just referred encroaching upon the Panhandle Eastern's acreage?

A. Yes, sir, and it has made itself evident in the last two and three years.

Q. Has Panhandle Eastern abandoned any operated leases by reason of that? A. No, sir.

Q. Has it abandoned any other leases by reason of it?

A. No, sir, not up to the present time.

Q. When you state that Panhandle Eastern's acreage is favorably located for the production of gas, does that, or

does that not, mean that greater production per pound of drop in rock pressure will be obtained than on the average in the field?

A. Yes, I think it indicates that greater production per pound-drop will be produced from above-average acreage than average or below-average.

Q. Is that due to migration or due to the fact that the acreage had more gas under it to start out with?

A. I would say, due to the fact that it had more originally.

Q. Now, if you will look along toward the top of the map which indicates the north, you will observe two of your contour lines which are marked 900 feet. I notice that they [fol. 4130] do not join. If you had extended this map further to the north, would you have joined those two contour lines somewhere?

A. I think you will find on another exhibit that those lines are dashed up there as probably being located there, but not positively being located at that position.

Q. Can you give us the number of the exhibit to which you have just referred?

A. I think it is the 1941 rock pressure map.

Mr. Culton: We have no 1941 rock pressure map in Texas.

The Witness: No; but it does show the outline of the field, I think, Mr. Culton.

Mr. Culton: Mr. Smith, will you state just exactly what you are pointing out to counsel, and from what map you are pointing?

The Witness: On Exhibit 27 which shows the outline of the Texas Panhandle Field as well as the approximate outline of the Hugoton Field, north of the north line of Moore County, the lines outlining the field are dashed rather than solid, due to the fact that the exact location of the boundaries of the field are not known.

By Mr. Littman:

Q. Now, do these dashed lines on Exhibit 27 represent the 900-feet contour?

A. Approximately. However, this is not a contour map and merely attempts to show the approximate outline of the field.

[fol. 4131] Q. Now, I gather from your testimony, Mr. Smith, that there is considerable doubt as to where the Panhandle Field ends up at the north and where the Hugoton Field begins. Is that a correct statement?

A. There is considerable doubt as to whether the two fields join at all.

Q. And why is that a matter of doubt?

A. Because there has not been sufficient development up to date to prove whether it does join or does not join.

Q. You mean to say, there has not been sufficient drilling, when you speak of development?

A. Yes, sir.

Q. Before we leave Exhibit 21, I note you have a line running diagonally like that is designated "A" at one end and "A" at the other.

Mr. Culton: A^1.

By Mr. Littman:

Q. "A" and "A^1".

A. That indicates a location of a cross-section which appears in a later exhibit. However, the cross-section is generalized and does not intend to show exact conditions existing along this A-A^1 line.

Q. Well, we will get to that in just a minute. I believe that typical structure which you have just referred to appears in your next exhibit, which is numbered Exhibit No. [fol. 4132] 22 and we will come to that very shortly. That is why I wanted you to make it clear that your cross-section is supposed to represent this line, is it not, which you have referred to as A-A^1?

A. Roughly. However, I do say that the cross-section has been generalized and does not pretend to show exact conditions existing along that A-A^1 line.

Q. I notice that the A-A^1 line does not run through very much of your Panhandle Eastern acreage, does it?

A. No, it does not.

Q. Is our understanding correct, that it misses the bulk of Panhandle Eastern's acreage and actually goes through perhaps two or three leases, is that correct?

A. That is true. However, we did not prepare the cross-section to show conditions existing under Panhandle Eastern's acreage or conditions existing under any particular acreage, but merely to give an idea, in a general way, of

the conditions that exist in the Panhandle Field below the surface.

Q. Suppose we have a look at Exhibit 22, which is the "Panhandle Cross-Section" and perhaps we can then better discuss the situation from that.

Trial Examiner: May I ask at the outside, Mr. Smith, whether your chart marked for identification as Exhibit 22 is prepared on commercial print?

The Witness: No, sir, this is not commercial print. It [fol. 4133] was prepared in our drafting room, but was partially taken from a text book.

Mr. Culton: Give the Examiner the name of that textbook.

The Witness: "Geology of Natural Gas", which was edited and compiled by Henry A. Ley.

Mr. Culton: Was that also in Cotner and Crum's article in Geology of Natural Gas?

The Witness: An article in that Geology of Natural Gas book just referred to, written by Cotner and Crum, contained a cross-section similar to this one in the exhibit.

By Mr. Pittman:

Q. Now, you stated that this cross-section was taken, in part, from the source which you named and was prepared, in part, in your drafting room.

Would you mind stating for us which part was prepared in the drafting room and which part was prepared from the sources which you named?

A. The general print was copied almost exactly from the textbook. The coloring was put on to show generalized conditions existing in the Panhandle Field.

Q. Did you designate how these colors should be put on this map? A. Yes, sir.

Q. But you did not personally prepare the printed portions of this map?

[fol. 4134] A. No, it was prepared in our drafting room.

Q. But from the source that you named?

A. Yes, sir.

Q. Mrs. Peterson—was that the name?

A. No. It is taken from an article written by Cotner and Crum appearing in Henry A. Ley's book, "Geology of Natural Gas", published by the American Association of Petroleum Geologists.

Mr. Wheat: Do you know the date, approximately?

The Witness: I do not remember, exactly, the date. I have a copy of the book at the hotel and will be glad to bring it over and show it to you gentlemen if you like.

By Mr. Littman:

Q. Mr. Peterson did not have anything to do with this map?

A. No, sir. I assume you refer to Mr. Peterson with the Texoma Natural Gas Company?

Q. Yes.

. . . . . .

By Mr. Littman:

Q. Do you have before you Exhibit 22, "Panhandle Cross-Section"?

A. Yes, sir.

[fol. 4135] Q. Is that an actual cross-section?

A. No, sir.

Q. What does it represent?

A. It is a generalized cross-section representing typical conditions existing in the Amarillo Field in the Texas Panhandle.

Q. What is the horizontal scale of this cross-section?

A. I do not know.

. . . . . .

[fol. 4136] By Mr. Littman:

Q. Can you state, Mr. Smith, the point on this cross-section where the well, for instance, where this well is located that you have shown on this cross-section?

Trial Examiner: Isn't there some relationship between the structures shown in Exhibit 21 for identification and Exhibit 22 for identification?

The Witness: Yes, sir, that was brought out by a question by Mr. Littman.

Trial Examiner: If you follow through that relationship, wouldn't you give us some information of importance with reference to Exhibit 22 for identification?

The Witness: Exhibit 21 shows the location of the John Ray Dome in north central Potter County. The location of John Ray Dome is also shown on the cross-section on Exhibit 22.

By Mr. Littman:

Q. Pardon me; where is that shown?

A. At the upper left-hand corner of the map, or rather the cross-section.

Q. Where is this well that is shown on this typical cross-section located?

A. The approximate location of the well shown on the typical cross-section is where the line A-A' crosses the Moore-Hutchinson County line.

[fol. 4137] Q. Well, is that an actual well?

A. No, sir. There are wells which exist there.

Q. But the well shown on this cross-section is a hypothetical well?

A. That is true.

Q. You could not tell me, for instance, where the point on the cross-section which is located, let us say, two inches to the right of this hypothetical well is located on any map, could you?

A. Approximately.

Q. But not exactly?

A. No, sir.

Q. Can you give us the name of the wells which establish the various elevations shown in this so-called cross-section?

A. No, sir; I cannot definitely. However, there are numerous wells which exist along the line A-A' which might have been used in establishing this cross-section.

Q. You do not have any personal knowledge of that, do you?

A. No, sir. The principal reason we made an exhibit of this kind, Mr. Littman, is that I could have made a detailed cross-section using actual wells which exist in the Amarillo Field, but time was so short we did not have sufficient time to make an exhibit of that kind. Consequently;

[fol. 4138] we generalized a cross-section which was already available.

Q. Can you testify from your own personal knowledge that the situation which is shown to exist at the point where this hypothetical well is shown on this cross-section actually prevails as it is shown here?

A. I cannot tell you where it does actually prevail. However, there are probably dozens of wells in the Texas Panhandle where such a condition does exist.

Q. Do you mean to say there is in existence a well whose log will show exactly the situation which you have shown at the point indicated by the hypothetical well?

A. I believe there are.

Q. You cannot give us the name of any such well, can you?

A. No, sir.

Trial Examiner: May I ask about your Exhibit 21, whether 900-foot contour, with possible exceptions, represents the outer boundary of the productive area?

The Witness: Not necessarily.

Trial Examiner: Is there a relationship?

The Witness: Only in this way, that the 900-foot contour is getting rather low on the structure. However, you will notice in Exhibit 21 that wells appear outside the 900-foot contour in northwestern Moore County, and also appear outside the 900-foot contour in northwestern Hutchinson County.

[fol. 4139] Mr. Culton: Mr. Examiner, in view of the Examiner's question a while ago, I desire to present for his inspection the Cotner and Crum drawing from which this was taken, showing there is no horizontal scale shown.

The witness can testify that is the one from which he got the cross-section.

(Whereupon, a book was handed the witness.)

By Mr. Littman:

Q. Now, the drawing to which Mr. Culton has just referred does not seem to me to resemble very closely the drawing which is shown in Exhibit 22.

Mr. Culton: I would like to ask the geologist if he thinks it resembles it.

Mr. Littman: I was just going to ask him.

Mr. Culton: Ask your own geologist if it resembles it.

The Witness: It was taken directly from this cross-section printed in the article referred to.

Trial Examiner: Mr. Smith, your answer does not relate to anything preceding it in the record. You are now referring to Exhibit 22 for identification and the work to which Mr. Culton made reference and the statement you have just made relate to the cross-section which was previously discussed. Is that right?

The Witness: I mean by the article referred to, the book titled, "Geology of Natural Gas", edited by Henry A. [fol. 4140] Ley, published by the American Association of Petroleum Geologists at Tulsa, Oklahoma, in 1935, in which an article appears entitled, "Geology and Occurrence of Natural Gas in Amarillo District, Texas", by Victor Cotner and H. E. Crum, beginning on Page 385.

Mr. Culton: Where is the cross-section? Is it paged?

The Witness: The cross-section appears on the back of Page 387—it is actually Page 388.

Trial Examiner: Following up the question I asked a moment ago, you say there is gas production outside of the area defined by the 900-foot contour?

The Witness: Yes.

Trial Examiner: Referring now to Exhibit 21 for identification?

The Witness: Yes, sir.

Trial Examiner: Is it the general agreement or consensus among geologists and the practical gas men in the field as to the location of the 900-foot contour?

The Witness: At the time this map was made, Exhibit 21, that was the location of the 900-foot contour, as near as could be placed.

However, subsequent drilling may have revised the location of that 900-foot contour.

Trial Examiner: These contours are under constant revision, are they not?

[fol. 4141] The Witness: Yes, sir.

Trial Examiner: What would you say as to the situation now? Do the contours shown on your Exhibit 21 for identification represent the consensus among gas men in that area at the present time?

The Witness: In a general way.

Trial Examiner: What do you mean by that?

The Witness: I mean by that, that there has been no great revision of the general idea of this geologic structure in the past five or six years.

Trial Examiner: Has the exploration that has occurred in the last five or six years resulted in any marked extensions?

The Witness: Only to the northwest.

Trial Examiner: How extensive have those been?

The Witness: I believe that it has extended the field probably three to five miles.

Trial Examiner: That would involve a very large acreage, would it not?

The Witness: Quite a bit.

Trial Examiner: It would run into thousands of acres, would it not?

The Witness: Yes, sir.

Trial Examiner: And that process of exploration outside of proven gas fields is still continuing, is it not?

[fol. 4142] The Witness: Yes, sir.

Trial Examiner: Would you say that in any direction from the proven fields, the tests have been sufficient to liminate further extension of the present proven fields from the standpoint of production of gas?

The Witness: The field is fairly-well defined by production and dry holes at the present time. However, it might be extended to the northeast by small wells, to the northwest, but I do not believe it will be extended to the south any further than it is presently known.

Trial Examiner: How old is this field at the present time?

The Witness: Approximately 15 years.

Mr. Littman: You were speaking of the Texas Panhandle Field, were you not?

The Witness: Yes, sir.

Trial Examiner: Will you pardon the interruption, Mr. Littman?

Mr. Littman: I am glad to have you interrupt at any time to clear up any points of uncertainty.

By Mr. Littman:

Q. Mr. Smith, are the red blotches shown on this cross-section meant to indicate the precise location of gas?

A. No, sir.

Q. What do they indicate, if anything?

A. Typical locations of gas.

[fol. 4143] Q. I notice that one of those red colors goes into the Pre Cambrian and Granite on the left-hand side of this cross-section. Is there any gas to be found in the Granite?

A. Only in crevices.

Q. And that is what you meant by the red crayon?

A. Yes.

Q. You do not have any reference to any particular existing crevice at that point, do you?

A. No, sir.

Q. And that is true of your other colors, it is?

A. Yes, sir.

Q. You state at Page 9 of Exhibit 30, in the first paragraph that production from any of the horizons shown in Exhibit 22 has a direct effect on all other producing formations in the reservoir.

What do you mean by that statement, Mr. Smith?

A. I was trying to find the sentence to which you are referring.

Q. In the first paragraph on Page 9, the third sentence: "Necessarily, therefore, production from any of the horizons shown has a direct effect on all other producing formations in the reservoir."

Do you find that statement?

A. Yes, sir. I mean by that, that generally speaking, there is a connection between all producing formations, [fol. 4144] whether it be gas or oil which I have attempted to illustrate on Exhibit 22.

Q. Do you mean that the gas in this field is contained in a common reservoir?

A. Yes, sir.

Q. Now, this cross-section is not typical of the entire Panhandle Field, is it, Mr. Smith?

A. I would say it was.

Q. Isn't it typical only of the cross-section indicated by line A-A' in your Exhibit 21?

A. To a certain extent, that is true, but by the placing of this color on there, red for gas, green for oil and blue for water, I have attempted to show most of the conditions which exist in various parts of the field, in all parts of the field.

Q. But the structure such as you have shown in this cross-section is not the structure that you would encounter in other parts of the field?

A. No, you are right, there.

Q. Is oil being produced by this hypothetical well shown in this cross-section, Exhibit 22?

A. Yes, sir.

Q. Is this well typical of Panhandle Eastern's wells?

A. No, sir.

Q. Is my understanding correct that Panhandle East- [fol. 4145] ern's wells do not produce any oil, is that true?

A. That is true.

Q. Well, is your hypothetical well typical of the wells, generally, in the Panhandle Field?

A. Those which produce oil.

Q. Are there many of those in the Panhandle Field?

A. Yes.

Q. I am talking about the West Panhandle Field.

A. Yes, there are a great many.

Q. There are, but generally, they are located some distance from the Panhandle Eastern's acreage, are they not?

A. The closest wells of this type to Panhandle Eastern acreage are along the south line in the vicinity of Borger, Texas, in Hutchinson County, and northern Carson County.

Q. Now, the structures shown in this typical cross-section are not typical of Panhandle Eastern's acreage, are they?

A. Some Panhandle Eastern acreage occurs very close to a structure similar to this.

Q. However, the cross-section only pierces two or three of Panhandle Eastern's leases, is that not correct?

A. That is correct. However, as I stated before, this is not a detailed cross-section made from actual well logs, but is a generalized or typical cross-section, wherein we intend to show typical conditions existing throughout the [fol. 4146] Amarillo, Texas, Field in the Texas Panhandle.

Trial Examiner: Mr. Smith, you must have some schematic key for the showing of gas, oil and water in the 300 feet immediately above sea level. Would you explain that, referring again to Exhibit 22 for identification?

The Witness: That is the general relationship of oil, gas and water when they occur together, the water being found at the lowest elevation and oil immediately above that and gas above the oil.

Trial Examiner: Do the parallel horizontal lines disregard the structure?

The Witness: Yes, sir, generally.

Trial Examiner: They are meant, then, to indicate the sequence, the lowest being water, the next being oil and the final gas?

The Witness: Yes, sir, generally speaking, in Panhandle Field, water is found very close to sea level elevation, within 100 or 200 feet.

By Mr. Littman:

Q. Well, did you use this cross-section, Mr. Smith, for any purpose in connection with the estimate of gas reserves which you have submitted in Exhibit 30?

A. No, the chief purpose of the cross-section was to enlighten the Federal Power Commission as to the existing conditions in the Panhandle Field.

[fol. 4147] Q. Will you please turn to Page 11 of your testimony in Exhibit 30? In the first paragraph, the first line, you state that the initial pressure of the Panhandle gas field was approximately 430 pounds per square inch at the well head. A. Yes, sir.

Q. Corresponding to a pressure in the producing horizon of approximately 471 pounds per square inch, is that correct? A. Yes, sir.

Q. In that statement, do you refer to the entire Panhandle Field or to the West Panhandle Field?

A. The West Panhandle Field.

Q. Would you, for purposes of this record, tell us the line of demarcation between the West and the East Panhandle Field?

A. Yes, sir. I believe I have an exhibit here which shows that.

On Exhibit 31, the line of demarcation between the East and the West Panhandle Field occurs very close to the right hand edge of the map in central Gray County.

Q. Now, you referred to the initial pressure as being "approximately 430 pounds per square inch at the well head."

What degree of tolerance do you allow by using the term "approximately"? I take it that is not an exact figure.

[fol. 4148] A. That is true. I would say that is the average. However, some initial well head pressures were as high as 440 pounds, others were as low as 420 to 418 pounds.

Q. How accurate would you say this 430-pound figure is, as an average?

A. I believe that is a good average.

Q. And exact calculation, within 100 pounds, would you say, within 5 pounds, or what?

A. I would say it was within one pound of the average.

Q. Did you make this calculation of the average rock pressure? A. No.

Q. Where did you secure the figure?

A. I secured the figure by having studied well logs and examined Texas Railroad Commission Reports durring the past five years.

Q. Did you add the initial rock pressures for a number of wells in the field and then divide by the number of wells? A. No, sir.

Q. Would you give us an idea of how you arrived at it?

A. By observation that the earliest wells that were drilled averaged approximately 430 pounds. I mean by that, wells that were drilled prior to 1930. The well head pressure averaged about 430 pounds.

Q. When was the discovery well drilled in the Panhandle Field, do you recall?

[fol. 4149] A. The discovery well was drilled in 1918 in northern Potter County.

Q. Well, Mr. Smith, I am still not clear as to the precise method whereby you arrive at this figure of 430 pounds per square inch which you have stated is a precise figure with a tolerance of not more than one pound one way or the other.

Is there anything that you could do to clear me up on that? In other words, you say it was not calculated by you and I am still at a loss to know how you arrived at it?

A. Well, let's assume, for instance, that prior to 1930 there [was], say, 100 wells producing gas similar to those connected to Panhandle Eastern Company pipe line.

The majority of these wells were drilled prior to the great withdrawals that the field is subjected to now. Merely by observing the initial shut-in well head pressure, I noted that they ranged from points equally on either side of 430 pounds, and, consequently, selected 430 pounds as the average.

Q. Well, do you have such a list of wells that were producing prior to 1930?

A. I did not say producing. I say, were drilled prior.

Q. Were drilled prior to 1930, I am sorry.

A. I could obtain a list of that kind. I have records which would supply a list of that kind in Kansas City.

Q. You did have such a list when you calculated the [fol. 4150] 430 pounds, did you not? A. Yes, sir.

Q. How many wells were on that list?

A. I do not remember.

Q. Can you give us a general idea?

A. There may have been as many as 200.

Q. But you did not total the initial pressures of those wells and divide by the number of wells, did you, to get a calculated figure?

A. I have arrived at calculations of that. I have had the idea that 430 pounds was the initial pressure for so long, I do not know how long.

* * * * * * * *

[fol. 4151] By Mr. Littman:

Q. Did you select this figure 430 pounds because it is accepted in the industry, or did you calculate it yourself? Let's get at it that way.

A. I selected it partially because it is accepted in the industry, but also partially because of the knowledge I have myself.

Q. You have Exhibit 23, the rock pressure map of 1932?

A. Yes.

Q. To what use did you put this map in arriving at your estimate of gas reserves of Panhandle Eastern in the Panhandle Field?

A. This is one of a series of rock pressure maps which tend to show the rock pressure conditions in the Texas Panhandle Field since the early days of the field.

Q. You say, it tends to show the rock pressure. What do you mean by that? Doesn't it show it?

[fol. 4152] A. Which shows the rock pressures.

Q. Did you prepare this map? A. No, sir.

Q. Who did?

A. It was copied from a map we have in our files, as stated in the testimony.

Q. By a map in your files, you mean the files of Panhandle Eastern Pipe Line Company? A. Yes, sir.

Q. You do not know whose handiwork it is? A. No, sir.

Q. Well, I take it, then, that you cannot personally

vouch for the accuracy of the information shown on this map. A. That is true.

Q. Have you ever used this map for the purpose of obtaining a 1932 weighted average pressure of the Panhandle Field? A. No, sir.

Mr. Littman: Before leaving this Exhibit No. 23, if your Honor please, I would like to, as we go along, note an objection to the Exhibit 23 and also to the previous Exhibit No. 22, the Panhandle Cross-Section.

Trial Examiner: Do you wish to develop your objection fully later, or do you wish to do so now?

Mr. Littman: Perhaps I can state very briefly the ground of my objection.

[fol. 4153] With respect to Exhibit 22, the Panhandle cross-section, the witness testified that he did not utilize this cross-section in arriving at his estimate of gas reserves, that the cross-section was not a true cross-section, but was purely a typical cross-section; that even the well shown thereon was a hypothetical well, and that the coloring on the map did not indicate the exact locations of gas, but was shown thereon purely for purposes of indicating where gas might or might not be.

The testimony further shows that oil was being produced by this so-called typical well, and the testimony is clear that Panhandle Eastern's wells do not produce any oil.

The testimony further shows that the cross-section is not typical, that is, the structural portions of the cross-section are not typical of Panhandle Eastern's acreage nor of the entire field, but it is typical only of a line designated as A and A' which pierces only one or two or three leaseholds of Panhandle Eastern.

In short, the cross-section is merely a very pretty picture that might be used in a class room; and I am not at all challenging the sincerity or the earnestness with which this witness is presenting his testimony.

I merely am stating that it has no probative value in this proceeding and would serve no useful purpose, other than to encumber the record.

Now, with respect to the next exhibit, namely, Exhibit [fol. 4154] No. 23, the rock pressure map—1932, this map was not used by the witness in arriving at his estimate of reserves.

It is of unknown origin. This witness does not know who did the job and, so far as we know, no one else knows who gave birth to it.

Mr. Culton: If you do not care about 1932 being in, we have no objection to 1932 pressure map being stricken. It was put in there for just such information as it would give the Commission.

The Witness: There is one thing that has been overlooked, that I want to bring to your attention, that is, all of these rock pressure maps are of both the Hugoton Field and the Panhandle Field.

Mr. Culton: We have no objection to Exhibit 23 for 1932 being stricken so far as the Panhandle is concerned.

We thought the Commission might be interested in seeing the picture that existed at that time.

Mr. Littman: Those, briefly stated, are the grounds for the objection, if your Honor please.

Trial Examiner: Does the statement of the witness that this also includes the Hugoton Field affect the nature of your objection at this time?

Mr. Littman: It does not, if your Honor please, for the reason that the author of this exhibit is unknown and this witness cannot vouch for the accuracy of the information [fol. 4155] contained thereon.

Moreover, it purports to show a situation which prevailed something like nine years ago.

The Witness: Mr. Littman, when I said the author was unknown, that applied only to the Texas portion of it.

Mr. Littman: I am sorry.

Mr. Culton: That is all I had reference to also. There will be plenty of proof as to the Hugoton Field.

By Mr. Littman:

Q. Do you happen to know who the author is of the portion of the map which discloses the Hugoton Field?

A. Yes, sir, it was prepared under my supervision.

Q. That part was? A. Yes.

Q. I see. But you are not testifying here with respect to the Hugoton Field, are you? A. No, sir.

Q. Do you know whether Mr. Bartle made any use of this map in arriving at his estimate?

A. I am quite sure he did.

Q. Well, what is the basis of your information with respect to the rock pressures in 1932 in the Hugoton Field?

A. The rock pressure map of the Hugoton Field which appears on Exhibit 23 was prepared from actual tests made on wells in the Hugoton Field.

[fol. 4156] Q. Was it prepared by you.

A. Under my direction.

Q. Now, you refer to wells. Where did you secure the list of wells that you used for this purpose?

A. From records which we have on individual wells in the Panhandle Eastern offices in Kansas City.

Q. Are those the wells of Panhandle Eastern Pipe Line Company, or are they the wells in the entire field?

A. The entire field.

Q. And those are on file in the offices of the company?

A. Yes, sir. I have a great deal of that data in my work sheets.

Mr. Culton: Could you obtain that information as to Panhandle in 1932?

The Witness: Yes, sir.

Mr. Culton: Did you obtain it?

The Witness: I did not. A lot of our work was done as it was done due to the time element which we had to combat, and we could probably have made our exhibits much more elaborate and much more detailed, had we had more time for preparing them.

By Mr. Littman:

Q. And you would have done so?

A. Yes, sir, gladly.

. . . . . .

[fol. 4158] By Mr. Littman:

Q. Who prepared this map identified as Exhibit No. 24?

A. It was prepared under my direction from a Railroad Commission map of Texas.

Q. What part of it did you prepare and what part did the Railroad Commission of Texas prepare?

A. It is merely a copy of the Railroad Commission's map.

Q. The same situation is true with respect to Exhibit 25, rock pressure map of 1939, is it not? A. Yes, sir.

Q. And the same situation is true with respect to Exhibit 26, which is the rock pressure map for 1940?

A. That is true in all cases with Texas but not Hugoton with the exception of 1941, which was prepared, as far as we could from data that was available at that time from actual tests made by Panhandle Eastern Pipe Line Company.

Q. The 1941 rock pressure map was prepared by you?

A. Yes, sir.

Q. And all of the Hugoton data was prepared by you?

A. That is true.

Q. But so far as the 1938, 1939 and 1940 Panhandle Field rock pressures, those are not yours?

[fol. 4159] A. Those are not mine.

Q. Did you use Exhibits 24, 25 and 26, which are the rock pressure maps for 1938, 1939 and 1940, for the preparation of your estimate in this proceeding?

A. Not directly. As I stated before, they were a series of maps which were prepared to show the isobaric pattern in the Texas Panhandle Field principally because it is a progressive picture and seemed to us to be very enlightening.

Q. Well, you said you did not use these rock pressures directly. What do you mean by that? Did you use these rock pressures indirectly in estimating your reserves?

A. The data on those maps were considered, yes.

Q. By you? A. Yes, sir.

Q. How did they enter into your consideration in estimating gas reserves?

A. I have studied the decline in rock pressure for a number of years and they influenced the method that I used in arriving at the reserve figures in my testimony.

I have studied a great many other things which also entered into the method that I used.

As a matter of fact, the more that you can learn about any field, the more accurately you can estimate the reserves of that field, whether it be rock pressure, overflow, samples [fol. 4160] or what not. They all have their influence in the final judgment of the reserves estimated to be contained in the gas field.

Q. You have reference now, do you, to background knowledge rather than a specific application?

A. That is true. I think that background knowledge is important.

Q. In other words, if I correctly understand your testimony, you did not use these rock pressure maps for 1938, 1939 and 1940, to-wit, Exhibits 24, 25 and 26, respectively, for purposes of calculating the reserves which you estimated, but as a more or less general background knowledge, is that correct? A. That is true.

Q. Now, did you use the rock pressures shown in Exhibit 27 for the year 1941 for purposes of making a calculation of reserves, or did you not?

A. No, it was not used either, directly.

Q. But it was also background knowledge similar to that which you stated for the previous three years?

A. Yes, we are still talking about the Amarillo Field, not the Hugoton Field.

Q. Yes. You did not make any estimate for the Hugoton Field. A. That is true.

[fol. 4161] Q. For the purposes of this proceeding?

A. That is true.

Q. Could you have used the data shown on rock pressure maps, Exhibits 24, 25 and 26 and 27 for purposes of estimating the reserves of the Texas Panhandle Field by the rock pressure decline method? Would they be suitable for that purpose?

A. I do not think so.

Q. Why, Mr. Smith?

A. Because I have experimented with that method and I found that it gave a figure which did not appear to be reasonable.

Q. You mean by the use of the isobars shown on these exhibits which I have just named? A. Yes, sir.

Q. Will you please give me the intervals between the isobars on each of these maps?

A. The isobaric intervals on these maps is 50 pounds.

Q. Do you think that may explain why the information did not prove to be accurate, the fact that the intervals were that far apart? A. No, I do not.

Q. How do you account for the so-called unreasonable figure that you secured by using the rock pressure decline method based on the information contained in these rock pressure maps?

[fol. 4162] A. The chief reason is you cannot arrive at an average present rock pressure.

Q. Can you tell us why you cannot do that?

A. Because it must be a weighted figure, and it is almost impossible to know how to weight it.

Q. Why? What is the reason for that?

A. A weighted rock pressure figure is weighted with respect to acreage. That is, the rock pressure existing in each of these bands is multiplied by the number of acres existing in those bands.

Q. Now, you are referring to the bands on your maps, Exhibits 24, 25, 26 and 27? A. That is true.

Q. Pardon the interruption.

A. Even though you have a great many shut-in well head pressures within those bands, it is still impossible to know just how many acres each one of those wells influence.

For that reason, it is impossible to arrive at an exact figure of the number of acres to use in weighting.

* * * * * * * *

[fol. 4165] C. H. Hinton a witness, having been previously sworn, resumed the stand and testified further as follows:

By Mr. Goodman:

Q. Mr. Hinton, you have stated that planning for a period ahead is a necessary condition in the natural gas business, is that right? A. That is correct.

Q. And you are the man who does a certain element of planning about production, is that so?

A. That is correct.

Q. Is that part of your regular routine? A. It is.

Q. And referring to your regular routine, just how do you go about developing your plans? I mean, give me the routine of it.

A. All right. The first thing is to determine what amount of gas is required for the main line peak day load. The next thing is to determine just what the field condi-
[fol. 4166] tions are. That is—

Q. (Interposing) Let's stop here at the first thing, Mr. Hinton. The determination of the main line peak load is something furnished to you by some company official, is that right?

A. Mr. Morton usually furnishes that information.

Q. You say he usually furnishes you that information?

A. Yes.

Q. And he furnishes that to you not as a matter of Morton personally, but as a part of an established routine, isn't that so? A. That is correct, yes.

. . . . . .

Mr. Morton usually takes the present load and then what new contracts are added to the present load, are added thereto and that is furnished in September or the latter part of August for the start of the planning of the next year's budget.

Q. So that you begin with a regular routine which consists of adding the contract requirements for the ensuing year to the existing contract requirements, and that is furnished to you by Mr. Morton and is a report made of that to the officials of the concern?

[fol. 4167] A. Yes, sir.

. . . . . .

Now, the sales are then converted over to the production pressure base, the main line capacity being calculated on 30 inches mercury saturated is about 14.73 pounds and our production pressure base is 16.4 pounds.

Then, we add to the sales the line loss that has been determined through the several years operation and the fuel required to operate the compressor stations on the main line, and that is what we term as the Liberal input, the requirement which is the sales plus line loss plus fuel requirement.

Q. Yes.

Now, you then prepare your estimates concerning the cost of producing the gas necessary to supply this demand, do you not? A. That is true.

Q. Mr. Morton not only gives you the peak demand, but he gives you the volume?

A. That is right, annual.

Q. The annual volume? A. Yes.

. . . . . .

[fol. 4169] Q. Do you not, in conjunction with the management then, maintain a certain plan or sketch of the probable future operations? A. Yes, we do.

. . . . . .

Q. It has some name, you would have to have some way of identifying it.

A. It is mostly verbal, Mr. Goodman. That is, in a natural gas company, there are many days that the people concerned about the development will get together and talk the matter over, and if it looks as though some information is lacking that should be worked up, why, then, it is worked up.

I do not believe it has any definite name.

Q. I see. So that, as a matter of fact, you cannot show that there is committed to writing any definite plan for the expansion of output beyond the requirements of the next ensuing year, is that right?

A. Up to this year.

. . . . . .

[fol. 4170] Q. Well, but I am interested, Mr. Hinton, solely in your regular routines, wholly apart from any rate case.

So far as your regular routines go, you do not have committed to paper any plan of expansion of output beyond the year 1942?

. . . . . .

A. As far as I am concerned, our future is usually in the form of a huddle, you might say. We all get together and talk about what we may expect in the next two or three years.

Q. Has that get-together taken place during this year?

A. Yes, it has taken place every year, and many times a year probably.

. . . . . .

[fol. 4171] Q. Now, when you speak of your load factor, you have in mind the relationship of your average daily delivery to the peak day, is that right?

A. Yes, that is right.

Q. From what you have said, am I correct, then, in understanding that your future forecasts, as shown in Exhibit 43 and testified to in Exhibit 42, are matters expressly prepared for this case and are not part of the company routine?

A. I believe that would be right, Mr. Goodman. I think that has been one thing that this case has caused us to do that we should not have done heretofore, and that is to make just this kind of study, and the study is just the same for this case as it would be for our future picture, and this will probably be followed very closely all the way through.

Q. Yes, but that is a matter for the management, isn't that so?

A. Well, the management has looked over this plan and they picked a lot of bugs out of it. It has been changed around. This is not the original plan we started off with. We did not make just one study on this and say, "That is [fol. 4172] that." We spent hours on this planning, how we could develop more efficiently, and get the gas into Liberal at a lower cost.

Q. And by "we", to what men besides yourself do you refer?

A. Mr. Pope, Mr. Neuner, Mr. Burnham, and Mr. Creveling and Mr. Morton and Mr. Smith, the geologist.

Q. For the year 1942, you have made a separate estimate of the production requirements and costs wholly apart from Exhibits 42 and 43 here, have you not?

A. Yes, sir.

Q. And what became of that estimate?

A. At this time, it is probably being whipped into shape to present at a budget meeting.

. . . . . .

[fol. 4173] Q. In connection with your studies, Exhibits 42 and 43, here, have you developed unit costs paralleling those studies?

A. Not quite paralleling, because we have found, in practically every case, that our present budget figure exceeds the figure which is used in this study here.

[fol. 4174] That is due to an increase in material costs. It is due to increasing labor costs, and I believe that, in every case that I can think of, with one exception, that those costs have been increased.

That one exception is the well which we are drilling in Texas County, Oklahoma, at this time. Due to the fact that it is very hard to get pipe at this time, we are leaving the line out of that well, and the cost of that well has been reduced by that amount.

. . . . . .

[fol. 4175] Q. On the first paragraph of Page 4.

"The unit costs for producing and gathering the gas will be substantially higher than those heretofore existing."

That is concluding the first paragraph on Page 4.

A. That is a true statement.

Q. Well, now, I did not ask you that. I asked you if you have produced those unit costs.

A. Showing an increased cost per M. c. f?

Q. That is right.

A. This does not refer to any from one month to the next. It is an over all picture—

Q. (Interposing) I did not ask you that question. You had better read the question.

. . . . . .

[fol. 4176] The Witness: As the pressure declines in the fields, it takes more horsepower to handle the same amount of gas. It requires more wells to get the same amount of gas.

Therefore, there is a decided increase in the cost per M.c.f., due to the fact that there are more extensive operations and more equipment required, and that is what this

has in mind here, when I say that the gathering of gas will be substantially higher than those heretofore existing.

* * * * * * * *

[fol. 4187] Rufus M. Smith a witness, having been previously duly sworn, resumed the stand and testified further as follows:

Cross-Examination (Continued).

By Mr. Littman:

Q. Mr. Smith, at the close of yesterday's session, we were discussing your rock pressure maps for the years 1938, 1939, 1940 and 1941, Exhibits 24, 25, 26 and 27 for Identification.

[fol. 4188] I believe you testified that these maps were not suitable for the purpose of estimating the reserves of the Texas Panhandle Field by the rock pressure decline method, is that correct?

A. That is true.

Q. However, I believe you stated that you did make an estimate of the reserves in the Texas Panhandle Field by that method?

Mr. Culton: He did not make such a statement.

The Witness: I said I attempted to make that.

By Mr. Littman:

Q. Well, what do you mean by "attempted"?

There seems to be some difficulty here in the definition of terms.

A. In order to make a reserve study of a field by the production per pound of drop method, it is necessary to have an equilibrium pressure at the time the study is made, to compare with the initial pressure.

In my opinion, it is impossible and impractical from a practical standpoint, to obtain an equilibrium pressure of the Panhandle Field.

The figures that I used are those obtained from Railroad Commission reports, which are inaccurate by reason of the method that they used in obtaining them.

Q. Can you give us the reference to the data of the [fol. 4189] Texas Railroad Commission which you used that you just referred to as being inaccurate?

A. It is found in the annual report on the Panhandle oil and gas field of July, 1940, issued by the Railroad Commission of Texas.

Q. Now, will you state what you consider inaccurate about the method used by that commission, and stated in that report with respect to ascertaining the present—you used the term—

A. (Interposing) Equilibrium.

Q. (Continuing)—equilibrium rock pressure. Is that another term for weighted rock pressure?

A. That is true, in a way. By that I mean, they attempt to arrive at approximately the equilibrium pressure by calculating a weighted average rock pressure.

Q. I see.

Now, will you tell us what you deem to be inaccurate about the method used?

A. The method used—I do not believe it so states in here—

Q. (Interposing) "In here,"—by "in here", you are referring to the annual report?

A. In this 1940 Railroad Commission report on the Panhandle oil and gas field; but by investigation I have found that their average weighted rock pressures are ob- [fol. 4190] tained by referring to the various pressure bands on their annual rock pressure map, multiplying the area of each of the bands times the average pressure existing within those bands, and dividing by the total area of the several areas used.

Q. Now, what do you consider inaccurate about that, Mr. Smith?

A. It is a rough method. It is very crude, I might say.

Q. What is crude about it, and what is rough about it?

A. Well, the pressures of the wells existing in those bands vary from one side of the band to the other within a range of 50 pounds, so, obviously, if you select an average pressure it will be half way between the two, and that is assuming a great deal.

Q. Well, the 50 pound isobaric intervals to which you have just referred is the same interval that you used in

your rock pressure maps, Exhibits 24, 25, 26 and 27, is it not? A. That is true.

Q. And, in your judgment as a geologist, that kind of an interval cannot be relied upon for purposes of making an accurate determination of the weighted average rock pressure in a field?

A. Yes, that is true.

Q. What would you say about the use of a 10-pound isobaric interval?

A. That would come closer to solving it, but still would [fol. 4191] not solve the problem.

Q. Would it come very close to solving the problem?

A. No, I do not think it would be sufficiently close to get a reasonable figure.

Q. Well, what would, in your judgment, come close to getting a reasonable figure?

A. I do not believe that any of the methods that have been used are very accurate, including my own.

Q. Well, you are stating, I take it, that the science of geology is not an exact science?

A. I believe we made that statement yesterday, Mr. Littman.

Q. Off the record, however.

Have you ever heard of isobaric intervals being used that were less than 10 pounds?

A. I do not believe so.

Q. In other words, 10 pounds is just about as close an interval as is ever used by geologists, generally?

A. Unless you would use a very large-scale map, it would be impractical to use a smaller than a 10-pound interval.

Q. Then, I gather from your testimony, Mr. Smith, that, in your opinion, no reasonable estimate can be made under existing methods of the weighted average rock-pressures in the Panhandle Field of Texas?

A. I would like to answer that question this way:

[fol. 4192] That, in my opinion, the only way to find the correct equilibrium pressure would be an impractical project, that of shutting in the entire field, all the wells of the field, for a great length of time, until all wells had approximately the same well head pressure; then, you would have the equilibrium pressure of the field.

Q. How long a period would all these wells have to be shut in, in order to get such a reading?

A. I say it is impractical. It might take five or ten years to stabilize throughout the entire field.

Q. Well, the effect of doing what you suggest as impractical and theoretical, to-wit, shutting in the wells for a number of years, would all have the effect of giving a higher over-all rock pressure reading, would it not, than readings that would be secured by, let us say, a three-day shut in?

A. I do not know whether it would be higher than the weighted pressure or lower than the weighted pressure. It would be different from the calculated weighted pressure.

Q. Well, how long are wells ordinarily shut in before rock pressure readings are taken, generally?

A. Seventy-two hours.

Q. And when a reading is taken, at the end of 24 hours, let us say, it is less than it is at 72, is that right?

A. That is true.

Q. And a reading taken at 48 hours is higher than the [fol. 4193] one taken at 24, but less than the one at 72, is that right?

A. That is true.

Q. So in all probability, if you had the well shut in longer than 72 hours, you would still have a higher rock pressure reading, wouldn't you?

A. Except for one thing. On one side of the field, the pressure is very low. On the other side of the field, it is much higher. If those

Q. (Interposing) What field?

A. On the west sweet field, or rather the west field, so consequently, if it be stabilized, the one would raise and the other would lower, in order too reach a common pressure throughout the field, and the equilibrium pressure would be some place between the maximum and the minimum.

Q. Well, your maps which show the rock pressures for the years 1938, 1939, 1940 and 1941, namely, Exhibits 24, 25, 26 and 27, respectively, are maps which you do not consider accurate for the purposes of determining any weighted average rock pressure?

A. They are merely the best information available, but not sufficiently accurate to determine an average weighted rock pressure.

Q. Well, you then did not use the rock pressure decline methods? A. No, sir.

[fol. 4194] Q. But you did speak yesterday about having tried it and having secured what you called a "not reasonable figure."

What figure did you secure that you considered to be unreasonable?

A. I do not remember just offhand exactly what the figure was.

Q. Was it an estimate of the original gas content per acre?

A. I have attempted to use that method several times but, from the annual Texas Railroad Commission reports on the Panhandle Field, I find that one year there is one production per pound drop in rock pressure, the next year an entirely different production per pound drop in rock pressure.

There is no consistency in the production per pound drop as stated in their reports.

Q. And that result was predicated upon a 50-pound isobaric interval?

A. That is true.

Q. And, in your opinion, it cannot be used for purposes of determining gas reserves?

A. Accurately.

Q. Accurately.

Now, to what do you attribute this so-called incongruous result of having a decelerating rate of production per pound of rock pressure decline, Mr. Smith, to the inaccura-[fol. 4195] cies that result from the use and application of the Texas Railroad Commission's data, or what?

A. That, together with some other factors.

Q. Will you name the other factors, please?

A. Some of the other factors are variations in the character of the reservoir, the fact that the gas is being withdrawn from Dolomitic beds, from pure Limestone

beds, from Granite Wash formations, as well as from crevices in Granite Wash, as shown on the cross-section; the fact there is oil production there; the fact that water is encroaching in some portions of the field; the fact that the field is not being withdrawn equally by all producers.

There are a number of other factors. I do not recall any more, right now.

Well, did you use the so-called porosity method of estimating the reserves in the Panhandle Field?

A. Yes, sir.

Q. That method also has some other names, doesn't it, such as volumetric method?

A. Volumetric.

Q. Let us have all the of the synonyms, so we will understand each other in this cross-examination.

A. Porosity, thickness of pay method, sand thickness porosity method, I believe it is also called.

Q. Well, without going into the details of that method [fol. 4196] at this time, you must, in order to make a determination of the reserves in a gas field by the porosity method, also have the weighted average pressure in the field, don't you?

Mr. Culton: You say, the weighted average pressure of the field?

Mr. Littman: Of the gas field, yes, sir.

The Witness: No, only the weighted average pressure of the area to be considered.

By Mr. Littman:

Q. What is the difference? Suppose I wanted to ascertain the reserves in a whole gas field. Wouldn't I have to have the weighted average pressure of the entire field under your method?

A. That is true.

Q. And I would have to have the same weighted average pressure under the rock pressure decline method, would I not? A. Yes.

Q. Inasmuch as you say that these pressures cannot accurately be determined in any event—

A. (Interposing) I beg your pardon. You do not have to have the present weighted average pressure under the method I used.

Q. What do you have to have?

A. You have to have the initial pressure only.

Q. You can determine it also by having the present [fol. 4197] weighted pressure, can't you?

A. That is not the method I used, however.

Q. You used the initial pressure?

A. I used the initial pressure only.

Q. Weighted initial pressure?

A. No.

Q. In order to make it accurate, you should have a weighted initial pressure, should you not?

A. Not necessarily the weighted average. The initial pressure should be constant throughout the field without any variations whatsoever.

Q. It should be, but it isn't?

A. That is true, it was not.

Q. No field ever was, was it?

A. None that I have had any contact with.

Q. Then, you do have to have a pressure, either initial or present, in order to compute by any method, isn't that true?

A. That is true, but it is much easier to obtain the initial pressure, whether you call it weighted average or merely initial pressure, than it is to obtain the present weighted average.

Q. I believe you stated yesterday that you had a list of wells from which you made a determination of the original pressures in the field, did you not?

[fol. 4198] A. Yes.

Q. And you said there was considerable variation, did you not?

A. I said there was a variation of possibly five to ten pounds, either way, from the 430 pounds. However, in the present pressure, there is much greater variance than five or ten pounds.

As a matter of fact, there is probably 250 pounds variations between the present pressures.

Q. Are you now speaking of the west Texas Field, or the entire field?

Mr. Culton: You mean West Panhandle Field.

By Mr. Littman:

Q. West Panhandle Field.

A. West Panhandle Field.

Q. Well, you did not, in any event, make a weighted average initial rock pressure determination, did you?

A. You might call it that, even though it might have been done mentally, it was an average.

Q. Well, you are talking about getting accurate. What would you do if you wanted to get an accurate original weighted average rock pressure? How would you go about it?

A. Since I was not there at the time, and was unable to take any of the initial pressures or see them taken with dead weight gauges or spring gauges, I would attempt to [fol. 4199] get articles that had been written on it by men who were there at the time.

I would value their judgment. I would get whatever other statistics were available, including logs of wells which were drilled at that time which contained the initial rock pressure, and from those data, to the best of my ability, determine the initial rock pressure of that field.

Q. You skipped pretty fast over the last part of that. You said from those data you would get it. What would you do with those data?

A. I would take the rock pressure reports for those data, add them up, divide by the number of tests and determine the initial average rock pressure.

. . . . . .

Q. Wouldn't you weight those pressures as against the territory or acres?

A. It would not be necessary, if there had been no gas withdrawn.

Q. Even though there was a variation in initial rock pressures?

A. Absolutely. Those variations would probably be due principally to the inaccuracy of the apparatus used in getting the test.

[fol. 4200] Q. These readings that established the initial rock pressure of the field were taken over a period of years, weren't they?

A. A short period of years.

Q. How many years?

A. Possibly three or four.

Q. And gas had been withdrawn from time to time?

A. In very small quantities up to that time.

Q. So that the rock pressure reading, obviously, on each new well that was drilled did not reflect the virgin pressure of the entire field, did it, other than perhaps the first one, or is that not correct?

A. I do not think the amount of gas that had been withdrawn from the field in those first three or four years, considering the fact that this is such a large reservoir, would make even one pound difference in the rock pressure.

Q. We will come back to your method a little later. I had not intended to discuss it at this point, but the fact is that you did have to use an initial rock pressure?

A. That is right.

Q. As one of the elements in calculating the reserves in the Panhandle Field?

A. That is true.

Q. Now, do you have Exhibit No. 27 before you, which is the rock pressure map for 1941?

[fol. 4201] A. I believe the exhibits are on the floor there that I used yesterday, Mr. Littman.

(The document was handed the witness.)

Mr. Culton: Which exhibit was that you mentioned?

Mr. Littman: Exhibit 27.

By Mr. Littman:

Q. Now, you show certain rock pressures in the Panhandle Field, do you not, on that map?

A. Yes, sir.

Q. Do you show the pressures for the entire portion of the Panhandle Field, including the portions in which Panhandle Eastern's acreage is located?

A. This 1941 map is incomplete, as far as the whole Panhandle Field is concerned. At the time it was made, we had only tests on the wells connected to Panhandle Eastern Pipe Line Company.

Consequently, we put as much information on here as was available at the time.

Q. In other words, the map is incomplete in that it fails to show the rock pressures on a substantial part of Panhandle Eastern's acreage, is that correct?

A. Yes, that is correct.

Q. What is the porosity of the pay sand under the acreage controlled by Panhandle Eastern?

A. There is a great variation in those pay sands you [fol. 4202] have under Panhandle Eastern's acreage, as well as under the entire field.

Q. What is the average pay thickness under Panhandle Eastern's acreage?

A. The average pay thickness is between 70 and 80 feet.

Q. And what is the average over the field, over the entire West Panhandle Field? A. Seventy feet.

Q. In other words, Panhandle Eastern's acreage, in your opinion, has a thicker pay sand, does it not?

A. Slightly, on the average.

Q. Now, that is the over-all average, that you have given for the Panhandle Eastern acreage, is it not?

A. I gave two figures, Mr. Littman, one of 70 feet and one slightly over 70 feet, which I indicated was my estimate of the thickness of pay sand in the Panhandle Eastern acreage.

Q. I believe you said from 70 to 80, is that right?

A. Yes, I did.

Q. You have, in your Exhibit 30, divided Panhandle Eastern's acreage into Class 1 and Class 2, have you not?

A. Yes, sir.

Q. By the way, when I speak of Panhandle Eastern's acreage, I am going to, at all times, refer to the acreage which Panhandle Eastern has under lease, as well as that which it controls by gas purchase contracts.

[fol. 4203] A. I assumed that.

Q. That is, unless otherwise stated.

Now, what is the average pay thickness under the Class 1 acreage owned and controlled by Panhandle Eastern?

A. I would say between 70 and 80 feet.

Q. And what is the average of the Class 2?

A. I do not know exactly. It would be something somewhat less than 70 feet.

Q. Can you tell us, approximately, how much less?

A. I can guess at it.

Q. I want your best judgment, however. If it is just merely a guess, I do not think it would help the record any.

A. I would say, approximately 45 feet, in my opinion.

Q. Now, how did you arrive at this 70 foot figure and this 45 foot figure?

A. I arrived at the 70, slightly in excess of this 70 foot figure, by using all the logs of the wells of Panhandle Eastern Pipe Line Company which contained sufficient data to determine the pay thickness, added those thicknesses and divided by the number of wells, the answer being over 70 feet.

Q. How many wells did you use in making this calculation, and state whether or not a list of these wells is shown in your Exhibit 30?

A. No, a list is not shown in Exhibit 30.

Q. Can you state how many wells you used?

[fol. 4204] A. I believe there was right about 40 wells that we used, that had sufficient data to accurately determine the pay thickness.

* * * * * * * *

Q. I believe you stated that you used 40 wells for the purpose of determining the average pay thickness in the Panhandle Eastern acreage in the Panhandle Field?

A. Approximately. There may have been more than that, but I believe it was about 40.

Q. And you are going to furnish us with the list?

A. Yes, sir.

Q. You will give us the farm and well number, the county, location and the pay thickness and also any other identifying features that you can supply, will you not?

A. Yes, sir.

Q. Now, were those all Panhandle Eastern's own wells [fol. 4205] or were those 40-odd wells the wells of others?

A. Some of them were gas purchase wells.

Q. But all of them are—

A. (Interposing) Connected to Panhandle Eastern Pipe Line.

Q. Very well. Now, you have a list of wells shown in Schedule 1 of Exhibit 30, have you not? A. Yes, sir.

Q. I see 34 wells. Did you use these wells for the purpose of determining the average pay thickness?

A. Some of these wells.

Q. Can you designate in the record, by line number, the wells of Schedule 1 that you used in your determination, that is, which of these wells are included in the list of 40?

A. One, 2 and 3; Lines 14, 15; Lines 26, 28.

Q. Does that complete it?

A. Yes, that is all.

Q. In other words, you have pointed to all of the wells shown in Schedule 1 which are connected to Panhandle Eastern's lines, have you not? A. Yes, sir.

Q. Now, how many acres of leases are owned and controlled by Panhandle Eastern Pipe Line Company?

Mr. Culton: You mean, in the Panhandle Field?

[fol. 4206] By Mr. Littman:

Q. In the Panhandle Field, yes.

A. 65,429, as shown on Schedule 2 of Exhibit 30.

Q. The approximately 40 wells that you had would average about one well for every 1,600 acres, would it not, approximately?

A. That is hardly the way to arrive at a figure of that kind, since some of the wells used, or rather, some of this acreage, would not be applicable to those 40 wells.

Q. How much of the acreage of this 65,000 acres would not be applicable to these 40 wells?

A. Approximately 40,000.

Q. 40,000 is applicable? A. Is not applicable.

Q. In other words, do I understand that 40 wells that you used were used by you to determine the average pay thickness for approximately 15,000 acres?

A. The difference between 65,000 and 40,000 is 25,000.

Q. I am sorry, it is 25,000. Is my understanding correct, using 25,000?

A. I do not know just exactly what you are leading up to, but the reason I only used 40 wells instead of all of the wells connected to the pipe line was due to the fact that information was not available to accurately determine the pay thickness of the remainder of the wells.

[fol. 4207] Q. Well, I am simply trying to understand what you did, Mr. Smith. You straighten me out if I am wrong.

My understanding of your testimony is that the 40 wells that you did utilize for purposes of determining average pay thickness were applicable to approximately 25,000 acres in the Panhandle Field. Is that correct?

A. Directly, but were used as determining the average pay thickness under the entire 65,429 acres.

Q. Then, doesn't it follow, that, on the average, you have one well determining the situation for approximately 1,600 acres on the average?

A. If you divide 40 into 65,429, I think you would get approximately that figure.

Q. Well, you do not think it is proper to draw that kind of conclusion? A. No, I do not.

Q. Well, let's look at it another way. You say that the 40 wells are applicable to approximately 25,000 acres.

A. That is true.

Q. How did you determine the average pay thickness on the remaining 40,000 acres of Panhandle Eastern's reserves?

A. I used that figure to apply to all 65,429 acres because that was the best information that I could obtain from the well logs that I had.

Q. Well, how many wells does Panhandle Eastern and [fol. 4208] its gas vendors have in the Panhandle Field?

A. 110.

Q. Now, you had approximately 70 more wells from which to secure data, did you not? A. Yes, sir.

Q. And why didn't you secure data with respect to pay thickness from those wells?

A. Because they were drilled early in the history of the field and accurate data was not kept on a great many of them. In addition to that, very often when a large amount of gas is encountered, it is almost impossible to determine the thickness of pay from which that great volume is coming.

Q. Will you explain why that is true?

A. The reason being that the samples from those formations are blown out of the hole and cannot be caught and examined, whereas, when a small amount of gas is blowing

from a hole, usually the samples will accumulate in the bottom of the hole and can be brought to the surface by running the bailer down the hole, collected and examined.

Q. Will you tell us what a bailer is?

A. A bailer is a long tube made of pipe with a valve in the bottom.

Q. Now, where do you go to get the data as to pay thickness, from the well log?

A. From the samples, together with the driller's log. [fol. 4209] Q. Well, now, the driller keeps a log as he drills, does he not? A. That is true.

Q. And he makes a record of each strata and the thickness of each?

A. As near as he can determine it.

Q. And it is quite difficult, is it not, to make an accurate determination? A. That is true.

Q. What difficulties or troubles does a driller encounter with respect to determining the thickness of these strata encountered? How does he know when he hits one or the other?

A. He determines the increase in open flow by use of a pitot tube. This pitot tube is made of a piece of pipe, one end of which is bent in a semicircle. It is so constructed that the outer end of the semicircle falls at about the center of the casing from which the gas is flowing. The other end of this piece of pipe is attached to a piece of rubber tubing.

The other end of the piece of rubber tubing is attached to a manometer. This manometer is a "U"-tube containing mercury. The force of the gas on the small section of bent end of the pitot tube changes the level of the column of mercury in the manometer.

[fol. 4210] Behind this "U"-tube are two scales, one on each arm of the "U"-tube. There can be determined the amount of rise in one column of the mercury and the amount of fall in the other. The sum of the two is the difference between the levels of the mercury which is usually expressed in inches.

A table is referred to then to determine a multiplier. This multiplier is used to multiply times the square of the diameter of the casing from which the gas is coming.

After the multiplier and the square of the diameter are multiplied together, the open flow is determined.

Q. Well, that gives you the open flow. How do you relate that to the pay thickness? Proceed.

A. That is done from time to time, and increases in the volume of gas coming from the casing are noted by the driller on the log.

Naturally, if there is an increase of gas coming from the casing, more gas has been encountered in the bottom of the hole. At the same time, the driller notes the various formations which he is drilling in, whether it be limestone, Shale, Dolomite, Granite Wash or what not.

Q. How does he obtain that?

A. By obtaining samples. Lowering the bailer in the hole, taking the bailer out and taking the samples out of the bailer and examining the samples and then later, they are filed in the office.

[fol. 4211] Q. And as you have indicated, he cannot do that when the well is large?

A. When the volume of gas is large, the cuttings are blown from the hole and cannot be caught in the bailer and brought to the surface.

Q. Isn't that situation which you have just described the normal situation in the Panhandle Field?

A. Sometimes it is, sometimes it is not.

Q. Most of the time it is, isn't it?

A. I would say about half the time it is and half the time it is not, because there are large wells and small wells in the Panhandle.

Very often you can catch samples from the large wells before the great volume of gas has been reached. Very often your can catch samples below the point at which the great volume of gas is reached.

Q. Well, if you had 10 different drillers drilling this well, you would probably get 10 different answers on the pay thickness, wouldn't you?

A. That is true. For that reason, the best way to determine the thickness of pay is by using the driller's log in combination with a study of the samples under the microscope.

Q. That is, if you have any samples?

A. Yes, sir.

[fol. 4212] Q. When you get the sample, it is usually a powdery substance, is it not?

A. It is very fine.

Q. What do you do with it then?

A. Examine it under the microscope.

Q. And what can you see under the microscope? What can you determine by looking at it?

A. You can determine whether or not there was any porosity. There must be porosity or there will be no gas.

Q. Of course, your know that before you look at it under the microscope, do you not?

A. That is true.

Q. What is the advantage of looking at it under the microscope?

A. If you find that the driller has logged an increase in gas and the samples reveal that there is porosity in the samples, I believe it is safe to assume that there has been a gas pay at that depth.

Q. What can you observe by microscope of one of these powdery samples that would reveal the identity of the strata?

A. My college training enables me to be able to determine whether or not the substance in the sample was shale, lime, dolomite, granite wash and such.

Q. Well, what could you see that would identify the sand with respect to whether or not it was a producing sand?

[fol. 4213] A. If there is the presence of porosity.

Q. The sand is all ground up and pulverized when you look at it, isn't it?

A. It is in rather small particles. That is the reason we use a microscope, in order to be able to see them better.

Q. Can you tell anything about porosity looking at these fine granules? A. I think I can.

Q. Can you tell the percentage of porosity by any such method as that?

A. Not definitely. I can only estimate.

Q. You would not come very close either, would you, by that method?

A. That is a matter of opinion.

Q. We will come to the porosity question a little later. I meant to stick close to the pay thickness for the time being.

Now, you testified that a number of different drillers would probably secure different results in their logs. Isn't it also a fact that different geologists would also secure different results when they examine the same log and the same samples from the same well?

A. Yes, the human element will enter into it.

Q. And there would be some very wide variations and [fol. 4214] differences, would there not?

A. Not necessarily. That is the reason that we use the driller's log and the samples in conjunction, so as to be able to determine, as nearly as possible, the actual circumstances with all data that we have.

That is practically all of the data that is available from drilling the well, the driller's log and the samples.

Q. You use it because you do not have anything better to use?

A. That is true. You cannot see down in the hole.

. . . . . .

Q. Mr. Culton: You said, "is compensated." I wondered if you meant "is not compensated."

[fol. 4215]

Mr. Littman: Whether or not that flow of gas is or is not compensated, yes.

The Witness: I do not know what you mean by the "decline of gas."

By Mr. Littman:

Q. I mean the decline in gas from that which is originally secured when the pay sand is first struck.

A. Do you mean that you get a certain open flow and then later you have a less open flow than you did have formerly?

Q. That is right, and then you come into some more production as you drill deeper, that is the situation.

A. That is possible.

Q. It occurs quite frequently, does it not?

A. I would not say so, no.

Q. Well, when it does occur, how can you, as a well driller, accurately determine the thickness of the various pay strata in those circumstances?

A. By the same method. I would use a driller's log wherein he records the various open flows as the drilling of the well progresses, and by examination of the samples, determine whether or not porosity existed at the point where he recorded an increase.

The only other interpretation to your question that I can [fol. 4216] see is that sometimes, after the pay streak is reached and an open flow test is taken, later it may blow down slightly to a slightly lesser volume, but—

Q. (Interposing) That is the situation—

A. (Continuing)—but that decline is not usually great. The blow-down, so-called, is not usually great.

Q. Well, when it blows down like that, what do you attribute it to?

A. The fact that the head has been blown off the gas in the formation in which it was originally contained.

Q. Do you, or do you not, count that in the depth of the sand?

A. It is considered, yes.

Q. In various ways by various drillers?

A. Well, the drillers do not determine the thickness of pay.

Q. Doesn't the driller make some record on his well log concerning the thickness of the strata encountered?

A. Yes. However, he does not determine for me what I think the thickness of pay is. I use his log in conjunction with the samples to determine what I think the thickness of pay is.

Q. You do not know what he would interpret the situation to be?

A. Yes, I have his idea on the log.

[fol. 4217] His idea would be different from someone else's idea?

A. His idea would influence my opinion to a certain extent.

Q. And various drillers might interpret, and probably would interpret, that situation differently?

A. That is natural.

Q. Well, at any rate, in order to get an exact determination of reserves by the porosity method, you have to know the exact weighted average pay thickness throughout the area for which you are making the determination, do you not?

A. That would be the best thing to have, yes. When you do not have it exact, then you must use the best thing you have.

Q. No matter how inexact it is?

A. No matter how inexact it might be.

Q. Now Mr. Smith, another element that is required in determining reserves by the so-called porosity method is to determine the porosity, is it not?

A. Yes, sir.

Q. Just a moment, before I go to porosity, can you state how many of the 40 wells that you used for the purpose of determining its average pay thickness is lodged in the Class 1 and Class 2 acreage?

A. No, I cannot, not at this time. I could designate [fol. 4218] that on the list which I will supply you.

Q. I wish you would add that bit of information to the schedule which you will supply.

A. Yes, sir.

Q. You do not have any recollection at all as to how many, approximately?

A. I would rather not say at this time.

Q. Now, what porosity of pay sand under the acreage controlled by Panhandle Eastern did you use?

A. Twenty percent.

Q. Is that a straight, flat 20 percent for the entire Panhandle Eastern acreage? A. The Class 1 acreage.

Q. That is for the Class 1. How about the Class 2 acreage?

A. I did not estimate the porosity of the Class 2 acreage.

Q. Can you give us any ideas that you may have on the subject as to the porosity of the Class 2 acreage?

A. It would probably be less, possibly in the neighborhood of 15 percent.

Q. Now, how did you arrive at the porosity of the acreage in the Panhandle Field?

A. I have taken what is generally accepted by other geologists who have worked on this same problem.

[fol. 4219] Q. I take it by that answer that you did not undertake an independent investigation of your own?

A. That is true.

Q. Have you ever seen any cores taken from acreage controlled by Panhandle Eastern?

A. Not in the Panhandle of Texas.

Q. Now, perhaps for the purpose of the record, we had better explain what a core is. Of course, it is a core of the producing sand that I am referring to.

A. A core of the producing sand is a cylindrical column obtained by using a rotary drill with a coring bit containing a core barrel and represents the strata penetrated by the drill from the surface to the bottom if the core bit is used during the drilling of the entire well.

Q. How large is a core?

A. It might be various diameters. It might be two inches in diameter or it might be three inches in diameter, or it might be 2-½ inches in diameter.

Q. And how long?

A. As long as the core bit and core barrel is used on the rotary tools.

Q. Approximately?

A. Some of them go from the surface to the bottom. Others go from the top of the producing formation to the bottom of the well. Sometimes a section merely ten or [fol. 4220] twelve feet is taken. It varies.

Q. Have you ever seen any cores taken from the pay sand of acres controlled by Panhandle Eastern?

A. Not in Texas Panhandle.

Q. Neither has anyone else?

A. Not as far as I know.

Q. And why is that true? Isn't it a fact that you cannot get any?

A. It would be difficult to obtain a good core of a producing formation in the Texas Panhandle.

However, some cores have been taken by other companies.

Q. In the West Panhandle Field? A Yes, sir.

Q. Will you please give me the name of the company that has taken a core, and the well from which it was taken?

A. In the article referred to yesterday—strike what I started out with, because I do not find what I expected

there—I have seen some cores that were said to have been taken from the wells in Texas Panhandle.

I do not know what wells they were taken from. I have also read that cores have been made from wells in the Texas Panhandle and porosity determinations have been made from these cores.

I cannot cite any specific examples right now.

Q. Are you now referring to cores that were taken from [fol. 4221] the producing horizons?

A. Yes.

Q. You understand, do you not, that if the cores were taken from the producing horizons, they would be taken from the least porous portions, would they not?

A. Probably.

Q. That is to say, you would get the harder part of the producing sand which, in all probability, does not produce much gas?

A. That would be the most likely thing to get.

Q. In other words, is my understanding correct, Mr. Smith, that the good producing portions of the producing sand in the Texas Panhandle Field is rather a soft substance that is more or less chalk-like in nature?

A. I would not say it was chalk-like.

Q. Suppose you describe it.

A. The producing formations that I have examined, the Dolomite is rather a hard, crystalline substance with a great many pores apparently existing.

The Lime was not chalk-like but more inclined to be brittle. The Granite Wash, of course, is an unconsolidated substance which would disintegrate very easily.

Also, it is my belief that porosity varies in the Texas Panhandle Field from zero to 100 percent, the 100 percent probably occurring most frequently in Limestone subter- [fol. 4222] ranean caverns, Granite fissures or crevices.

Q. And the zero would occur in what kind of strata?

A. The zero would occur in solid granite, Limestone without porosity, Dolomite without porosity.

Q. Now, I believe you stated that cores are taken by the rotary drill? A. Yes, sir.

Q. What kind of drills are used in the Texas Panhandle Field?

A. Our drilling practice is to drill to the top of the producing formations with a rotary rig, and complete the well with a cable tool rig.

Q. Now, will you briefly describe this cable tool rig?

A. The cable tool rig is chiefly a steel cable with a string of tools on the bottom, consisting of a rope socket, a set of jars, a stem and cable tool bit.

This bit operates very much like a churn drill, being raised and lowered and the cutting accomplished by the fall of the bit on the various formations.

Q. In other words, the drilling is accomplished by the percussion method? A. Substantially.

Q. And that percussion has the effect of pulverizing the pay strata, does it not?

A. I do not consider it pulverizing, Mr. Littman.

[fol. 4223] Q. You correct me—

A. (Interposing) Something pulverized, I would say, would be like a powder that a pharmacist might make, using a mortar and pestle to pulverize the substance.

The samples I have examined are more like sand, or very fine gravel than a powder.

Q. Very fine is what you used, and I used the term "pulverized". It is satisfactory to use, "very fine"?

A. Yes.

Q. In order to determine accurately the reserves under acreage, you have got to know the exact porosity of the pay thickness, the pay sand, do you not?

A. As near as can be determined.

Q. Now, how do you go about determining the porosity after you have the sand? What do you do with it to determine the porosity of it?

A. The best method of determining the porosity would be from cores, running porosity tests on the cores obtained from the various producing formations.

Q. In other words, the accepted method and the best method, is to take the core? A. That is true.

Q. And take it to the laboratory? A. Yes, sir.

Q. And then what do they do with it in the laboratory?

[fol. 4224] A. I cannot define exactly the steps, the mechanics of making a porosity test. There are several methods, however.

Q. Well, Mr. Smith, it is rather intricate, is it not, the method that they use?

A. I believe the general idea is displacing the pores within the core by a liquid and determining the amount of liquid which entered the pores in comparison to the total volume of the core being tested. That is one method, at least.

Q. Now, on these 40 wells that you used for purposes of determining the pay thickness in the acreage of Panhandle Eastern, did you have any porosity tests made?

A. No, sir.

Q. Any cores for those wells? A. No, sir.

Q. Or have any samples for those wells?

A. Yes, sir.

Q. Why didn't you?

A. I did not have any cores to be tested.

Q. That is one of the difficulties in the Panhandle Field, is it not?

A. That is true. There are many.

Q. And that is one of them, but if you wanted to be exact about it, that is what you would have to do, namely, take a core out and send it to the laboratory and have tests made?

[fol. 4225] A. That would be the most accurate way of determining the porosity, but you could not determine the porosity by examining any one core. You would have to test many, many cores to determine the average porosity.

Q. That is precisely what I was coming to next.

As I understand it, Mr. Smith, when you got through sending this one core to the laboratory and having it tested for porosity, you would know what the porosity is for that one piece, and that is all, isn't that right?

A. That is true.

Q. You could not, by that method or manner, determine what the porosity was for an entire acre, for instance, without sending the entire acre up to the laboratory, could you? A. That is true.

Q. Nobody ever did anything like that, did they?

A. Not to my knowledge.

Q. Do you know of any tests that have been made of the producing sands in the Panhandle Field for porosity?

A. For porosity tests?

Q. Yes.

A. I have heard that some have been made and was led to believe that the cores that I saw belonging to other companies had been tested for porosity.

The porosity figure that I used, 20 percent, was used because it has been accepted for the last 15 years as being [fol. 4226] the—I would not say 15 years either—for the last 8 or 10 years, as being the porosity average of the Texas Panhandle Field.

Q. Have you ever heard of a geologist by the name of Ralph E. Davis? A. Yes, sir.

Q. Did you hear him testify in this proceeding?

A. No, sir.

Q. Do you consider Mr. Davis an authority on the subject of geology in the Panhandle Field?

A. He has made a great many studies of the Panhandle Field. I really do not know what it would be necessary to determine whether or not he is an authority.

Q. Well, considerable reliance has been placed upon Mr. Davis' judgment and estimates in this proceeding, and I take it you do not consider the reliance misplaced?

A. No.

Q. I am going to read you what Mr. Davis said at transcript Pages 1526 to 1527 and then ask you a question about it. This is Mr. Davis talking:

"Nobody has ever taken a core of even a single well, so far as I know, and had the porosity determined throughout the pay zone from top to bottom but even if he had done that and had it done for 25 wells, he still would have only 25 samples in a field 125 miles long so he would not have anything anyway."

[fol. 4227] So far, you and Mr. Davis are in substantial agreement, are you not?

A. That is true.

Q. I will read on:

"He would have another one of these little things, one-quarter inch long, to measure the Washington Monument with. We know pretty well how thick the producing zone is in the Amarillo Field from data from more than a thousand wells. I think the figure is 71½ feet average

thickness but nobody knows whether the porosity is 20, 30 or 35 percent. The boys who use 20 think 20 is a good figure to use. I think 30 would be a better figure myself. The reason I think 30 would be better is because it must be 30 if the answer we have by the other method is right."

Do you agree with Mr. Davis' conclusion that 30 percent is the proper porosity figure? A. I do not.

Q. You used 20? A. Yes, sir.

Q. And, of course, if you had used 30 in your calculation, you would have come out with a much higher estimate of reserves, is that correct?

A. That is true. I imagine it would have been approximately 50 percent higher.

Q. Approximately 50 percent higher, is that correct?

[fol. 4228] A. That is what I said.

Q. Well, there are differences of opinion as to porosity and as to other matters, I take it?

A. I can only say that that is most widely accepted, that the porosity of the Texas Panhandle Field is 20 percent.

Q. Now, will you tell us what you mean by, "most widely accepted"? Who are the men, generally, who accept it, and tell us how you arrived at that conclusion?

A. Mr. Cotner and Mr. Crum agreed that 20 percent was the average porosity in the Texas Panhandle Field. I have talked to numerous other men and read numerous other papers, where 20 percent was taken as the average porosity.

I believe the gentleman you mentioned yesterday, Mr. Peterson, of the Texoma Natural Gas Company, takes 20 percent as the average porosity.

Q. You spoke about these gentlemen agreeing on 20 percent. Do you mean by that to imply that they sat down and kind of reached an agreement not to disagree about this 20 percent?

A. I do not mean that at all. I think each man's work was independent of the others.

Q. But you are not at all certain about how each man arrived at the 20 percent?

A. No, I am not. I only know that they have used that.

Q. Yes, and you know that there are other geologists [fol. 4229] that do not use it?

A. Mr. Davis, for instance.

Q. Any others that you can mention or name that do not agree with the 20 percent figure?

A. I do not recall any others, right offhand.

Q. You do not doubt there are others that disagree?

A. I do not doubt it. It is entirely natural that individuals would differ in opinions.

Q. On such a highly controversial subject?

A. On porosity, as well as many other subjects.

Q. Well, have you ever made a study of the methods used by each one of these geologists that you have named who have arrived at a figure of 20 porosity?

A. I have read some of their studies, yes.

Q. But you did not participate in their methods?

A. No, sir, I did not.

Q. Are you certain that you know the precise and exact data used by them to arrive at this 20 percent figure?

A. No, I do not.

Q. In other words, you are relying upon the authority of the individual, rather than upon any particular individual method followed or used by the individual geologist, is that a correct statement?

A. I do not understand exactly what you mean by authority.

[fol. 4230] Q. I use it in this sense, Mr. Smith, that oftentimes we accept the statement of a gentleman distinguished in a given field simply because he made it and because we respect his ability and his background and his reputation, as contra-distinguished from those instances where we make our own independent investigation of what he did to arrive at his conclusion.

Do you see now what I am driving at?

A. Perhaps I had better answer the question this way, that the reason I accepted these gentlemens' opinion in the first place, it appeared reasonable to me. In the second place, all of the men who have used that figure of 20 percent have had a great deal of experience over a long period of time in the Texas Panhandle Field and, as you say, I valued their opinion, in view of their experience.

Q. Let's analyze what you have just said for a moment. You say that their conclusions sounded reasonable to you?

A. Yes, sir.

Q. Now, you made no independent check to ascertain whether or not their conclusions were or were not reasonable, did you?

A. No.

Q. By that statement, I take it you mean it just struck you as being about right, but you did not have any particular data to tie it to?

[fol. 4231] A. That is true. I think we all accept other people's opinions if we consider them capable of making logical decisions and of good reasoning power.

Q. Do you know whether or not any of these gentlemen upon whom you so heavily relied for the basis of this 20 percent porosity had ever made any actual porosity tests of the producing sand in the Panhandle Field?

A. No, I do not know whether they have, or whether they have not.

Q. Can you state for us, Mr. Smith, what the average rock pressure of the acreage controlled by Panhandle Eastern was as of June 30, 1941, or have your already stated that you could not make such a determination?

A. I do not believe I have stated it previously, but I do not know.

Q. Have you ever undertaken to make such a determination?

A. I do not believe I have.

Q. Have you ever undertaken to do so for any date of the year 1940?

A. Yes, and also the year 1941—you said the average rock pressure under wells on Panhandle Eastern acreage?

Q. The average rock pressure of the acreage controlled by Panhandle Eastern on or about June 30, 1941.

A. No, not that.

[fol. 4232] Q. Not that; and you did not do that for any of the years 1940, 1939, 1938 or 1937?

A. No, sir.

Q. Now, you have just indicated, Mr. Smith, that you did make some determination of average rock pressure. Now, will you state which one you made?

A. They were arithmetical averages of the wells now existing on Panhandle Eastern acreage.

Q. Is that contained in your Exhibit 30?

A. No, sir.

Q. I did not recall whether it was, but I wanted to make certain that my recollection was correct. Do you have such determination with you?

A. It does appear in my exhibit.

Q. What page?

A. Schedule 8, Page 4, Column D, Line 26.

Q. Now, these data are shown as of July, 1940?

A. Yes, sir.

Q. Do you have the same figure for 1941?

A. Yes, sir.

Q. And that is in column—

A. (Interposing) No, it does not appear on the exhibit.

Q. I looked at Column G, and I notice now that is total production. Where does your 1941 figure appear?

A. I have it here. It was not available at the time the [fol. 4233] exhibits were made.

Q. Perhaps it would be well to read it into the record at this point.

A. The arithmetical average rock pressure of wells connected to Panhandle Eastern Pipe Line Company in the Texas Panhandle Field as of the summer of 1941, is 324.43 pounds.

Q. Is the figure that you have given me the total figure for both company-owned wells and the wells owned by gas vendors?

A. All those connected to Panhandle Eastern Company's lines in the Texas Panhandle Field.

Q. You could not break that figure down in the same manner as you did for Schedule 8, I do not mean by individual wells, but I mean by classes of wells?

A. Yes, I can.

Q. I would appreciate it if you would do that, Mr. Smith.

. . . . . .

[fol. 4237] Rufus M. Smith, resumed the stand, and testified further as follows:

Cross-Examination (Resumed)

By Mr. Littman:

Q. Mr. Smith, at the conclusion of the morning session you were about to read into the record the 1941 figures

with respect to rock pressures of the wells owned and controlled by Panhandle Eastern. Would you mind doing [fol. 4238] so now?

A. I refer to Exhibit 30, Schedule 8, page 4, column D.

The arithmetical average of the 53 wells mentioned in Line 24 for 1941 is 298.02 pounds. The arithmetical average for the 57 wells mentioned in Line 25—in both instances this is Column D—for 1941 is 348.54 pounds.

I believe that makes all three figures which we were going to bring up to date.

Q. I presume the figure for Line 23, Column D, is already included in one of the tables that you have named, is it?

A. I have a new figure that could be inserted there for 1941, Line 23.

Q. Would you mind giving us that figure, please?

A. That figure of Schedule 8, page 4 of Exhibit 30, Column D, Line 23, for 1941 will be 341.28 pounds.

Q. And the figure for Line 26, Column D, for 1941 is the one which you read into the record just before the close of the morning session, to-wit, 324.43 pounds?

A. That is correct.

Q. Which represents the grand total for 110 wells in Texas?

A. That is correct.

Mr. Culton: While you are on that would you mind [fol. 4239] giving us the relative value of Line 4, for 1941, the 22 Huber wells?

The Witness: That figure is 242.41 pounds for 1941.

By Mr. Littman:

Q. Mr. Smith, do you know of any test having been made to determine porosity of the producing formation in any gas well in the Panhandle field?

A. It is my impression that I was shown a core of a gas well in the Panhandle field which had had porosity tests run on it. As I said this morning, I cannot say what well that was or where it was located, because I don't remember.

Q. Do you know the result of the test?

A. As I recall the porosity varied considerably in various tests that were run throughout the core.

Q. Can you give us the figures?

A. No, I cannot. However, I have reason to believe that the porosity throughout the field will vary from zero to 100 percent, as I stated this morning.

Q. Now, do you know who made the tests on that particular core?

A. No, sir.

Q. Do you know of any other tests that have been made?

A. No, sir.

[fol. 4240] Q. And, as I recall your testimony this morning you stated that the core which you saw was probably from a part of the producing sand which was not highly productive?

A. Probably so.

Q. And that was because of the fact that the more productive portion of the sand is of such character that it will not permit the taking of a core?

A. That is true.

Q. Do you know the name of the company from whose lease this particular core was taken?

A. No, I don't. As I remember—it has been several years ago—I believe the core was in the office of the Columbia Fuel Company of Amarillo, Texas. The geologist had it there.

If I remember correctly it was in that office, but I don't know what company drilled the well.

Q. Do you recall whether or not the core was in Mr. McCue's office in Amarillo?

A. No, it was in the same office, but in the office of Mr. Hemsell. They are in the same office together in Amarillo, Columbia Fuel Company.

Q. In the same building?

A. In the same building.

Q. Going back for a moment to the approximately 40 wells from which you determined the average pay thick-
[fol. 4241] ness of the producing horizon underlying the Panhandle Eastern acreage, do I understand that you merely totalled the thicknesses and then divided by the number of wells?

A. That is true. I obtained an arithmetical average.

Q. Isn't there another way of determining average pay thickness, namely, a method by which you weight the thickness as against the acreage?

A. There probably is. I don't believe it could be accurately done, however. There would be a great many exceptions made if a method of that kind were used.

Q. In other words, you would have to assume by the method that I have suggested, a certain area around a well having a given pay thickness?

A. That is true.

Q. Is that method very commonly used?

A. I don't know of any case where it has been used.

Q. Of course, when you merely take the total thicknesses of 40 wells, or some such number, and divide by the number of wells, you are making quite a few assumptions, too, by that method, are you not?

A. That is true. However, the figure that I obtained from that operation agrees very well with authorities' estimates of the average thickness of pay in the Panhandle gas field.

[fol. 4242] Q. Who are the authorities to which you are referring?

A. Well, these two gentlemen who wrote the paper referred to previously, Cotner and Crum, in which I believe they estimated the pay thickness to be 69½ feet. Some others of whom I read have estimated it to be 70 and 72 feet, all of which are very close together.

Q. Now, the estimates of these experts have reference to the entire Panhandle field, do they not?

A. Yes, sir.

Q. As distinguished from the Panhandle Eastern's acreage?

A. Yes, sir.

Q. Have these other experts ever made a determination for Panhandle Eastern's acreage?

A. No.

Q. That determination was made by you from the approximately 40 wells that you have told us about a few minutes ago?

A. Yes, sir.

Q. Now, you have made an estimate of the remaining gas content of Panhandle Eastern Pipe Line Company in

its acreage in the Texas Panhandle field, which is shown in Exhibit 30, have you not?

A. Yes, sir.

[fol. 4243] Q. I note that you use from time to time a description "Remaining Gas Content," in describing your estimate of reserves. What do you mean by "Remaining Gas Content"?

A. The gas remaining in the formations of the Panhandle gas field.

Q. As of July 1, 1941?

A. Yes, sir.

Q. Does it mean the reserves now under Panhandle Eastern's acreage which will be recovered by Panhandle Eastern?

A. Not necessarily.

Q. Well, will you explain what you mean by "Not necessarily"?

A. I mean that I don't know at what abandonment pressure the field will be abandoned.

Q. Suppose you turn to Schedule 3 and we will refer to specific figures. Now, the amounts that you show at the foot—

A. That is page 2?

Q. Schedule 3 of your Exhibit 30. Schedule 3, page 1, and page 2.

At the foot of the columns D, F, H, and J, of each of those pages, you have figures which purport to represent the number of m.c.f.'s, do they not?

[fol. 4244] A. Yes.

Q. Now, each one of those figures represent the recovery at the abandonment pressures shown at the top of the columns, do they not?

A. That is true.

Q. You have eight different figures, each one representing a different abandonment pressure.

A. That is right.

Q. Now, I am referring to those figures at the foot of each of those pages.

Do these figures represent the amount of gas as of July 1, 1941, which will be recovered by Panhandle Eastern Pipe Line Company at the assumed abandonment pressures shown at the top of each of those columns?

A. That is my estimate of what the figure would be at the various abandonment pressures.

Q. Now, you start out with an abandonment pressure of 150 pounds and then you go to 125, and then to 100, to 75, to 50, to 30, to 25, and to zero, do you not?

A. Yes, sir.

Q. And I take it from your answers previously made that you are not testifying with respect to which abandonment pressure will actually be the true abandonment pressure of the field?

A. That is absolutely true.

[fol. 4245] Q. In other words, you merely show the estimate upon the eight assumptions?

A. That is true.

Q. Now, do you mean that this gas is in place in the acreage at present?

A. That at least that amount is in the acreage at present if taken down to the various abandonment pressures.

Q. In other words, you are not including in this estimate any gas under somebody else's acreage?

A. No, sir.

Q. That may or may not be recovered through Panhandle Eastern's wells?

A. No, sir.

Mr. Culton: Nor are you taking into consideration any that might be drained from somebody else's leases.

The Witness: That is absolutely true.

By Mr. Littman:

Q. In other words, you are taking gas in place as you can best estimate it?

A. That is true.

Q. And, of course, this estimate shown on Schedule 3 includes the estimate of gas in the acreage subject to gas purchase contracts with Panhandle Eastern Pipe Line Company?

A. That is right.

[fol. 4246] Q. Now, are these reserves shown at the foot of these eight columns, what might be properly described as recoverable reserves?

A. It is sometimes referred to in that manner and you might say that that is true.

Q. That is, of course, based upon the assumed abandonment pressure? A. That is right.

Q. Now, I know that the abandonment pressures have quite a great effect upon the amount of gas that will be ultimately recovered, do they not?

A. Yes, sir.

Q. Would you mind reading into the record the eight figures for each of the abandonment pressures that you have used? A. That are found on Line 19?

Q. Yes.

Mr. Wheat: I think possibly that might be misunderstood, Mr. Littman. Do you mean the amounts for the eight abandonment pressures?

Mr. Littman: Yes.

Mr. Wheat: You couched your question a little the opposite of that, and I wondered if you mean it.

Mr. Littman: I am glad to have you correct me at any time I misspeak myself. That is why I thought it would be [fol. 4247.] well to read each figure into the record at each abandonment pressure.

The Witness: I estimated remaining gas content in the Texas Panhandle field under acreage constituting reserves of Panhandle Eastern Pipe Line Company as of July 1, 1941, at a pressure base of 16.4 pounds absolute as found in Exhibit 30, Schedule 3, page 1, line 19, in Column D, as 387,361,187 m. c. f. at 150 pound assumed abandonment pressure.

In Column F, 445,520,475 m. c. f. at an assumed abandonment pressure of 125 pounds.

In Column H, it is 503,679,762 m. c. f. at an assumed abandonment pressure of 100 pounds.

In Column J, it is 559,798,371 m. c. f., at an assumed abandonment pressure of 75 pounds.

On page 2 of the same exhibit, same schedule, Column D, Line 20, 618,977,998 m. c. f. at an assumed abandonment pressure of 50 pounds.

Column F, is 663,872,884 m. c. f. at an assumed abandonment pressure of 30 pounds.

Column H shows 675,096,607 m. c. f. at an assumed abandonment pressure of 25 pounds.

Column J shows 733,255,894 m. c. f. at an assumed abandonment pressure of zero pounds.

Q. The figures which you have just read represent the gas which you estimate will be recovered by Panhandle [fol. 4248] Eastern Pipe Line Company at each of the abandonment pressures that you have named?

A. At least that much.

Q. Will you please describe what you mean by "at least that much"?

A. This estimate was made, in my opinion, on a very conservative basis as stated in my written testimony. It was made on what I consider the basis of the average in the field.

I stated that it was conservative several times in the testimony, and I have an exhibit in here attempting to show why I made the statement that it was a conservative estimate.

Schedule 5 of Exhibit 30 is a comparison of open flow potentials from the Texas Panhandle field.

On Schedule 5 I have shown that the average potentials of the wells connected to Panhandle Eastern Pipe Line in Texas are greatly in excess of the average potentials of the wells in the rest of the field.

Q. Indicating that the—

A. Indicating that if anything there will be a greater recovery from Panhandle Eastern acreage than from the average of the rest of the Texas Panhandle field.

Q. In other words, in making this estimate, if I understand you correctly, if you erred you did so on the side of making a low rather than a high estimate?

[fol. 4249] A. That is what I attempted to do, to make a conservative estimate.

Q. Now, in addition to these assumed abandonment pressures, ranging from 150 pounds down to zero, as you have read them into the record, you have used the so-called recovery factor, have you not?

A. Yes, sir.

Q. And will you please state the effect of using the recovery factor?

A. The recovery factor in fact makes the estimate even more conservative. However—

Q. (Interposing) By how much?

Q. By 10 percent. The reason the recovery factor was used is due to the fact that as far as I know, and as far as I have been able to learn, there has never been a gas field in history which yielded all the gas which was originally in place.

The Texas Panhandle Field is no different from the other fields. There are factors which prevent the ultimate recovery of all the gas originally in place in that field. Some of these factors are the unequal withdrawal of gas, the encroachment of water, the inefficient drilling practices of some of the producers, especially in the early days of the field, the varied types of the formations from which the gas is being produced.

[fol. 4250] There are some others.

Q. Well, isn't that one reason why you use these various abandonment pressures, namely, for the purpose of stating that you are not going to recover all the gas and, therefore, you are going down to 25 or 30, or 75 or 100 pounds, rather than down to zero pounds?

A. I don't say that it will be abandoned at 150 or any other assumed abandonment pressure, or even the zero abandonment pressure.

Q. Well, I didn't mean to infer that you were, but I understood that when you used an abandonment pressure of, let us say, 50 pounds, the reason for using that abandonment pressure of, for example, 50 pounds, was because it is assumed that you will not get all of the gas out of the ground and, therefore, you will abandon at 50 pounds rather than at a lower pressure?

A. That is true, and—

Q. (Interposing) Why did you—

Mr. Wheat: Let him finish his answer.

By Mr. Littman:

Q. Have you finished your answer?

A. No, I have not.

Q. Proceed.

A. That is true, and yet, even so, you must make a further reduction for the amount of gas which will be ob-
[fol. 4251] tained, if for no other reason than applying a safety factor.

Q. Well, the effect of using this 90 percent recovery factor in each instance, is the same as if you had used, instead of 50 pounds, for instance, a slightly higher abandonment pressure. Is that correct?

A. It has the same effect.

Q. Well, we will come back to the recovery factor a little later. I didn't mean to go into it quite as deeply at this point.

I wanted to be certain that I understood how this exhibit worked.

Now, will you please turn to Page 1 of Schedule 3? I would like to have you give us a description of, let us say, the first five or six lines so that we may make certain that we understand how this exhibit works. Is my understanding correct, first, that you have the company-owned and drilled Class 1 acreage in Line 1?

A. Yes, sir.

Q. An an original amount of gas shown at Column D of 540,664,200 M. c. f.? A. That is right.

Q. Now, you don't have the description "M. c. f." throughout this schedule. Am I correct in understanding that all figures are on an M. c. f. basis?

A. The heading indicates that, Mr. Littman, "abandon-
[fol. 4252] ment pressure M. c. f."

Q. That heading applies to the entire schedule?

A. Yes, sir.

Q. I am sorry. Now, tell us how you secured your figure of 540,664,200 M. c. f. for Class 1 acreage. Is that shown in another schedule?

A. Yes, sir, that is shown in Schedule 2 of Exhibit 30.

Q. And there you show that you have 30,546 Class 1 acres?

A. Yes, sir, company-owned and drilled.

Q. Company-owned and drilled, Class 1. And you use for that acreage, an "original amount of gas M. c. f. per acre," as shown in Column D of Schedule 2, of 17,700 M. c. f., do you not? A. Yes, sir.

Q. And the amount of 540,664,200 M. c. f. is simply the result of multiplying the number of acres by the 17,700 M. c. f.? A. That is true.

Q. Now, is the same true with respect to the amount shown in Line 2 of Schedule 3, Page 1, Column B, of 3,700,000 M. c. f.? A. Yes, sir.

Q. And that is the result of multiplying 740 acres of company-owned and drilled Class 2 acreage by a 5,000 M. [fol. 4253] c. f. amount of gas per acre?

A. That is true.

Q. Now, will you please follow through on Page 1 from those figures?

A. The figures you have just read appear in Column B, Schedule 3, Page 1, Lines 1 and 2 of Exhibit 36.

In Column B, Line 3, the figure is the sum of the first two figures.

Q. Would you mind now, going to Column C and going across?

A. Column C is obtained by applying the 63.1 percent to the 540,664,200 M. c. f. and obtaining 341,159,110 M. c. f.

Q. [And] I correct in understanding that the amounts shown in Column B represent the original amount of gas in the ground before any drilling occurred on that particular acreage? A. Yes.

Q. Now, how did you arrive at this 63.1 percent shown in Column C? What does it represent?

A. That represents the percentage of gas which would be removed to the assumed abandonment pressure of 150 pounds.

Q. Rather an intricate calculation is required to arrive of that?

A. A formula is used, and various figures inserted in the formula and the percentage arrived at.

[fol. 4254] Q. But the sum and substance of it is that the amount shown in Column C is the amount that would be recovered if you used an assumed abandonment pressure of 150 pounds?

A. Before the recovery factor is applied.

Q. That is in Column D, is it not?

A. That is true.

Q. And there you take 90 percent of Column C?

A. That is true.

Mr. Culton: Right there, so that we may understand that, 150 pounds was the sand face pressure rather than well head pressure, wasn't it?

The Witness: That is true.

Mr. Culton: And the same is true of all of them?

The Witness: The original amount is the sand face and the remainder appearing under the abandonment pressure headings on both Page 1 and Page 2 are at the well head.

By Mr. Littman:

Q. The 150 pound abandonment pressure shown on Page 1 of Schedule 3, however, is at the well head?

A. That is true.

Q. And that is true of the other abandonment pressures? A. Yes, sir.

Mr. Culton: But the sand face was used as the base in determining percentage?

Mr. Littman: Which percentage, Mr. Culton?

[fol. 4255] Mr. Culton: 63.1. I am just asking him. I don't know myself.

The Witness: The original amount of gas in Column B of both Page 1 and Page 2 of Schedule 3, Exhibit 30, represents conditions at the sand face.

Now all the other figures on these two pages, under the general heading, "Abandonment Pressures" were calculated to the well head.

By Mr. Littman:

Q. Calculated by a formula? A. Yes, sir.

Q. Which is represented by the percentages shown for each of the assumed abandonment pressures immediately above the letters C, E, G and I on Page 1 of Schedule 3?

A. That is right.

Q. Well, will you please explain Lines 5 and 4?

A. Lines 4 and 5 are deductions made from the calculated amount of gas, due to the fact that withdrawals have been taken from the calculated amount of gas for production into the pipe lines as well as unmetered production

which is an estimated figure due to wells blowing open during the course of drilling, tests which are made, wells which are opened up and conditioned at various times during the year and that gas, you might call wasted.

Q. Did you make this estimate of unmetered gas?

[fol. 4256] A. Yes, sir, and I have a schedule in this exhibit to show how it is made.

Q. And that schedule is—

A. Schedule 4.

Q. Well, you show the results of how it was made, but you don't state there how you arrived at this particular figure.

A. I will be glad to explain it.

Q. Would you mind doing that for us?

A. In Schedule 4 of Exhibit 30, Column C, the 260,000 M. c. f. in the heading of Column C represents the gas wasted while the wells were being drilled.

There the average open flow of the wells considered was approximately 26,000 M. c. f. I assumed that each one of the wells considered blew open while drilling approximately 10 days under full open flow, or possibly 20 days under half the final open flow.

That would be 10 times 26,000 M. c. f., or 260,000 M. c. f.

In Column D I considered it reasonable to use the figure of 4,333 M. c. f. per well per year as the amount of gas wasted during conditioning of the wells, which is the amount of gas which would be blown from an average well during the course of four hours, or one-sixth of 26,000 M. c. f., four hours being one-sixth of 24 hours.

In Column E I used the figure of 542 M. c. f. which was [fol. 4257] withdrawn while the wells were being tested each year.

The 542 was [arriving] at by taking 1/48th of 26,000 M. c. f., or the equivalent of one-half hour of blowing open per well per year.

Line 1 of the same schedule for the year 1931, shows there were 23 producing wells. Under Column D 23 wells at 4,333 M. c. f. per well per year, gives 99,659 M. c. f. for those wells for that year.

Similarly, in Column D 23 wells tested at 542 M. c. f. per well for that year would give a figure of 12,466 M. c. f.

Does that explain it sufficiently?

Q. Yes. Well, now, the important figures on this Schedule 3, of course, would be the figures appearing in Column B, Original Amount of Gas. Isn't that correct? The whole thing is predicated upon the accuracy of the original amount of gas which you used.

A. That is the first figure and various computations are made from that figure.

Q. And if those figures are wrong, everything else in this schedule is correspondingly off, isn't it, because everything else in this schedule is predicated upon the accuracy and correctness of your original gas content?

A. It is according to what you mean by "wrong." I have stated previously that this is an estimate and that I consider the estimate conservative.

[fol. 4238] If by "wrong", you mean the figure is too low and should be higher, I will admit that.

Q. Well, I was merely undertaking to elicit that fundamentally the figures shown on Schedule 3 of the amount ultimately to be recovered on the various assumed abandonment pressures, is predicated upon the correctness and accuracy of the original amount of gas which you stated to be 17,700 M. c. f. for Class 1 acreage and 5,000 M. c. f. for Class 2 acreage. A. That is correct.

Q. Incidentally, you could have avoided the necessity of deducting unmetered and metered production from original gas content if you had determined in the first instance the present amount of gas in the acreage by determining a weighted average rock pressure, could you not?

A. Except that I do not believe a true weighted average rock pressure could be determined.

Q. And that is why you went back to the original gas content in the field—

A. (Interposing) Yes, sir. I thought I could get a much more accurate figure as to the initial rock pressure, due to the fact that the variations in the original wells as to their initial rock pressure was much less than the variations in the wells at the present time.

As I stated this morning, the variation in those initial wells was 10 pounds one way or the other, whereas pres-

[fol. 4259] ently the variations in rock pressure throughout the field go through a range of 125 pounds or 150 pounds either way from the approximate average.

Q. Now, the 17,700 M. c. f. figure of original amount of gas, does not represent recoverable gas, does it? A. No.

Q. Now, I want you to convert that 17,700 M. c. f. figure to recoverable gas reserves per acre, based on a 50 pound abandonment pressure. You can calculate that for us, can't you? There is a machine on the desk.

A. Yes. Just a minute. There would be approximately 13,668 M. c. f. per acre.

Q. Have you taken off your recovery factor?

A. Yes, sir. I have just divided the figure appearing on Schedule 3, Page 2, Line 1, Column D, 417,500,896 M. c. f. by 30,546 acres.

The only other operation that I could do quickly here would be to divide the total number of acres into the figure appearing in Line 20, Column D of 618,997,998 by 65,429, but from that you would get an average of both Class 1 and Class 2 acreage.

Q. Well, you tell me if I am wrong, but I thought that what you would do would be to take your 17,700 M. c. f. and take first 85.8 percent of that—

A. (Interposing) It can be done that way.

[fol. 4260] Q. And then, take 90 percent of that.

A. It can be done that way.

Q. That is the figure I thought you would take.

A. I arrive at the same figure, 13,668.

. . . . . .

Q. Now, you have used the 90 percent recovery factor, have you? A. Yes.

Q. That figure would represent the original recoverable reserves per acre of Class 1 acreage, would it not?

A. No.

Q. Based on a 50 pound abandonment pressure?

A. That is the original amount before any production is withdrawn.

Q. Yes, that is what I mean, the original recoverable reserves, before any production had been withdrawn.

In other words, I was trying to get you to convert your 17,700 M.c.f. to recoverable reserves based on a 50 pound abandonment pressure.

Now, will you please make the calculation for the Class 2 acreage? In other words, convert the 5,000 M.c.f. to [fol. 4261] the recoverable figure based on a 50 pound abandonment pressure.

A. 3,861 M.c.f.

Q. For the Class 2 acreage?

A. For Class 2 acreage.

Q. Do you know what Mr. Ralph E. Davis' estimate of original recoverable reserves per acre for the West Panhandle Field was as made in this proceeding?

A. No, I don't.

Q. His estimate, as stated at transcript, Page 1529, was 18 million or 19 million feet per acre, which means 18,000 or 19,000 M.c.f. per acre, as compared with your 13,668 M.c.f. figure for Class 1 acreage and 3,861 M.c.f. for Class 2 acreage; would it be your testimony that Mr. Davis is wrong and that you are right?

A. He might be nearer right than I am.

Q. Now, will you please turn to Page 15 of your testimony in Exhibit 30, Mr. Smith? A. I have it.

Q. In the second paragraph on that page you make the following statements:

"Numerous qualified geologists have reached the conclusion that the average 'pay thickness' in the better portion of the gas producing area of the Panhandle Field is approximately 70 feet and the average porosity for such pay formation is approximately 20 percent. From [fol. 4262] these determinations they have estimated the average content in that area to be approximately 17.7 million feet per acre. I concur in that conclusion."

Is that your testimony?

A. Yes, sir.

Q. Who are these "numerous qualified geologists"?

A. Two of them are the two men who have been referred—previously, Mr. Cotner and Mr. Crum. Some others, to name a few, would be Mr. Thompson of Amarillo. I don't remember his initials.

Q. Is that T-h-o-m-p-s-o-n?

A. T-h-o-m-p-s-o-n.

Q. Would J. D. sound right?

A. I believe that is right, J. D. Thompson. And, Mr. Peterson—

Q. C. J. Peterson? A. Yes, C. J. Peterson.

Q. Anyone else?

A. I think Mr. C. Don Hughes has estimated the reserves in the Panhandle Field on this same method, using similar figures. I don't know of any other right offhand.

Q. On Page 17 of your testimony in Exhibit 30, the fourth paragraph, you make the following statement:

"It is recognized by geologists generally that based on an average sand thickness of 70 feet and an average [fol. 4263] porosity of 20 percent, the average original content in the better portion of the field was approximately 17.7 million feet per acre at virgin pressure. It is also recognized generally by geologists that the average original content in the poorer class of acreage (in which I include wells having less than 5 million cubic feet potential open flow at virgin pressure) was approximately 5 million per acre."

Are these "geologists generally" and "generally by geologists" the same gentlemen whom you have just named?

A. Substantially.

Q. Well, are there any others that you attribute this statement to?

A. There is another one, whose name I can't remember, that had worked particularly on the value assigned to the second-class acreage.

In that value assigned to second-class acreage I refer particularly to Mr. C. Don Hughes. All those men are of Amarillo, Texas.

. . . . . .

[fol. 4264] By Mr. Littman:

Q. Mr. Smith, we were discussing the numerous geologists upon whom you relied and to whom you referred on Pages 15 and 17 of your written testimony in Exhibit 30.

Now, those geologists did not make any tests to determine the porosity of the producing formation in any gas well in the Panhandle Field, did they?

A. I do not know positively. They certainly did a lot of studying in attempting to arrive at an average porosity figure for the field as noted in a footnote to the article referred to previously —

Mr. Culton: (Interposing) The Cotner and Crum article?

The Witness: I am going to that.

Mr. Culton: All right.

The Witness: Namely, the article written by Victor Cotnér and H. E. Crum, appearing in "Geology of Natural Gas" on Page 385, there in this statement:

"The following geologists have contributed material or criticism in the preparation of this paper, to all of whom the writers express their appreciation: L. M. Oles of the Prairie Oil and Gas Company; J. D. Thompson, Jr., Consulting Geologist; W. E. Hubbard of the Humble Oil and Refining Company; T. F. Newman of the Skelly Oil Company; Frank T. Clark of the Empire Gas and Fuel Company, and Richard W. Camp of the Consolidated Gas Utilities Company."

[fol. 4265] In addition to those, an article written about 1925 or 1926 or 1927 and published in the Bulletin of the American Association of Petroleum Geologists. This article was written by C. Max Bauer. He gave his idea of the porosity of Panhandle Field and, as I remember, substantiated his deductions by listing several cores which had been taken and porosity tests run on those cores.

By Mr. Littman:

Q. Do you know the names of the wells from which these cores were taken?

A. I believe it appears in the article mentioned. I have that article in the Kansas City office, and I will be glad to refer to it and give the names of those wells if they appear in the article.

Q. Do you recall what the porosity tests of those cores revealed?

A. If I remember correctly, the average was very close to 20 percent.

Q. Now, these gentlemen whose names you read in the footnote as having contributed material or criticism in the preparation of this paper, to what paper does that footnote refer?

A. The title of the paper is, "Geology and Occurrence of Natural Gas in Amarillo District, Texas", written by Victor Cotner and H. E. Crum.

[fol. 4266] Q. You do not know what particular material was furnished or contributed by those gentlemen whom you named, do you?

A. No, sir, I do not.

Q. You do not know whether those gentlemen contributed material related directly to this so-called 20 percent porosity figure or not?

A. No, sir, I do not.

Q. Then I take it from your testimony that you do not know the manner or method employed by these "numerous qualified geologists" in arriving at their porosity figure of 20 percent?

A. No, sir, I do not.

Q. And as you have stated, you have not made any independant investigation of your own in that respect?

A. That is true.

Q. Do you know what rock pressures these geologists used in arriving at this estimate of 17,500 M.c.f. per acre?

A. An initial rock pressure of 430 pounds well head.

Q. You know that each one used that?

A. Yes, sir.

Q. The pay thickness you have already described, have you not, with respect to their method?

A. Yes, sir, it was very close to 70 feet, perhaps 69½ or 71, but very close to 70 feet.

[fol. 4267] Q. You have never examined any of the working papers of these geologists, have you?

A. No, I have not.

Q. Isn't it a fact, Mr. Smith, that Cotner and Crum have never made any porosity tests?

A. I cannot say as to that.

Q. Did you rely upon a report written by them which appears in the American Association of Petroleum Geologists Bulletin?

A. I referred to that and that report possibly influenced my decision to use this method.

Q. And what is the date as of which that paper that you referred to was written?

A. It was originally published in August, 1933, and revised in 1935.

Q. And none of these geologists that you have mentioned have ever made any porosity studies or pay thickness studies with respect to the acreage controlled by Panhandle Eastern Pipe Line Company, is that correct?

A. Not as far as I know.

Q. Now, in order that I may understand your exhibit, I would like to have you explain the method used by you in arriving at the Class 1 and Class 2 acreage.

A. Exhibit 31, showing the initial open flow on a map of the Texas Panhandle gas field, the Class 1 acreage is that [fol. 4268] located in all the various classifications from 5 million cubic feet per day to above 40 million cubic feet per day.

The Class 2 acreage is that located in the classification below 5 million cubic feet per day.

Q. Now, your Exhibit 30 does not show the names of the particular leases which you classed as Class 2 and Class 1, do they?

A. That is true.

Mr. Culton: You said Exhibit 30. Did you mean 30 or 31?

Mr. Littman: I mean, his Exhibit 30. His written testimony and schedule. 31 is a map.

By Mr. Littman:

Q. Nor do your working papers show the list of acreage so classed?

A. No, sir.

Q. Do you have such a list?

A. No, sir, I do not. The reason I did not make such a list is because there is a very small amount of acreage in the Class 2 and, by comparison of the present acreage map with Exhibit 31, it can readily be determined which acreage lies in the Class 2 classification and, of course, the remainder lies in the Class 1.

Q. Now, the Class 2 acreage lies where with respect to the map, Exhibit No. 31 for identification?

A. In the gray area on Exhibit 31.

[fol. 4269] Q. You mean in the uncolored area?

A. No, the gray area.

Q. The gray area, within the heavy blue line, is that right?

A. Yes, sir.

Q. Do the various lines of demarcation, as indicated by the coloring on this map show the lines of demarcation with respect to the various open flows within each color class?

A. As shown by the legend here, the wells having an open flow above 40 million are in the areas colored yellow.

The wells have open flows from 25 to 40 million are in the areas colored green.

The wells having open flows from 10 to 25 million cubic feet per day are located in the areas colored red.

The wells having open flows from 5 to 10 million cubic feet per day are in the areas colored blue, and the wells having open flows below 5 million are in the areas colored gray.

Q. Thank you. Did you prepare this map, Exhibit No. 31 for identification?

A. It was prepared under my direction.

Q. Who originally prepared it?

A. Mr. C. Don Hughes.

Q. He is a geologist of Amarillo, Texas, is he?

A. That is true, a consulting geologist.

Q. And you made some changes in respect to the or-

[fol. 4270] iginal Map which was prepared by him?

A. A few minor changes.

Trial Examiner: The basic map is a commercial map, isn't it?

The Witness: No, I do not believe it would be called a commercial map. It was one which Mr. Hughes supplied me, loaned me, you might call it.

By Mr. Littman:

Q. What, if anything, did you personally have to do with the determination of the open flows that appear on this map?

A. You mean in testing the wells?

Q. No, I meant whose data is reflected on this map?

A. The data taken from official Railroad Commission tests.

Q. Was it taken by Mr. Hughes or by yourself?

A. It was taken by neither of us.

Q. I do not mean the original test that was taken. I mean, who actually decided where the colors were to go and what particular areas were to be included within the 40 million cubic feet class and the 25 to 40 million cubic feet class, and so forth?

Trial Examiner: In other words, who laid out the boundary lines of the pressure zones?

The Witness: Mr. Hughes did originally, and I spot [fol. 4271] checked the map by reference to records I had of the initial open flow of various wells, and where I found inaccuracies in Mr. Hughes' map, I made revisions.

By Mr. Littman:

Q. Did you make a check of the original data from the original source which was the Texas Railroad Commission?

A. The figures that I used were tests from the Railroad Commission of the initial open flow of these various wells.

Q. Now, do you know, as a matter of fact, that all the wells included within the blue area, for instance, which is classed by you as 5 to 10 million cubic feet are, in fact, wells that do not exceed 10 million and do not go under 5 million?

A. Generally speaking, yes. By generally speaking, I mean this: That I spot checked it. I did not check every single well whose location appears on this map, but I did check at random wells which appear on the map, to determine in a general way whether or not these lines were accurate.

Q. Well, it is a fact, is it not, that some of the blue areas contain wells whose open flow exceeds 10 million cubic feet?

A. That could be true.

Q. In other words, you did not undertake by this map to be so exact as to exclude all wells beyond and below the amounts shown for each class?

[fol. 4272] A. I did not include any wells in an improper classification on here that I found to be in an improper classification.

Mr. Culton: Did you check all of the Panhandle Eastern's wells?

The Witness: I did check all of the Panhandle Eastern's wells in regard to this classification.

By Mr. Littman:

Q. You do not show the open flows of the individual wells anywhere in your exhibits from which data on this map was made?

A. No.

Trial Examiner: May I ask, Mr. Smith, what publications are currently issued by the Texas Railroad Commission with reference to the Panhandle Field?

The Witness: Annual Reports are issued which contain summaries of activity in the Panhandle oil and gas field during the year subsequent to the issuance of the Reports.

Trial Examiner: You mean, the year preceding?

The Witness: The year preceding the issuance of this Panhandle oil and gas field report.

Trial Examiner: How long has it been customary to issue such reports?

The Witness: I believe, since about 1936.

[fol. 4273] Trial Examiner: We had in this hearing the series of reports since they began to issue them [would] it did not give us a great deal of official data with reference to development of the field as a whole?

The Witness: Yes, sir.

Mr. Culton: Mr. Examiner, I do not know whether those are all available or not. If they are not at the Commission's office, I happen to have a personal file, I think, of every one that has been issued, and I will be very glad to make them available to the Commission.

Trial Examiner: I think we might appreciate that, Mr. Culton. Of course, it is not my thought in making the suggestion that any great part of it would be incorporated into the evidence, but there might be some part that will be material to incorporate into evidence, and it would be advantageous if we might all have them for reference during the further hearing.

Mr. Culton: The Commission probably has a set. Claude Brown, I know, had a set several years ago, and I assume the Commission probably has received those issue in the last two or three years, but I will see to it that do have a set available in this case for any use a[t] ie desires to make of them.

Mr. Gorman: May I inquire whether that is the general report of the Railroad Commission, or is that a specific [fol. 4274] report on the gas field?

Mr. Culton: That is their annual Panhandle Field Report.

Mr. Gorman: I think we probably have that in our library, Mr. Examiner.

Trial Examiner: Do you know whether the Commission issues any other periodic reports relating to this field and, if so, what they have been to date?

The Witness: They issue annual schedules of the tests on all wells in Panhandle Field, setting forth the open flow potential of the well for that year, the rock pressure and the proratable acreage under that well, together with the location and number and company owning the well.

That is done once each year. From time to time, they also issue other reports, not regularly, however, which summarize these annual open flow and rock pressure schedules.

Trial Examiner: Is a license for drilling required to be filed which is followed by the filing of the log of the wells now being drilled?

The Witness: Yes, sir.

Trial Examiner: So the Commission has logs of all wells?

The Witness: They have attempted to get logs of all wells and they have, I think, 99 percent of them.

Mr. Culton: I will say, Mr. Examiner, until a few years back, there was no requirement that those logs be filed with the Commission but, for a few years, it has been a require- [fol. 4275] ment to have the logs filed with the Commission.

Trial Examiner: And that has enabled you to check and have fairly reliable data?

Mr. Culton: On all wells that have been drilled in recent years, logs are available, I think.

I have known of a few instances, and one of them relates to one of our gas purchase wells, it is one of the Navajo wells—

Trial Examiner: Some of these records of the Railroad Commission might be of considerable use to us, and I wanted to ask further whether they also require reports on abandonment.

The Witness: Definitely, they do.

Trial Examiner: And do they issue those reports, or are they included in any publication they issue?

The Witness: In the back of this 1940 Report, there is a section devoted entirely to wells having been abandoned during the past year.

Other reports contain similar information of that kind.

Trial Examiner: Do the maps and charts included in these annual reports indicate the field extensions?

The Witness: To a certain extent, but it is not very accurate, Mr. Examiner, because they are on such a small scale.

Trial Examiner: But the basic data is doubtless included?

The Witness: Yes, sir.

[fol. 4276] Mr. Gorman: I wonder, Mr. Examiner, as a matter of general information if you would be interested in having Mr. Culton or Mr. Smith give you a short, general summarization of the proration law which is in effect in Texas, which might indicate to you the information which the Railroad Commission does require of producers in that State?

Mr. Culton: I can give it in about one sentence.

Trial Examiner: It would be very much appreciated, and I think it is also material.

Mr. Culton: There is a proration law in Texas applying to sour gas. There is no proration law in Texas applying to sweet gas, that law having been held to be invalid by the Supreme Court of the United States in so far as the sweet gas is concerned, in a case in which I participated.

The opinion was written by Justice Brandeis.

Trial Examiner: What was the case?

Mr. Culton: Thompson versus Consolidated Gas Utilities Corporation, decided about January, 1936, or 1937 in the Supreme Court.

Trial Examiner: Do you have the citation?

Mr. Culton: No. I have lost track of the notices of the Law Edition, but I think it is the 83d Law Edition. We can get the exact citation and we will be glad to furnish it in the record.

Trial Examiner: That does not, however, necessarily [fol. 4277] represent the law as pertaining to this particular problem.

Mr. Culton: I just started to remark, Mr. Examiner, that although it is not required by any proration law, there are other statutes giving the Railroad Commission of Texas general supervision over the drilling and operation of both oil wells and gas wells, including authority to the Railroad Commission to promulgate regulations with respect to drilling, producing and abandoning all of those wells.

In compliance with that statutory provision, the Railroad Commission of Texas has promulgated rather a large number of rules dealing with those subjects, and those rules are at this time, and for several years past have been, pretty well followed in the Panhandle of Texas.

The Witness: Mr. Culton, isn't there one provision which restricts the production to 25 percent of the open flow?

Mr. Culton: The law restricts the production to a maximum of 25 percent of the open flow, but that is not a proration proposition. That is an absolute maximum production.

The properties of Panhandle Eastern Pipe Line Company are all located in the sweet gas area, so the proration regulations of the sour gas area do not apply to any of Panhandle Eastern's wells.

For several years past, the Commission has adopted the policy of taking these tests every summer in the Panhandle, the tests of the potential producing capacity of the wells [fol. 4278] and the tests of the existing pressures.

These field boys can check me on this, but I think they have done that every year for several years.

Have they skipped a single year?

The Witness: No, I do not think so.

Mr. Culton: I think that they have made those tests every year. It is quite a job. They have quite a good many different men employed in it, usually getting boys who are taking courses in petroleum engineering at the different schools and universities in the State.

The Witness: As a matter of fact, for one or two years, they took two tests during the year. I think another thing might be added, and that is the fact they changed their method of testing last year from the pitot tube method to the back-pressure method.

Mr. Culton: That is for testing open flow capacities.

The Witness: Open flow capacities, and also they require that no more spring gauge rock pressure tests be made but all rock pressure tests be made with dead weight gauges.

Mr. Culton: All those changes tend to make more certain the results attained. That is, that character of test is likely to be more consistent than other types of tests.

The Witness: They will be very much more consistent and also will indicate more nearly that which the open flow test pretended to indicate. By that I mean, the ability of [fol. 4279] the well to produce.

. . . . . .

[fol. 4280] By Mr. Littman:

Q. What character of open flows are reflected on your map, Exhibit No. 31?

A. All pitot-tube open flows.

Q. Are they the original open flows or the open flows at some dates after the original drilling?

A. They are original open flows, initial open flows.

Q. They are the initial open flows?

A. Yes.

Q. At what rock pressure?

[fol. 4281] A. At the rock pressure at the time the well was drilled.

Q. Isn't it a fact that that map purports to represent a conversion of these open flows to a 430-pound rock pressure?

A. That is true. My first answer was incorrect. They are converted to the initial rock pressure of the field.

Q. I am sorry, but I did not quite get the last part of your answer. Suppose you explain the conversion and what this map actually shows with respect to the open flows?

A. It shows the initial open flows of the wells drilled throughout the field, corrected to the initial rock pressure of the field of 430 pounds.

Q. And who made the calculation with respect to the correction?

A. Mr. Hughes.

Q. Do you know how Mr. Hughes made that calculation?

A. Not exactly, no. I presume it was made by direct proportion that if the present pressure is 400 pounds and the open flow is 10 million, then the initial open flow would be 430 over 400 times 10 million.

Mr. Culton: Is there a Bureau of Mines correction factor applied, or do you know about that?

The Witness: It probably was. I do not know for sure.

By Mr. Littman:

[fol. 4282] Q. Well, isn't it a fact that Mr. Hughes used what is known as a type curve to convert these open flows to 430 pounds rock pressure?

A. That is right.

Q. Would you mind stating now what the fact is with respect to how Mr. Hughes determined the open flows?

A. I am not entirely familiar with that curve. However, I do know he used that curve in making his corrections to the initial pressure.

I do not know the mathematical operation through which he went to make the correction.

Q. Do you, of your own knowledge, know whether the curve utilized by Mr. Hughes was a proper curve for the purpose?

A. It seems to me that it was a curve in a publication by the Bureau of Mines. I am not sure of that.

Q. Isn't it a fact that the curve was based on the wells of Texoma?

A. I do not know.

Q. You do not know whether it was based on 1943 of Texoma Company wells, do you?

A. I do not know.

Q. Well, at any rate, you then utilized this map for the purpose, among other things, of arriving at your Class 2 acreage which had an original gas content of 5,000 M. c. f. per acre?

[fol. 4283] A. Yes, estimated.

Q. Why do you use the 5 million open flow basis of determining this Class 2 acreage? What relation does that have to the amount of gas in that acreage?

A. That is just an estimated figure, that it would be approximately that.

Trial Examiner: Isn't this merely a reclassification of your lands in the light of drilling experience?

The Witness: To a certain extent, Mr. Trial Examiner, the marginal acreage, in my opinion, would be much below the more prolific acreage and the classification merely divides it between the marginal and the average or above-average of the field.

For that reason, I selected the 5 million per acre as an approximate figure for the marginal acreage.

By Mr. Littman:

Q. It isn't a very good reason, is it?

A. No, it is not.

Mr. Culton: How many acres are involved?

Trial Examiner: It is small.

The Witness: 1,920, three sections.

By Mr. Littman:

Q. Out of a total of how many acres?

A. 65,429.

[fol. 4284] Trial Examiner: By the way, there is one question I want to ask you that I forgot.

Has the United States Bureau of Mines made any extensive investigation of the Panhandle Field and issued publications based on their study?

The Witness: I am not familiar with them. I am sorry.

Trial Examiner: You do not know of any?

The Witness: No, I do not.

Mr. Culton: I have not seen any, and Dr. Bartle, who watches that closely in his line of work, informs me he has seen none.

Trial Examiner: There would be no other Governmental agency that would have studied that?

Mr. Culton: That is right.

By Mr. Littman:

Q. Mr. Smith, you cannot tell how much gas is contained in an acre by looking at the open flow, can you?

A. No.

Q. Am I correct in understanding—I might say that I have learned what little I know about this very recently—that the open flow merely tells you something about the ability of a well to produce gas?

A. From a relative standpoint. That is, if a well has an open flow of 5 million cubic feet per day, and another well has an open flow of 25 million cubic feet per day, you [fol. 4285] will conclude from that that one will produce about five times as much as the other in one day.

Q. That is, it is a function of time, is it not?

A. Yes, sir.

Q. Rather than amount of reserves. Open flow has to do with permeability, has it not?

A. A great deal.

Q. Another way of stating it is, it has to do with conductivity?

A. The ability of the gas to pass from its initial place into the well bore.

Q. That is right. In other words, if you had nothing before you other than an open flow reading, no matter how correct that reading may be, you could not estimate from that open flow the content of the gas in any particular acre, could you?

A. I think not.

Q. Then your estimate of this Class 2 acreage was not, in fact, based upon any given porosity or any given sand thickness, was it?

A. No, sir.

Q. That so-called porosity method holds true only for the Class 1 acreage?

A. That is true.

Q. And as you have indicated, there was not very much [fol. 4286] Class 2 acreage?

A. That is true.

Q. Approximately 1,700—

A. (Interposing) 1,920.

Q. 1,920 acres, and you did not use the open flow figures at all in estimating your reserves for the Class 1 acreage, did you?

A. No, sir.

Q. Now, I would like to have you explain for us, in theory, the porosity method of determining gas reserves. I want you, Mr. Smith, to assume a given area, let us say, one acre, and I would like to have you tell us what measurements you would have to have in order to determine exactly how much gas is in the hypothetical acre.

A. I would have to know the porosity of the producing formations.

Mr. Lee. May I bother you just a moment there. Would you mind defining that term "porosity"?

The Witness: Porosity is the percentage of void space in a unit volume of formation.

Mr. Gorman: Is that an open space as distinguished from solid matter?

The Witness: That is true.

Mr. Littman: Let me ask you, if we had a box full of ping-pong balls, the spaces between the balls would repre- [fol. 4287] sent the porosity of that container, would it not?

The Witness: That is true.

Mr. Lee. Well, may I just ask another question, from the standpoint of a man in the street trying to get some knowledge of the subject?

The Witness: Certainly.

Mr. Lee: Does the open space within the given area—how does that become a yardstick or a standard of measurement as applied to the probable capacity of the well, and I will go just one step further, is it because in that open space there is an area for the gas?

The Witness: Which is favorable for the accumulation of gas.

Mr. Lee: Repeat that—which is what?

The Witness: Which is favorable for the accumulation of gas. There is a reservoir in that formation.

By Mr. Littman:

Q. In other words, Mr. Smith, if you had a very hard granite, the porosity of the granite would be zero, would it not?

A. As a usual thing, granite has no porosity. It is very dense. There is no pore space in there. There are no voids.

Q. And; therefore, it cannot be expected to hold gas or anything else?

[fol. 4288] A. That is true.

Q. That would be the zero extreme, would it not?

A. That would be the zero.

Q. And if you have a cavern in the ground, that would represent 100 percent porosity because every cubic foot of the cavern could hold gas?

A. That is true.

Q. Now, will you please give us the theory of the porosity method? We have a theoretical, hypothetical acre, and we want to know exactly what we would have to have in order to determine precisely how much gas is under that acre.

A. We would have to have the percentage of porosity.

Q. Of every cubic inch of producing sand in that acre? I am talking about theory now, Mr. Smith.

A. Theoretically, yes, for an absolute determination.

Q. That is right.

A. We would have to have the thickness of the formations which contained this porosity, the exact thickness.

Q. And which contains the gas?

A. Down to the millionth of an inch.

Q. That is right. What else would you have to have?

A. We would have to have the pressure of the gas in that void space under this acre at every point, every square centimeter of the acre.

[fol. 4289] Q. The weighted average—

A. (Interposing) No, we would have to know the uniform pressure.

Q. And that is, of course, because this sand will contain more gas if it is compressed?

A. That is true.

Q. And thereby, a greater pressure?

A. That is true. We would have to know whether that pressure is the same at the top of the producing formation as it is at the bottom of the producing formation, which it probably is not.

We would have to know all about every cubic centimeter or millimeter of the producing formations under that acre of ground. Of course, that is absurd. It is an impossibility.

Q. Well, perhaps I should not have taken an acre, perhaps I should have taken a given container and propounded my hypothetical question because I wanted to make certain that I understood the theory of the method.

At any rate, the more accurate your information in regard to (1) porosity; (2) thickness of sand and (3) pressure, of course the more accurate your estimate of reserves, is that true?

A. That is true of every problem. The more accurate your information the more accurate your result.

[fol. 4290] Q. Now, nobody knows, as a matter of fact, what the porosity is of the Panhandle Field or any other field, do they?

A. That is right. Until the field is finally produced, the last drop of gas is taken from it, then—

Q. (Interposing) Then it is too late.

A. It is too late; and you would also have to know exactly the thickness of all of those pay formations then.

Trial Examiner: While you are on that, haven't you had any outcrops of any of these formations?

The Witness: The outcrops would not show any porosity, Mr. Examiner.

Trial Examiner: No information can be gained that way, then?

The Witness: Not as to percentage of porosity, no, sir, because if there was porosity and permeability in the outcrop, the gas would have escaped probably ages ago.

Trial Examiner: I was thinking of the geological formations themselves.

The Witness: These formations do outcrop and the outcrops have been studied.

Trial Examiner: That is what I had in mind. Isn't that your starting point in estimating porosity in the ground?

The Witness: No, sir.

Trial Examiner: Where you have that?

[fol. 4291] The Witness: No, sir.

Trial Examiner: In comparing your own formation of the outcrop with the cuttings from the wells, isn't that the method used?

The Witness: That is our method of correlating the geologic age of the formation from which the gas is produced but it would not contribute to our knowledge of the formation where the gas reservoir exists.

Mr. Culton: In that connection, Mr. Examiner, I happen to have some photographs taken of the outcrops of the Granite Wash in Oklahoma.

The worst trouble about them is that I happen to be shown in some of the photographs—I am the straw man—I also have some samples of Granite Wash taken out of the outcrop in the different stages of decomposition.

I shall bring a set over and let the Examiner look at them tomorrow and I will bring some samples of the Granite Wash in different stages of decomposition when I come back from Amarillo.

I can appreciate that the Examiner has a little curiosity about those, just like I did.

By Mr. Littman:

Q. Now, you have already testified that, in order to determine the porosity accurately, you must have cores tested in the laboratory, have you not?

[fol. 4292] A. Yes. Even then you would not have exact figures.

Q. But if you want to come even close, you have got to take the cores out and test them in the laboratories, isn't that right?

A. Yes.

Q. And cores, as such, have never been taken from the true producing sand in the Amarillo Field, have they, as far as you know?

A. I won't say that. I would say that probably the cores have not been taken from all of the producing formations in the Amarillo Field, but when you say true producing formations, I do not agree.

Q. By "true," I meant the more highly productive.

A. That is probably true.

Q. In other words, when you do get a core, you get about the worst part of the pay sand, do you not?

A. The part contributing the least gas.

Q. By reason of the fact that it will hold together since it is not very porous?

A. That is true.

Q. And then, after you get the core out and you do look at it and you know, in the first place, that it does not represent the most representative portion of the pay sand and after you do make laboratory tests of it, well, then what do you have?

[fol. 4293] A. You have the porosity in a very limited area.

Q. In other words, you then know the porosity?

A. Of the cores.

Q. Of the core that you have, and you cannot testify nor can anyone else testify, as to the porosity one foot or two feet away, isn't that right?

A. That is true. That is one reason why we apply that 90 percent of recovery factor, because of the variable condition of the reservoir, that the porosity is one thing one

place and another thing another place and, consequently, all of the gas can never be gotten out of the reservoir because permeability does not exist which is favorable to getting the gas out of the reservoir.

Q. It might be 10 percent up, rather than 10 percent down, might it not?

A. It might.

Q. But your estimate reflects the downward trend wholly and solely, does it not?

A. My estimate, as I said several times, is conservative.

Q. Well, now that we have discussed porosity—incidentally, you do testify, do you not, that great variations are found as to porosity throughout the entire field, the Panhandle Field?

A. Absolutely, from zero to 100 percent.

[fol. 4294] Q. And you have offered in evidence a number of exhibits that demonstrate that fact, have you not?

A. Yes, sir.

Q. And those exhibits are two sand graphs which I think are designated as Exhibits 28 and 29 which show the situation with respect to 34 wells, is that correct?

A. That is right.

Q. And, as a matter of fact, you say at Page 16 of your written testimony, do you not, that:

"These graphs clearly demonstrate that the productivity of the wells does not always increase in the same proportions as it increases in aggregate pay thickness which necessarily means that in the different pays encountered, varying percentages of porosity exist."

Is that your testimony?

A. That is right.

Q. Then the next thing you have to have to be accurate is a good determination of the thickness of pay stratum or strata, is that right?

A. That is right.

Q. You cannot be very sure about that either, can you, Mr. Smith?

A. No, you cannot.

Q. As a matter of fact, there are great variations throughout the Panhandle Field in thicknesses of pay, are there not?

[fol. 4295] A. That is correct.

[fol. 4301] RUFUS M. SMITH a witness, having been previously sworn, resumed the stand and testified further as follows:

Cross-Examination (Continued)

By Mr. Littman:

Q. Mr. Smith, at the close of yesterday's session, we were discussing the "numerous qualified geologists" referred to by you on Page 15 of your written testimony in Exhibit 30, and "geologists generally" referred to by you in your testimony on Page 17 of that exhibit.

Also, we were discussing the average thickness of the producing sand, commonly called "pay thickness" in the Panhandle Field.

Now, it goes without saying, does it not, Mr. Smith, that the thicker the pay sand, the higher the estimate of gas reserves by your method. Is that correct, generally.

A. That is true, providing the porosity remains the same throughout the thicker section. Assuming that the porosity is uniform, it would naturally follow that you would have a greater content of gas in the thicker pay section.

Q. Well, if you had used an average sand thickness in excess of the thickness which you did use of 70 feet, then [fol. 4302] under your method you would have estimated a higher gas reserve content, would you not?

A. That is true, if I still used the 20 percent porosity.

Q. Yes, and you did use the 20 percent porosity, did you not?

A. Yes, sir.

Q. Now, I believe you stated yesterday that one of the geologists upon whom you relied was a Mr. C. J. Peterson, is that correct?

A. I had read some of the results of some of his studies.

Q. And did he arrive at the conclusion that the average pay thickness was 70 feet?

A. Approximately that thickness.

Q. Now, he is then one of the authorities upon whom you relied for the purpose of using the 70-foot average pay thickness, is that correct?

A. That is correct.

Q. Mr. Smith, do you know to what field or fields this 70-feet pay thickness of Mr. Peterson's applied?

A. The West Panhandle Field.

Q. I take it from your answer, that it is your understanding that Mr. Peterson's 70-feet average did not embrace the area commonly known as the East Panhandle Field?

[fol. 4303] A. That was my impression.

Mr. Littman: If your Honor please, I think Exhibit 76, which was presented by Mr. Davis, contains a map of the Texas Panhandle Field that might be helpful for our purposes, inasmuch as it is a fairly small and concise map, and I would like to make reference to it now.

By Mr. Littman:

Q. As I have just stated, Mr. Smith, this is one of the maps presented in Exhibit 76 by Mr. Davis. Does the map, so far as you can observe it here before you, correctly show the general outline of both the West and East Panhandle Field?

A. Generally, speaking, yes.

Q. Now, will you please point out for us on this map the line of demarcation between the so-called West and East Panhandle fields?

A. The line of demarcation between the West and East fields is a line approximately the center of Gray County, running north and south.

Q. Now, Mr. Davis has shown on this map the general location of the leaseholds of Panhandle Eastern Pipe Line Company, and those of the gas vendors in red and green blocks.

Does Mr. Davis' colors showing that acreage coincide, generally, with your understanding of where the acreage is [location]?

Mr. Culton: That is what year?

[fol. 4304] Mr. Littman: July, 1939.

The Witness: There have been probably some revisions since that time of a minor nature, but since the map is

rather small-scale, I can only say that it is approximately the location of the various blocks of acreage owned or controlled by Panhandle Eastern Pipe Line Company.

By Mr. Littman:

Q. Yes. Mr. Smith, I do not propose to hold you exactly to these blocks, but I did want to use this map for our purposes here because it is small and does show the entire picture on one small page.

What I am getting at specifically is, Panhandle Eastern does not hold or control any acreage in what is known as the East Panhandle Field, does it?

A. That is correct.

Q. And, as a matter of fact, does not own or control any acreage for a considerable distance to the west of the line of demarcation between these two fields, does it?

A. That is correct.

Q. Can you tell me approximately the distance between the line of demarcation between the East and West Panhandle fields and the point at which Panhandle Eastern's acreage commences in the West Panhandle Field?

A. I would estimate it to be 35 or 40 miles.

Q. And, as a matter of fact, the bulk of Panhandle [fol. 4305] Eastern's acreage is located even further west of that line than the 35 miles, is it not?

A. Yes.

Q. Now, am I correct in understanding that Panhandle Eastern's acreage is located, that is, in the Panhandle Field, generally in the southern portion of Moore County, in the northern portion of Potter County, in the northwestern portion of Carson County, and some in the extreme southwest section of Hutchinson County, is that correct?

A. That is correct.

Q. There is a little acreage in what is known as Hartley County, but that is rather insignificant, is it not?

A. Yes, sir.

Q. Now, is it not a fact, Mr. Smith, that the pay thickness in the East Panhandle Field is considerably less than the thickness in the West Panhandle Field?

A. I believe the average pay thickness in the East Field is less than the average pay thickness in the West Field.

Trial Examiner: While you are discussing the West Panhandle Field, referring to Davis' map contained in Exhibit 76, I wonder if you can give us a statement about the other major producers of gas adjacent to the Panhandle properties in the locations which you have designated?

The Witness: You mean by that, Mr. Trial Examiner, the names of those companies?

[fol. 4306] Trial Examiner: Yes.

The Witness: In Carson County, Cities Service has considerable acreage adjacent to Panhandle Eastern acreage.

Mr. Culton: Where does that line go to? The Examiner would probably like to know in connection with each of those companies, roughly where the line goes to, I assume.

Trial Examiner: Yes. Of course, it is evident from this map that you have a possibility, in view of your location, of a sharply competitive situation, and I thought this would be a good time to develop the nature of that possibility.

The Witness: The Cities Service line goes from their leases in Carson County, generally speaking, through Oklahoma, Kansas, their largest market being served, I believe, is Kansas City, Missouri.

Trial Examiner: I am not thinking of that Mr. Smith. I would just like to know the names of the companies that occupy the area disclosed by this shaded portion of the map in Exhibit 76, in a general way without too much detail, confining your statement to what you have described as the West Panhandle Field.

The Witness: In addition to the Cities Service, the Texoma Gas Company holds leases in the same section of Carson County where Panhandle Eastern's acreage is held.

Trial Examiner: May I ask, is that production designed for the Denver market or some other market, just a broad notation.

[fol. 4307] The Witness: Texoma is designed for the Chicago market, I believe.

Trial Examiner: Just state, generally, what the market is, and proceed.

The Witness: In addition to that, Texoma has acreage adjacent to Panhandle Eastern's acreage in southern and central Moore County.

Canadian River, whose lines go to Denver, holds acreage adjacent to Panhandle Eastern's acreage in northern Potter County and [southerwestern] Moore County.

In Hutchinson County, Panhandle Eastern's acreage is adjacent to acreage which supplies gas to various carbon black plants.

Trial Examiner: That is getting on the edge of the sour gas, is it not?

The Witness: Yes.

In central Moore County, Panhandle Eastern's acreage is adjacent to Phillips Petroleum acreage, Shamrock Oil and Gas Corporation acreage, which serves gasoline plants and carbon black plants in Northern Moore County.

I believe that is generally the picture.

Trial Examiner: Thank you.

Mr. Culton: Did you give the picture for the Canadian line to Denver?

[fol. 4308] The Witness: Yes.

Mr. Culton: And also the South Plains line?

The Witness: I did not give the South Plains line.

Mr. Culton: It is just the same acreage. The same acreage serves South Plains and the Denver line.

The Witness: And Red River also comes in that category, and the West Texas Gas Company also comes in the same category.

I do not know just where those [line] go to. Perhaps Mr. Culton could clear that up.

Trial Examiner: That is gas produced by which company?

The Witness: It is in the same picture as the Canadian River Gas Company.

Mr. Culton: Points on the South Plains.

The Witness: Numerous small communities.

By Mr. Littman:

Q. Mr. Smith, can you state what markets are served from the East Panhandle Field, generally? The Lone Star Gas Company is one of the companies that takes gas from Wheeler—

A. (Interposing) Lone Star, Shamrock Oil and Gas Corporation has some acreage over there in the East Field.

I believe Cities Service has some acreage over there in the East Field. There are a number of smaller companies which have acreage over there. A great deal of it, as I understand, is used for serving gasoline plants.

[fol. 4309] I do not know of any long-distance pipe lines which go from the East Field.

Mr. Culton: Consolidated goes to Wichita?

The Witness: Consolidated Gas Company goes to Wichita, Kansas.

Mr. Culton: And Lone Star and United. Have you ever done any work in the East Field at all?

The Witness: No, I have only kept track of the East Field in a very general way.

Trial Examiner: Is the Chicago area served at all from the West Panhandle Field, Mr. Smith?

The Witness: Entirely.

By Mr. Littman:

Q. Mr. Smith, do you have with you the article written by Mr. C. J. Peterson upon which you relied and to which you referred yesterday? A. No, I do not.

Q. Mr. Smith, I hand you a photostatic copy of a paper entitled, "Details of Data Used in Exhibit No. 43; C. J. Peterson, Witness as Requested by Federal Power Commission.

"I. List showing Areal Divisions and Name, Location and Thickness of Gas Pays in 627 Gas Wells Used in De-

termining Average Weighted Thickness of Gas Pay in Best Commercial Gas Area—Texas Panhandle. Pages 1 through 26.

[fol. 4310] "H. Explanation and Calculation of Weighted Thickness of Gas Pay Per Acre—In Best Commercial Gas Area, Texas Panhandle Field. Pages 27 and 28."

A photostatic copy of Mr. Peterson's Exhibit No. 219 in the case commonly called the Canadian River Case which was heard by the Federal Power Commission in the past year: I hand you this exhibit.

Mr. Culton: We offer it in evidence without having read it.

Mr. Littman: Let's talk about it a little bit, first.

By Mr. Littman:

Q. Now, I believe you will find on Page 28, a summary of the various pages of that exhibit, and at the foot of that page, you will note that Mr. Peterson has the following: "70 feet used." Do you see that? A. Yes, sir.

Q. Now, I want you to look at that summary page and the rest of the exhibit, and tell me whether or not Mr. Peterson did, in fact, arrive at that 70 feet of pay thickness by averaging in the pay thickness of the East as well as the West Panhandle Field.

A. Apparently he did.

Q. And that is contrary to the understanding which you had a few minutes ago, is it?

Mr. Culton: This witness has not said he has ever seen [fol. 4311] this instrument before.

The Witness: This is the first time I have ever seen this. I did not know it existed, in fact.

However, we have not any quarrel about the pay thickness of the West Panhandle Field.

I have repeatedly said that my 70-foot figures which I used for the pay thickness was very probably low, less, if anything, than the actual pay thickness.

By Mr. Littman:

Q. Well, the 70 feet that you used would more nearly represent Mr. Peterson's conclusion with respect to the

thickness of the entire Panhandle Field, both West and East, is that right?

A. Apparently, from the exhibit which you have just shown me.

Q. And that is contrary, is it not, to the understanding that you had of Mr. Peterson's conclusions a moment ago, when you said, I believe, that Mr. Peterson's pay thickness of 70 feet was based upon the West Panhandle Field?

A. Well, perhaps Mr. Peterson has revised his idea. The material to which I referred was not this material and I am reasonably sure that the material to which I was referring stated that he considered 70 or 72 feet as the average of the west Panhandle Field.

Q. That is, of course, contrary to what you see before [fol. 4312] you here?

A. That is true, but he may have revised his opinion or done further work and further study and got different results.

Q. Well, do you know the date of Mr. Peterson's article, the one to which you just referred a moment ago?

A. I believe it was about 1939, the one I was referring to.

Q. Then the revisions that Mr. Peterson made, as reflected in his Exhibit in the Canadian River Case—

A. (Interposing) Would have been made in the last two or three years.

Q. And you were not aware of these revisions?

A. I was not.

Q. Now, referring to Page 28 of Mr. Peterson's exhibit it is obvious from that page which [summaries] the data appearing in the first 26 or 27 pages of that exhibit, that the average pay thickness in the sweet gas area of the West Panhandle Field is greater than the 70 feet average for the entire Panhandle Field, both East and West?

Mr. Culton: Just a minute. I have not seen that, but I am willing to say that counsel is misquoting it. Doesn't he say that that is the better part of the Panhandle Field? It doesn't say the field as a whole.

"In the best commercial area of the Texas Panhandle Field."

[fol. 4313] It doesn't say the entire field. He is just selecting the best part of it for that computation.

Mr. Littman: Yes, the best commercial gas area of the entire Panhandle Field, both West and East, is that correct?

The Witness: That is what it says.

By Mr. Littman:

Q. And your Class 1 acreage represents all except, I believe, 1900 acres of Panhandle Eastern's acreage?

A. That is true.

Q. Also in the best commercial area, is it not?

A. It includes considerable of the mediocre, but not the poorest. My second classification is only the poorest acreage, but my No. 1 classification includes the best and the mediocre acreage, if you would break it down into three classes.

Q. Well, do you know what Mr. Peterson means when he refers to "best commercial gas area"?

A. I would assume that he means the area from which the greatest per acre return will be gotten.

Q. But you did not make any investigation of what he meant? A. No, sir, I did not.

Q. But you did use his average pay thickness?

A. From a former article.

Q. I do not remember which you answered the question [fol. 4314] that I put to you a moment ago about Page 28, or not. I shall ask it again.

A. Will you read the question again?

Q. Suppose I just ask it again. It is obvious from Page 28 of Mr. Peterson's exhibit that his average pay thickness for the sweet gas area in the West Panhandle Field is greater than that of the average of the entire Panhandle Field, both East and West, is that correct?

A. As shown on here, that is true. However, he is not including the same area to which I have referred, but only the best portion, I will say, of the Class 1 classification which I used.

Q. You do not know that of your own knowledge, do you?

A. I have to assume, because I have not read this in detail.

Q. Now, he has listed the wells he used for the purpose of determining these pay thicknesses from Pages 1 to 26, inclusive, and I think you will find them listed in there by counties. Suppose you look at those wells and satisfy yourself on that point.

By the way, I think you will find a considerable number of Panhandle Eastern's wells listed there.

A. From hastily looking over this, I still believe that he selected the best gas producing area out of the West producing field for his consideration.

[fol. 4315] Q. He used 307 wells in the West sweet gas area of the Panhandle Field, did he not?

A. Yes, sir, which is less than half of the wells in the West sweet area. The Railroad Commission Report of July 1940 states at that time there were 752 wells in the West sweet area.

Q. And which is over seven times more wells than you used?

A. That is right. However, I was only considering Panhandle Eastern acreage.

Q. And you would have used more, of course, if you had been able to get the data but you could not because the well logs were not adequate for that purpose?

A. That is true. I used the best information I had.

Q. Will you state what the average pay thickness would be in the sweet gas area of the West Panhandle Field by the use of Mr. Peterson's data?

A. If these pencil figures are correct, apparently the average thickness in the sweet gas area of the West Field is very close to 78 feet.

Q. Now, I might say, Mr. Smith, you are at liberty to check our figures on these at any time and make any corrections that you wish. A. Thank you.

Q. Now, if we exclude from consideration the acreage [fol. 4316] in west Gray County in which Panhandle Eastern possesses no acreage and we use Mr. Peterson's data as indicated on Page 28, what would be the average thickness of pay? A. Apparently, that would be 81.08.

Q. And the circumstance that causes Mr. Peterson's pay thickness to be reduced to 70 feet is simply because the balance of the gas field, to-wit, the East Panhandle

Field and the sour gas areas, are included in the total average and that brings the total down to 70 feet?

A. Apparently, from that exhibit, he has also considered the best commercial area in the East Field, in order to arrive at the 70 feet.

However, if he had considered the entire West sweet field and no part of the East Field, he might also have arrived at a figure of 70 feet average pay thickness.

. . . . . .

[fol. 4317] Trial Examiner: May I interject a question at this point? The depth of wells which you class as producing wells of the Panhandle Company is sufficiently uniform to indicate a very great uniformity of geologic formation in the area where the wells lie. Is that characteristic of this West Panhandle Field?

The Witness: Not necessarily. On the higher parts of the buried Granite Ridge, very often wells are limited to 2000 feet or less.

Mr. Culton: That is from the surface?

The Witness: From the surface. However, other wells [fol. 4318] which are on the flanks of the Granite Ridge go as deep as 3,600 feet or almost twice as deep as those which are drilled on top of the ridge. I think by reference to that cross-section map, you will understand more nearly—

Trial Examiner: (Interposing) I think I understand what you have in mind. Now, apart from your higher structures where your conditions are not typical, I assume, is the the formation rather uniform?

The Witness: On the higher parts of the Granite Ridge, the gas does not occur in the Granite Wash formation for the Granite Wash formations are accumulated along the flanks of the ridge, because the Granite Wash has originally come from the top of the ridge.

Consequently, you are limited to your Dolomitic and Limestone pay formations on top of the ridge, whereas, on the sides, you drill in the Granite Wash pay in the lower parts of the well which is very often extremely

prolific, having a much greater porosity than the Limestone and Dolomite.

Does that answer your question, sir?

Trial Examiner: In general. Apart from the wells near the higher sections, you usually have several formations that are producing, do you not, encountered in the individual wells?

The Witness: Yes, sir.

Trial Examiner: And how [may] producing strata are there as a rule, to make up your total of 70 feet?

[fol. 4319] The Witness: Sometimes as many as ten; usually 7.

Trial Examiner: Do you find a uniformity between the wells as to this fact?

The Witness: No. Very often pay sands will be encountered in one well; and in another well, one mile distant, these sands will be entirely absent.

Let me illustrate. One well may have 7 or 8 pay sands totaling maybe 80 feet of pay thickness, while, a mile away, you may have the same formations but without the porosity and, consequently, may get a section with 4 producing formations totaling maybe 50 feet.

That is what I meant when I made the statement that there were a great many variations in the field, even though the beds are similar in each of these two hypothetical wells.

The porosity did not extend from one to the other.

Trial Examiner: Thank you.

By Mr. Littman:

Q. Will you please refer to Schedule 1 of Exhibit 30.

Now, on this schedule, you have listed 34 wells for which you show the pay thickness in Column F and the initial natural open flow in Column G. Who made the determination of the pay thicknesses shown in Column F?

A. I assisted in making that tabulation with the pay thicknesses. However, the major part of the work was done by another man, Mr. Boyd.

[fol. 4320] Q. Was he your assistant?

A. He was assisting in this work, yes.

Q. And is he the same gentleman who assisted you in ascertaining the sand thicknesses of the 40-odd wells that you used for purposes of arriving at the 70 feet?

A. No, I would not say he had anything to do with the 70 feet. He did make some studies on this exhibit, and also he assisted Dr. Bartle in some of his exhibits.

Q. Who assisted you in the preparation of the work on the 40-odd well logs that you referred to in your testimony yesterday, of Panhandle Eastern?

A. Dr. Bartle assisted some.

Q. Well, in your opinion, are these pay thicknesses shown in Column F correct? A. Yes.

Q. As a matter of fact, I believe there are seven wells on this sheet that were included in the 40-odd wells upon which you relied in arriving at your 70 feet of pay thickness, is that correct? A. I believe so.

Q. Now, I call your attention to Line 3. A. Yes.

Q. Which refers to a well owned by Panhandle Eastern Pipe Line Company called the J. T. Sneed No. 1-6, which is located in Potter County.

[fol. 4321] A. Yes, sir, in Moore County.

Q. I am sorry, in Moore County.

Now, you find that that well has a pay thickness of 32 feet, do you not?

A. Yes, sir.

Q. And that was one of the wells upon which you relied in arriving at your pay thickness of 70 feet for the average of the 40 wells in the Panhandle Field owned by Panhandle Eastern? A. I believe it was.

Q. Now, I want you to refer to Exhibit 130 for identification, which is Mr. Peterson's Exhibit 219 in the Canadian River Case.

A. I noticed that when I was glancing through, there was a discrepancy between his thickness of pay and mine.

Q. Yes, I was trying to find it here.

A. Perhaps if he knew more about that well, he would agree with me.

Q. Well, of course, you think you are right, and probably Mr. Peterson thinks he is right. What pay thickness

did Mr. Peterson find on that well as disclosed in Exhibit 130 for identification? A. 75 feet.

Q. As compared with your pay thickness of what?

[fol. 4322] A. 32 feet.

Q. It is more than 100 percent off, isn't it?

A. If he had had the experience with that well that I have had, he would certainly be closer to my estimate of pay thickness.

Q. Perhaps you and he will have an opportunity to thresh that out some day but, as you have stated yesterday, it is not an uncommon thing and, as a matter of fact, it is a very common thing for geologists to disagree on pay thickness? A. And not only geologists, to disagree.

Q. Who else disagrees? A. Lawyers, I think.

Q. We disagree on everything.

Trial Examiner: Some require more "pay" than others.

By Mr. Littman:

Q. On Line 27, you show a well belonging to Cities Service Company which is called the Burnett No. 21, located in Carson County. Will you please find that well on Mr. Peterson's exhibit? A. I have it.

Q. Now, what pay thickness did Mr. Peterson put on that well? A. 127 feet.

Q. And what pay thickness did you put on that well? A. 65 feet.

[fol. 4323] I do not know what information Mr. Peterson had on the well. I only had the logs supplied me by Cities Service Company. He may have been able to examine the samples and may be more nearly right than I am.

I can only say that, apparently, the log which I had was a good one.

Q. How could you tell by looking at the samples anything about the pay thickness?

A. We went through that yesterday, Mr. Littman.

Q. You want to refer back to what you said about that yesterday? A. Yes, sir.

Q. To save time. All right. Let's get down into Mr. Culton's territory. Now, I notice in Line—

Mr. Culton: (Interposing) Just what do you mean by that?

Mr. Littman: Texoma Natural Gas Company.

Mr. Culton: Texoma is no more my territory than Panhandle Eastern or Phillips or Cities Service Company or any other client that I may have had sometime.

Mr. Littman: Don't take that too seriously, Mr. Culton.

By Mr. Littman:

Q. Line 29 on Schedule 1 shows a well owned by Texoma Natural Gas Company which is called the Burnett No. 1-S for which you show a pay thickness of 61 feet.

Now, what pay thickness did Mr. Peterson ascribe to that well, as shown by Exhibit No. 130? A. 128 feet.

[fol. 4324] Q. Well, let's look at the next line, which is Line No. 30.

A. Since that is one of Mr. Peterson's wells—pardon me.

Q. Which one is Mr. Peterson's own well?

A. This Burnett No. 1-S, I rather think he would have samples information which was considerably more than I had. I merely had a log which Mr. Peterson supplied me.

Q. Well, that is one of the difficulties that a geologist has, in determining pay thickness?

A. That is true. That is one of them.

Q. One of many of them?

A. That would be more nearly correct.

Q. Well, we will go now to Line 30, which is a well belonging to Texoma Natural Gas Company called the Burnett No. 2-T for which you have a pay thickness of 63 feet.

Will you please give us Mr. Peterson's estimate of pay thickness for that well? A. 150 feet.

Q. And Line No. 31, we have another well owned by Texoma Natural Gas Company called the Daver Well. I believe Mr. Peterson refers to that as the Bauer No. 1-G, for which you have a pay thickness of 73 feet as shown in Column F of Schedule 1 of Exhibit 30.

[fol. 4325] A. And Mr. Peterson has 144 feet.

Another reason why Mr. Peterson's figures are likely to be more accurate than mine on a good many of his wells, is that he has stayed on the well during the entire time that the well was drilling through the pay section and, consequently, should be better able to estimate the pay thickness than I would be, since I was not there.

Mr. Culton: You are referring to the Texoma wells?

The Witness: The Texoma wells: but I was not estimating the reserve under any Texoma wells, merely the Panhandle Eastern acreage.

By Mr. Littman:

Q. Now, in Line 32 of Schedule 1, you show the Crutchfield No. 1-E well owned by Texoma Natural Gas Company, for which you found a pay thickness of 85 feet.

Will you please state what pay thickness was found for that well by Mr. Peterson? A. 144 feet.

Q. Now, the wells that you have read from Mr. Peterson's exhibit appear on Page 1, do they not, of Exhibit No. 130?

A. Four of them do. Some of the others are on subsequent pages.

Q. Now, do you find the A. D. Smith No. 1-E well on [fol. 4326] your exhibit? A. I do not.

Mr. Culton: You do not describe it at A. D. Smith—

The Witness: Perhaps you mean the Smith No. 1-E, Line 33.

By Mr. Littman:

Q. Perhaps you can tell me whether that is the same well as the one which Mr. Peterson has described on Page 2 of Exhibit No. 130 which is the fourth one from the bottom of that page.

A. Apparently, they are the same well.

Q. Now, you found a pay thickness of 61 feet for that well? A. And Mr. Peterson shows 123 feet.

Q. Did you identify another well on Mr. Peterson's exhibit that you have included in your list on Schedule 1?

A. Apparently, on Page 3, the M. J. McLaughlin No. 4-M corresponds to a well on Schedule 1, Exhibit 30, Line

34, wherein Mr. Peterson shows 76 feet pay thickness, and I show 41 feet pay thickness.

Q. Now, that is the last well shown in your Schedule 1, isn't it? A. Yes, sir.

Q. We have already discussed the A. D. Smith 1-E, have we not? A. We have.

[fol. 4327] Q. Do you find the R. S. Coon, 1-M well in your Schedule 1 of Exhibit 302. A. Line 7.

Q. Now, that well is owned by the Texoma Natural Gas Company, is it not? A. Yes.

Q. Now, what pay thickness did you find?

A. 28 feet.

Q. And what pay thickness did Mr. Peterson find for that well? A. 17 feet. We are getting closer together.

Q. Yes, well, that one was not very thick. Do you find the R. S. Coon well, No. 2-M on Schedule 1 of Exhibit 30? A. In Line 6.

Q. And what is your pay thickness for that well?

A. 18 feet.

Q. What is Mr. Peterson's thickness for that well?

A. 50 feet.

Q. Now, referring to Line 4, the R. S. Coon well No. 11-M, what pay thickness did you find for that well?

A. 32 feet.

Q. What pay thickness did Mr. Peterson find?

A. 55 feet.

Q. You have a well called the J. W. Moore, et al, 1-P? [fol. 4328] A. Yes, at Line 19.

Q. And that is Line 19 of Schedule 1 of Exhibit 30?

A. Correct.

Q. And what pay thickness do you have for that well?

A. 74 feet.

Q. And what pay thickness did Mr. Peterson find?

A. 175 feet.

Q. Do you find the T. Thompson well No. 1-P in your schedule 1? A. At Line 20.

Q. And what is your pay thickness? A. 58 feet.

Q. What is Mr. Peterson's pay thickness?

A. 123 feet.

Q. Do you find the J. T. Sneed No. 13-E well in your Schedule 1 of Exhibit 30? A. At Line 16.

Q. What is your pay thickness? A. 46 feet.

Q. And what is Mr. Peterson's pay thickness?

A. 66 feet.

Q. Do you find the J. T. Sneed well No. 10-P in your Schedule 1? A. Line 18.

Q. And what is your pay thickness as shown in that schedule? A. 40 feet.

[fol. 4329] Q. What is Mr. Peterson's pay thickness?

A. 95 feet. The same applies to all of those Texoma wells, where undoubtedly Mr. Peterson had more information than I did and possibly his figures are much more accurate.

However, these pay thicknesses were not used in arriving at my average, and I was not considering reserves under Texoma acreage, only that under Panhandle Eastern acreage.

Q. Well, one of these wells was used that we have been talking about the past few minutes?

A. That is true.

Q. Namely, the J. T. Sneed No. 1-6 appearing in Line 3, is that correct? A. That is true.

Q. For which you found a pay thickness of 32 feet and Mr. Peterson found a pay thickness of 75 feet?

A. That is true, but I do not think Mr. Peterson knows as much about that well as I do.

Q. Well, and we, of course, do not have your list of 40 wells but perhaps you can tell us whether or not Mr. Peterson has included a good many of your 40-odd wells in his list of 130. We do not know, frankly.

A. I do not, either.

[fol. 4330] Q. Well, when we secure your list and your pay thicknesses, then, of course, the differences, if any, will appear, is that correct? A. That is true.

Q. But this does illustrate, does it not, Mr. Smith, the wide variations in findings of pay thicknesses as between competent geologists, is that correct?

A. I would say so.

Q. In other words, what we have been talking about is not an unusual thing. It is the usual thing, is it not, this wide discrepancy and variance in ascertaining pay thickness?

A. It is common, yes, for everyone to have differences of opinion.

Q. Now, under the porosity method, an accurate determination of pay thickness is, of course, essential to an accurate estimate of gas reserves, is it not?

A. That is true, to be able to tell definitely how much gas is there. However, in estimates, the word "estimate" of course is self-explanatory, that it is not accurate but only someone's idea as to what probably is or was or might be.

Q. Well, of course, one of the difficulties of the porosity method and its application is the difficulty of ascertaining the precise pay thicknesses throughout the area involved, is that not correct?

A. That is true, and I think that all other methods [fol. 4331] used in estimating reserves also have their difficulties and inaccuracies, as well as this one.

I would not have selected this one had I not thought I could obtain the most accurate estimate of the reserves under Panhandle Eastern's acreage.

Q. But there are other methods of ascertaining reserves which are not beset with the difficulty which we have been talking about for the last hour, namely, the difficulty of ascertaining the accurate pay thicknesses?

Mr. Culton: You mean reserves under a particular tract of land?

Mr. Littman: Yes.

The Witness: Not that difficulty, but some other difficulties which I consider much greater.

By Mr. Littman:

Q. All of which indicates, of course, there are still further differences of opinions among geologists?

A. Yea, verily.

Q. Now, one of the methods that does not require the ascertainment of pay thickness is the rock pressure decline method, is that correct? A. That is true.

Q. When the rock pressure decline method is used, you do not have to determine any such thing as porosity either, do you?

[fol. 4332] A. Only equalized pressure presen., which is a bigger problem than I would want to tackle in the time that I made this study.

Q. You have already indicated that you have some quarrel with the rock pressure decline method, but I did want to make it clear upon this record that the rock pressure decline method does not comprehend any application whatever of any calculation of (1) pay thickness or (2) porosity. Is that correct?

A. That is true. I do not throw the rock pressure decline method out entirely. In some fields, I think that is the best method to use, but not in the Texas Panhandle Field.

Q. Dr. Bartle used it, didn't he? A. That is true.

Q. In other words, you are not attacking the rock pressure decline method as a general method?

A. That is right.

Q. But you are saying that it is not a good method to use in the Panhandle Field of Texas?

A. That is absolutely correct.

Q. Now, I believe you stated yesterday that you used a so-called 90 percent recovery factor which, in effect, results in a 10 percent lower estimate of gas reserves than you would have otherwise found, is that right?

A. That is true.

[fol. 4333] Q. Now, one of the reasons which you give in your testimony for using a 90 percent recovery factor is, "the varying differences in depth of pay under varying differences in porosity and permeability." Is that correct? A. I do not believe I said "depth of pay."

Q. I stated this was one of the reasons that you gave. Will you turn to Page 19 of Exhibit 30 and I think we will soon be able to tell whether I copied the testimony correctly or incorrectly in my notes.

A. You are right, I did say "depth of pay."

Q. That appears in the 9th and 10th lines from the bottom of Page 19 of Exhibit 30, does it not?

A. Yes, I have it.

Q. Now, how do those factors affect the ultimate recovery, Mr. Smith?

A. Well, one way of explaining that would be to take the two hypothetical wells which I was talking to the Trial Examiner about earlier, wherein I explained that the various pay formations were not continuous throughout the field, and I think it is safe to deduct from that

that there may be pay formations between wells which never will be tapped.

The fact that porosity and permeability are not continuous would not permit all the gas to be withdrawn. The depth of pay, I do not remember just exactly what I did have reference to there, unless it might be that the deeper pays would be more vulnerable to the encroaching [fol. 4334] water and the water would consequently keep some of the gas from being recovered.

The fact that the wells are drilled on an irregular pattern would tend to create differences of pressure between wells and would have an effect of keeping some of the gas from reaching a well bore.

Q. You mentioned those factors a little further down on the page. I was inquiring particularly with respect to "the varying differences in depth of pay and the varying differences in porosity and permeability", as distinguished from the other factors which you named, and I was trying to ascertain how those factors which I just quoted from your testimony could possibly affect the ultimate recovery.

A. I believe I have answered that question.

Q. Well, as to the varying differences in depth of pay, you used a 70-foot average, did you not?

A. That is true. That is thickness of pay, however, not depth of pay.

Q. What is the distinction, as you use it?

A. The thickness of pay is made up of the aggregate thickness at which gas is found in the production section. I mean by that, there may be one pay thickness of 5 feet, another of 20 feet, and all those added together would make the average of 70 feet thickness of pay.

[fol. 4335] The depth of pay would be the depth beneath the surface of the ground, which might be 2,000 feet, might be 1,500 feet, or might be 3,500 feet.

Q. How would that affect the recovery?

A. As I said, the deeper pays would be closer to the water encroachment. As it got down near sea level, there would be more likelihood of some of the gas being prevented from reaching the well bore by water encroachment.

Q. And your contours show that Panhandle Eastern's acreage is located near the top of the structure, is that not correct?

A. I mentioned also the fact at the same time I made that statement, that water had been noticed to be coming from the northeast part of the field and was fingering in, so to speak, toward the Panhandle Eastern acreage.

Trial Examiner: The record shows the use of acid as one of the artificial means, so to speak, of increasing the production of a properly drilled well.

Are there others?

The Witness: Not in use at the present time. Shooting has been used but is not used currently.

Trial Examiner: That is what I had in mind. I did not know.

[fol. 4336] Mr. Culton: Will you tell the Examiner why? What happened to the shooting?

The Witness: Shooting has been found to increase the difficulties with which gas is produced. It fractures the formation at the point where the shot is discharged and permits particles of shale and lime and granite wash to be produced with the gas and greatly increases the producing problems, for one reason.

Another reason, very often a cavy formation or cavy condition results from shooting the wells, and that has to be combatted during the entire life of the well.

Trial Examiner: That would be particularly damaging because of the fact that you used so much open hole?

The Witness: Yes, sir.

Trial Examiner: There is no way of knowing, of course, when you use acid just how effective that acid is going to be? In other words, in some wells you encounter a much larger predominance of limestone formation than you would in others, and I assume that a good deal of the acid treatment is more less wasted?

The Witness: You can determine prior to acidization, to a certain extent, what the effect of the acid will be, by examination of what samples you have.

Trial Examiner: Your cuttings?

The Witness: And testing the solubility in acid of those [fol. 4337] cuttings.

Trial Examiner: Is the acid treatment all applied after the completion of the well, or is it applied in steps as the drilling proceeds?

The Witness: Some companies use an acid treatment immediately before drilling in the granite wash, which is probably a very good method. That is, they drill down to approximately the top of the Granite Wash pay zone and acidize the well, then drill into the Granite Wash after the well has been acidized.

The step method which you are probably referring to is the one wherein we use, say, 1,000 gallons of acid first, then later another step would be a 2,000-gallon treatment, and [possible] a third would be a 6 or 7,000-gallon acid treatment, wherein we progressively reach back away from the well bore to increase the size of the bore and thus permit a greater number of pores or greater permeability to be in contact with the well bore.

Trial Examiner: Of course, there is no way of determining the effective zone of the acid reaction?

The Witness: No, sir, that can only be estimated.

Trial Examiner: Either it works or it does not work, and your measure of success is in the production increase?

The Witness: Yes, sir. I do not believe the acid will cause wells to produce any more, but it will probably cause [fol. 4338] them to produce faster.

It may, of course, if it reaches into, and eats out a nonporous zone or nonpermeable zone and permits a permeable zone to be in contact with the well bore by increasing the diameter of the well bore, the production would be increased.

Trial Examiner: A faster and greater production would be synonymous in case there was an offset well nearby?

The Witness. That is true.

. . . . . .

By Mr. Littman:

Q. Well, Mr. Smith, we were discussing the 90 percent recovery factor and you had explained how, in your opinion, the depth of pay would affect the amount of recovery.

Now, as to porosity and permeability, how would those factors affect the recovery, bearing in mind that you use an average porosity of 20 percent, to be conservative?

A. That average porosity of 20 percent does not mean that it is uniformly 20 percent throughout the field, by any manner of means.

That average porosity of 20 percent may vary, the two extremes from 5 percent up to 100 percent.

Q. You mean it varies up and down? A. Yes, sir.

[fol. 4339] Q. But the average is 20 percent, isn't it?

A. Yes, sir.

Q. According to your—

A. (Interposing) That is the figure I used.

Q. Why did you assume here—withdraw that—why do you then knock off another 10 percent of your entire estimate which was arrived at by the average?

A. On the face of it, since it varies that much in the well bores, it stands to reason that it will also vary outside the well bores similarly, and if it does vary similarly away from the well bores, then there will be places away from the well bores which will have so little porosity and permeability that the gas contained there away from the well bore will never reach the well bore.

Q. I understood when you used a figure of 20 percent porosity, that that 20 percent took into account the variations up and down.

A. It does.

Q. Why do you always assume conditions below rather than above the average?

A. You mean, that it would be just as safe for me to assume that all these pay formations were connected or continuous throughout the field.

I think the evidence points the other direction, since in one well, you get 10 pay formations, and in another well, [fol. 4340] you get 5 or 3.

Q. But the average of those formations with respect to porosity is, according to your testimony, a conservative 20 percent, is it not?

A. Yes.

Q. Why knock off something from that merely because, in some instances, porosity is greater and in some instances it is less than 20 percent.

I simply cannot understand why, and I am asking you to explain why.

A. Because that porosity is not continuous and the permeability is not continuous.

Q. But the 20 percent is the average, is it?

A. 20 percent is the average which I assumed, yes.

Q. Isn't it a fact you took off 10 percent for the purpose of being conservative, to use your language of yesterday?

A. No, sir, not necessarily.

Q. It was one of the reasons, is it?

A. That is one of the reasons, and the other is that I cited, with the encroachment of the water, which would prevent all of the gas from being recovered which is evidenced by the fact that there is great variation in the exhibit which has been offered, compiled by Mr. Peterson.

The fact of the great variation in thickness of pays [fol. 4341] which range there, I believe, from 18 feet up to 175 feet, would indicate the great variations throughout the field. It would certainly stand that they are not continuous if, in one well, you have 18 feet and, in another well, you have 175 or almost 10 times as much.

Q. Well, I understood that your average of pay thickness took into the account the ups and downs, and that the average was struck having those ups and downs in mind.

Now, is my understanding correct?

A. No, but this is a different matter. This is an entirely different matter from an estimation of the amount of gas under the various pieces of acreage.

Q. Now, you have offered some sand thickness graphs which have been designated as Exhibits 28 and 29.

A. Yes, sir, and with those graphs, I intended to show graphically the great variations throughout the field.

Q. In what?

A. Porosity, permeability, thickness of pay, potential of the wells.

Q. All of which indicates the difficulties encountered in determining the porosity and sand thickness?

A. Correct.

Q. To what use did you put these graphs, in computing the estimate of gas reserves of Panhandle Eastern that appear in Exhibit 30?

[fol. 4342] A. To substantiate the 10 percent recovery factor.

Q. For any other purpose, other than to show the variations——.

A. (Interposing) Throughout the field.

Q. That is described?

A. To show the general character of the field.

Q. Have you ever made an estimate of the amount of gas which Panhandle Eastern could expect to produce from its wells in 1940?

A. No, not in any one year.

Q. But you have made an estimate with respect to productivity? A. As shown in Exhibit 30.

Q. Well, that is in toto, is it not? A. Yes.

Q. But you have not made any estimate of the amount of gas which Panhandle Eastern could expect to produce from its wells for any given year, have you?

A. No, sir.

Q. Who selected these 34 wells which are reflected in your sand graphs?

A. Mr. Boyd, Dr. Bartle and myself.

Q. Why were these particular wells selected?

A. They most nearly indicated the point which we wanted to bring out.

[fol. 4343] Q. That is, the point of the variations?

A. Yes, sir.

Q. In pay thickness and porosity and permeability?

A. Yes.

Q. Why didn't you use 34 of Panhandle Eastern's own wells for this purpose?

A. No particular reason.

Q. Are these wells representative of the situation that prevails in Panhandle Eastern's acreage?

A. Probably so.

Q. How many of these wells that you show in sand graphs, Exhibits 28 and 29, are Panhandle Eastern's wells?

A. Six of them are owned by Panhandle Eastern Pipe Line Company, and one other is connected to Panhandle Eastern Pipe Line Company.

Q. That makes 7 out of the 34? A. Yes.

Q. Please refer to Schedule 5 of Exhibit 30.

A. Yes, sir.

Q. Do the columns headed, "Open flow potential—M.c.f." refer to initial open flow or to the open flow as of each of the years 1935 to 1940?

A. The open flow of each of the years.

Q. You do, however, show the initial flow down at the bottom of the page, do you not? A. Yes, sir.

[fol. 4344] Q. Did you use the data on this schedule to compute your estimate of remaining gas?

A. This schedule was made up principally to show that the wells connected to Panhandle Eastern Pipe Line Company are above the average of the remainder of the field in open flow capacity.

Q. For example, for the year 1940, this schedule shows that Panhandle Eastern's wells have a 50 percent larger open flow potential than the average wells in the Panhandle Field, is that correct?

A. That is correct, approximately 50 percent.

Q. Have you at any time made an estimate of remaining gas content of Panhandle Eastern's acreage based upon the existing rock pressures rather than upon the original rock pressures?

A. I have studied that and attempted to make an estimate of that, from time to time.

Q. You never concluded your studies in that regard?

A. That is true.

Q. Can you state what initial quantity of gas you found per acre upon the method that you utilized, the present rock pressure rather than the estimated—

A. No, I cannot.

Q. You do not recall any figures you can give us at [fol. 4345] this time with respect to the estimate that you made?

A. No, I cannot.

Q. Now, just one or two more questions, and these relate to the rock pressure maps for the years 1938, 1939, 1940 and 1941 which have been designated for identification as Exhibits 24, 25, 26 and 27.

Is my understanding correct, that you prepared that part of these maps with respect to the Hugoton Field as well as that for the Panhandle Field?

A. I worked with Dr. Bartle on that part of the map.

Q. Was it a joint enterprise or—

A. (Interposing) I would say yes, it was a joint enterprise.

Q. Now, what isobaric intervals are shown on those maps? A. Ten-pound intervals.

Q. For the Hugoton Field?

A. For the Hugoton Field.

Q. And from what source was the information obtained for the purpose of establishing the rock pressure bands for the Hugoton Field?

A. From well tests that are taken annually on those wells.

Q. On which wells?

A. The wells in the Hugoton Field, all wells in the [fol. 4346] Hugoton Field.

Q. That is, this rock pressure map was constructed from data derived from not only Panhandle Eastern's own wells but from the wells of others in the field?

A. All other wells in the field.

Q. Why didn't you use 50-pound isobars in the case of the Hugoton Field as you did in the case of the Panhandle Field?

A. Because 50-pound isobars would not have shown as clearly the existing conditions in the Hugoton Field as the 10-pound isobars do, and if 10-pound isobars had been used in the Texas field, in order to make the two comparable, it would have been a maze of lines and probably not comprehensible.

Q. You mean, the map would be too small to be utilized for purposes of showing 10-pound isobaric intervals?

A. The scale of the map would have been too small, yes.

Q. Well, there isn't any doubt in your mind, is there, that that part of the map which shows the 10-pound isobaric intervals is much more accurate than the part of

the map which shows the Panhandle Field by 50-pound intervals?

A. That is true. Another reason why we used the 50-pound was because those maps were already available as published by the Texas Railroad Commission, and we did not have sufficient time to work up a 10-pound isobar [fol.4347] map on the Texas Field from any records that we had or could obtain.

Q. I take it you consider it would have been desirable to do so? A. Certainly.

Q. Now, you stated that in making the map for the Hugoton Field for the years 1938 to 1941, as shown in Exhibits for identification 24 to 27, inclusive, and respectively, you utilized the rock pressure readings from all of the wells?

A. That is true.

Q. Will you please state the source of the information?

A. I believe in all cases the reports as published by the Kansas Corporation Commission were used.

Q. Now, Dr. Bartle made direct use of the Hugoton Field rock pressure maps 24 to 27, inclusive? A. Yes.

Q. In arriving at his estimate of reserves?

A. That influenced it. I believe, after a study was made of those maps and figures obtained from data on the maps, and the Kansas Corporation Commission Reports, that also another method was used in arriving at the per-acre reserve of the Hugoton Field, namely, the thickness of pay, porosity method.

Q. Well, the fact is, however, that as to the lower part of these maps, which shows the Panhandle Field and the [fol. 4348] 50-pound isobaric intervals for rock pressures for the various years, you did not use those, strictly speaking, in calculating your reserves, did you?

A. No.

Q. Mr. Smith, you have also made an estimate of—withdraw that—in Schedule 7 of your Exhibit 30, you show the Hugoton production to Argus Natural Gas Company by Panhandle Eastern Pipe Line Company, do you not?

A. Yes, sir.

Q. You, however, did not make an estimate of the reserves that are subject to the Argus Natural Gas Company contracts, did you?

A. No, neither Dr. Bartle or myself.
Q. Those were excluded from consideration?
A. Yes, sir.

. . . . . .

GLENN G. BARTLE, a witness, having been previously sworn, resumed the stand and testified further as follows:

Cross-Examination.

By Mr. Littman:

Q. Dr. Bartle, you prepared Exhibit No. 36, did you not? A. Yes, sir.

Q. Will you please turn to Page 2? A. All right.

Q. Of your written testimony. I note there are two page 2's. A. Yes.

Q. I am referring to the second one.

A. Yes, sir.

Q. On that page, you made the following statement:

"I have indicated the probable boundaries on all sides of the rock pressure and open flow maps hereafter discussed by a broken line."

Which maps do you refer to by that statement, Dr. Bartle?

[fol. 4353] A. The rock pressure maps are the ones that were introduced in evidence by Mr. Smith because he was referring to the south part of it.

Now, that same map reaches on up into the north part of the Hugoton area. Those are the exhibits beginning with No. 24, the ones we have been referring to.

Q. I believe they are Exhibits 24, 25, 26 and 27 for identification? A. That is right.

Q. Being rock pressure maps for the years 1938 to 1941?

Mr. Culton: And also 1932; wasn't there?

Mr. Littman: 1938, 1939, 1940 and 1941.

The Witness: The 1932 map would be Exhibit No. 23. The 1938 map is No. 24. Anyone of those maps shows the boundary line as we now think it to be, not as we thought it to be at any specific date in the past.

By Mr. Littman:

Q. In other words, the line to which you refer in the testimony which I have read is the line which represents your present judgment?

A. That is right.

Q. Suppose we look at the latest of those maps?

A. All right, the 1941 rock pressure map.

Q. That would be Exhibit 27.

[fol. 4354] A. You notice that this is a dotted line. We do not attempt to say the exact ultimate limits of this field, and we are not making an estimate of the whole field for that reason.

I will be glad to go around the field with you, showing you the dry holes and the wells near the edge, if you care to have me do so, indicating the basis for this dotted line as of the present time.

Q. Before you do that, Dr. Bartle, it may be well for you to do just that later, but we have not stated, as yet, in the record, that we are now discussing the Hugoton Field.

We want the record to show that, do we not?

A. Yes, sir.

Q. If I correctly understand your testimony, this dotted line is your best judgment as to the present boundary of the Hugoton Field, is that right?

Mr. Culton: You mean present judgment as to the boundary?

The Witness: Yes.

By Mr. Littman:

Q. Present judgment as to the boundary?

A. That is right.

Q. Would it be the present boundary, in so far as it is shown on your 1941 map, would it not?

[fol. 4355] A. That is right. We did not think there was any reason for going back into our 1932 conception or our 1938 conception, since that was only of historic interest.

Q. When you used the term "probable boundaries on all sides", in your testimony on Page 2, you are referring to that dotted line shown in this map which is Exhibit 27?

A. That is right.

Q. Now, on Page 2, you make the following statement, "the total area within the broken line is approximately 2,540,000 acres," is that correct?

A. That is correct, that is a statement of information.

Q. Have you ever made an estimate of the total original recoverable reserves for this area?

A. For this whole area?

Q. Yes, for the area embraced by this dotted line and which you state embraces 2,540,000 acres.

A. No, I have not. I have not classified this acreage separately into various classifications. It is possible that further development will bring about such a classification.

So far as the Panhandle Eastern's acreage which I evaluated in this exhibit—

Q. (Interposing) Exhibit 36?

A. Exhibit 36, I assumed that the acreage which they have located was of the same order, that is, we did not give more than one estimate. We used this estimate of 9,500,000 at the sand face.

[fol. 4356] Q. 9,500,000 cubic feet?

A. Cubic feet per acre at the sand face as applying to all of the Panhandle Eastern acreage.

Q. Pardon me, may I interrupt right there?

The 9,500,000 cubic feet figure to which you have just referred is your estimate of the original amount of gas?

A. Of the original amount of gas at the sand face. That is not the amount recoverable.

Q. Pardon the interruption, I thought it would be better to clear that up as we went along.

A. Yes.

Now, as to the amount of production which could be expected at the edges of this field, I do not believe it is yet possible to make a classification of acreage that would be at all accurate but, for the Panhandle Eastern acreage scattered to some extent across this field, we are still using the same figure.

Q. Namely, the 9,500,000 cubic foot?

A. The 9,500,000 cubic feet.

Q. To be exact, that figure is 9,541,000 cubic feet; is it not? A. That is right.

The wells at the edge of the field, in many cases, have had a smaller open flow. As to how many of the spots [fol. 4357] scattered away from this withdrawn area will turn out to be good, that would still be impossible to tell.

Undoubtedly, there will be some good spots and some poor spots scattered over the field as a whole.

Q. What, in your judgment, would be the proper original gas content per acre figure to use for the entire area in the Hugoton Field of 2,540,000 acres embraced by the dotted line?

A. I have no basis for any other figure than the one of 9,500,000 which I believe to be the true figure for the withdrawn area.

As I have tried to say, I think that in the other regions which are not now withdrawn and in which we have less information, there will undoubtedly be some good spots and some poor spots.

I have no basis, though, for any other estimate than that.

Q. When you used the term "withdrawn area", will you indicate on the map, Exhibit No. 27, what you refer to?

A. The area chiefly which is colored some other color than the light yellow, buff. That is the area which has suffered a decline of pressure to 430 or below.

That makes up on the latest map here a total of about half a million acres—I will give it to you exactly—467,640 acres which is less than one-fifth of the total area within [fol. 4358] the dotted line.

Q. So that there is a considerable area within the dotted line boundary of the Hugoton Field for which you state you cannot now make an estimate of original gas content?

A. Except on the assumption that the behavior of that will be comparable to this withdrawn area.

Q. And what is your best judgment with respect to that? Is it your best judgment at this time that the areas outside of your areas of withdrawal will yield approximately the same original gas content as that which you have assigned to the areas within your areas of withdrawal?

A. As I said to you, I have no basis for any other estimate than the 9,500,000. I think that there will be good spots develop, as good as this, and perhaps even better.

I feel quite sure that there will be large areas of this 2,500,000 which will be less.

Q. But on the average, what would you say?

A. On the average, I would think it would be about the same.

Q. That is the same, namely—

A. (Interposing) 9,500,000 per acre.

Q. 9,500,000 cubic feet per acre?

A. At the sand face.

Q. At the sand face? A. Yes.

[fol. 4359] Q. And the area that we have been talking about, as you have just stated, which is outside of the areas of withdrawal and yet within the total boundary—

A. (Interposing) Within the dotted line—

Q. (Continuing) —represent approximately four-fifths of the entire area within the boundary?

A. That is right.

Q. Now, does all of Panhandle Eastern's acreage, and by that I mean acreage not only owned by Panhandle Eastern but subject to its gas purchase contracts fall within these so-called areas of withdrawals which you have described?

A. I believe not. The operated acreage does, but the unoperated acreage, of course, does not.

Q. Would you mind giving us one or two examples of that situation?

A. It will be necessary to refer to the exhibit that Mr. Smith introduced in evidence of Panhandle Eastern acreage holdings, the number of which I do not remember.

Q. I will be very glad to hand you my copy of Exhibit 30, Dr. Bartle.

(Whereupon, a document was handed the witness.)

The Witness: The map that he introduced—

Mr. Culton: (Interposing) The ownership map.

The Witness: The ownership map.

Mr. Littman: Do you know the exhibit number of that, Mr. Culton?

[fol. 4360] The Witness: A comparison of that map and any one of these pressure maps would give the information I desire.

Mr. Culton: No. 20.

Mr. Littman: Exhibit No. 20.

The Witness: You want me to give some acreage that Panhandle Eastern owns which is not within the withdrawn area?

By Mr. Littman:

Q. Yes, generally, Dr. Bartle, don't spend much time on it.

A. All right. For instance, this area in western Seward County, northwest of Liberal in Township 32-34 and 33-34.

Q. That is a considerable amount of acreage.

A. That is a considerable block of acreage which is not in an area which has been withdrawn, at least, not enough to give us any accurate data as to the value of that acreage.

However, in my estimate, I considered that to be of the value of 9,500,000 at the said face even though I had little data to support that estimate.

Q. And I see some other acreage outside of the areas of withdrawals.

A. The area in Texas County, Oklahoma, both north and south of the village of Optima in Oklahoma, Townships 4-16 and 3-16, that makes a block of acreage which is [fol. 4361] not drilled and from which there has been no gas withdrawn.

Q. And that is a considerable block of acreage also, is it not?

A. That is a considerable block, yes.

Q. Without going into any further detail at this time, there are some other considerable blocks of acreage that fall outside of the areas of withdrawal?

A. That is right. Probably the place which I am farthest out on the limb is Hansford County, Texas, in which we own acreage and which is far from production.

Q. That sticks out kind of like a sore thumb at the bottom of the map. That is away from your areas of withdrawal, is that right?

A. That is right.

Q. I hope you will pardon my homely analogy.

A. We will all have a lot of homely analogies, perhaps.

Q. And, notwithstanding the fact that those acres are outside of your areas of withdrawals, you did, nonetheless, accord to them the original recovery of 9,500,000 cubic feet?

A. No, the full original amount of gas at the sand face.

Q. I am sorry. A. Of 9,500,000.

[fol. 4362] Q. Of original gas content?

A. Yes, and the reason I did that was because I had no other information which would apply more specifically.

Q. Now, Dr. Bartle, you suggested a moment ago that you were going to tell us how and why you drew the dotted boundary line. You are perfectly at liberty to go right ahead and tell us about it.

Mr. Culton: I wonder if you could explain that better if it were on the board?

The Witness: Perhaps.

By Mr. Littman:

Q. Pardon me, Dr. Bartle, before you proceed with your explanation, is my understanding correct that when you used the term "at the sand face", that that term is synonymous with "original gas content"?

A. Original gas content, yes.

Q. But at the pressure which would be expected to be found at the sand face? A. That is right.

Q. What pressure would that be, approximately?

A. Absolute. That is an absolute pressure, I believe, of 476. I have it in my figures, if you want it.

. . . . . .

[fol. 4365] GLENN G. BARTLE, a witness, having been previously sworn, resumed the stand and testified further as follows:

Cross-Examination (Continued):

By Mr. Littman:

Q. Dr. Bartle, at the close of the morning session, you were about to explain the method used in drawing the dashed line indicating the general boundary of the Hugoton Field on Exhibit No. 27.

A. Yes.

Q. Would you proceed now with your explanation?

A. I might call attention to the fact that this Hugoton Field, as we are using the term, is not the original Hugoton Field around Hugoton but the extension of the same into this very considerable area, everything outside of the Texas Panhandle Field which Mr. Smith has discussed.

This is a very considerable area then, reaching from a [fol. 4366] point west of Garden City and east of Lakin, Kansas, to southern Sherman and Hansford counties, Texas.

The information we have on the edge wells or on the wells near the boundary would be important, then, in knowing how large the whole field is. That does not mean that there could not be dry holes drilled within the area which we have dashed and colored.

All that means is that there have been no wells that were absolutely dry drilled as yet.

Some of these edge wells are as follows:

In Texas County, Oklahoma, the Three Way Oil Company drilled a well known as Johnson No. 1 in Section 11-1-18. That well is near Hardesty. At this point, the well—

Mr. Culton: (Interposing) Is that marked with a circle?

The Witness: Marked with a circle on the exhibit.

The well showed a small amount of gas estimated at 2 million at 2,560 and 2,620. It was drilled to a total depth of 4,600 feet, but it seemed to be so small that we have dropped that outside of the boundary of the field.

Another well in the same general region was Allison & Sturdevant No. 1, Gailey, Section 30-2-18, immediately east of the village of Hardesty. The open flow of that well, natural, was only 300,000 cubic feet per day at a depth of 2,698 to 2,750. After a shot, however, that showed about 2 million open flow and I have put that inside of the produc- [fol. 4367] tive area.

In the same region, the Underwood-Jollife No. 1 Well, in Section 28-3-19, indicated on the map, was reported

entirely dry at the depth of 2,717 and I put that outside the boundary of the field.

Trial Examiner: By the way, Dr. Bartle, the field boundary which you have sketched on this map is your own conception of the boundary of profitable production?

The Witness: That is right.

There might be a question about profitability in many of these cases, but, there is a considerable amount of gas, enough to justify being included in the Hugoton Field is my conception.

Near Texhoma in the same county, the Home Development Company drilled Allison No. 11 in Section 4-1-12.

Mr, Culton: That is on the west side?

The Witness: That is on the west side of the field, a point immediately north of the village of Texhoma.

This well was reported to have 10 million cubic feet per day at a depth between 2,670 and 2,850. It continued drilling to a total depth of 3,040.

Another well in the same section, the Washoma Petroleum, Allison No. 1, had gas estimated to be between 5 and 10 million feet per day at 2,710 and was drilled to a total depth of 4,071.

[fol. 4368] However, these wells were never connected and the report was incomplete. There are no samples available, nothing that would indicate the accuracy of that report.

Furthermore, we have observed a tendency for the well drillers, particularly in a remote area, men who are used to getting large wells in the Texas Panhandle Field, to roughly estimate a larger amount of gas than later indications would justify.

It is possible that this should be included within the boundary of the field. I did not think so. If we did include that, that would extend the boundary a little bit farther west in Texas County, Oklahoma.

In the vicinity of Hooker in the same county, the Peerless Oil Company drilled Elmore No. 1 in Section 28-5-18,

about four miles east of Hooker. The original open flow was 2,500,000.

After acidizing, it showed 12,464,000 with a good gas record at 2,646 and between 2,701 and 2,738. I have, therefore, put it inside the boundary of the field.

In the same area, the World Petroleum, Deardorf No. 1, Section 2-4-19, indicated on the map, was completely dry, although it drilled to a depth of 3,432, seeming to be outside of the Hugoton Field. I have, therefore, drawn the line between this small producing well and this dry hole.

Near Goodwell in the same county, Hagy-Harrington & [fol. 4369] Marsh drilled Becker No. 1 in Section 4-1-13 reported about 8 million cubic feet of gas, and I have included that in the field.

Only two miles west, Hagy-Harrington & Marsh drilled Peek No. 1 in Section 6-1-13, which reported 2,750,000 feet of gas between 2,834 and 2,885. That is the only information I have that seems to apply in Texas County, Oklahoma, except of some interest, perhaps, a recently drilled dry hole in Beaver County, T. K. Loffland, No. 1 Fee in Section 13-6-21 at the extreme edge of my map.

Mr. Culton: Extreme right edge?

The Witness: Extreme right edge of my map, a point about 15 miles southeast of Liberal, Kansas. This well was completed about the middle of September for a dry hole.

In Texas, the situation is much the same. In Hansford County, the Texas Mineral Investments, Norton No. 1, drilled in Section 123 of Block 2, G. H. & H. was a dry hole or a well with only ½ million, 500,000 cubic feet of gas from 3,005 to 3,055. Such a small showing did not seem to justify inclusion in the Hugoton Field.

In the same county, Curley Hobbs, No. 1 Pearson-Hitch, Section 290, Block 2, G. H. & H., indicated on the map, reported gas at 2,680 to 2,685 and again at 2,730 to 2,825, a total of 5,100,000 cubic feet open flow. It is not clear from that log whether that was after shooting or before, but, in any event, I have included that within the Hugoton Field [fol. 4370] on the basis of that 5 million well.

The Caldwell No. 1 Adriance, in Section 21, Block 3, G. H. & H., in the extreme southern part of Hansford County, reported only a gas show at 2,952 and at 3,070. Therefore, it has been left outside of the Hugoton Field in a region presumed to be dry even though it is immediately north of a portion of the Texas Panhandle Field, making an indention or embayment of the dotted line farther west than might be logically expected.

The Oklavania No. 1 Coots, Section 13, Block 45, H. & T. C., is a dry hole drilled to 4,585 in the same county. That is immediately east of the production that we have been discussing.

The Oklavania No. 1 Whitson in Section 2, Block 4T, T. & N. O., southeast of the former dry hole, was also dry at 3,510.

The I. T. I. O. No. 1 O'Laughlin, Section 2, Block 2, W. C. R.R., northeast of the former dry hole, was dry at 3,249.

It will be noticed that these depths are sufficient to penetrate the formations which would be expected to bear gas if there is a comparison between the Hugoton Field at Hugoton or the Texas Panhandle Field toward the south.

In Sherman County, Texas, the Phillips Petroleum, L. M. Price No. 1, drilled in Section 33, Block B-2, G. H. & H., indicated on the map, showed only 1,000,000 of gas at 2,105 [fol. 4371] and 1,500,000 of gas at 3,140. Although drilled to a total depth of 4,004, a very small well, yet it seems to belong inside the gas production area on the basis of that showing.

Hagy, Harrington & Marsh, Freeman No. 1, in Section 46, Block 2, G. H. & H., that is in the northeastern Sherman County near the Hansford County line, showed 15,445,000 cubic feet of gas open flow at 2,776 to 2,933. Not on a detailed log, obviously.

Possibly this well was acidized in order to obtain that much open flow, although the log record is not clear on that point; but I have included that within the area of the gas field.

Gibson Oil Company, Bivins No. 1; in Section 35, Block B-3, G. H. & H., indicated on the map, showed gas at 2,980, and 3,030, at 3,050, estimated to between 10 and 15 million cubic feet; was drilled to a total depth of 3,660 and is included in the area inside of the gas field.

Marland No. 1 Flores in Section 64, Block 3-T, T. & N. O., in the extreme southern part of Sherman County, had a small showing of gas, amount not estimated by the drillers, at 3,045. It was drilled to a total depth of 4,003 and I have drawn the line near that well but have left that immediate area outside of production.

I. T. I. O., Bryant, in Section 369, Block 1-T, T. & N. O., indicated on the map, is the farthest west well, was re- [fol. 4372] ported to have 33 million cubic feet of gas at 2,600 to 2,900; again not a detailed log, a little difficult to tell a great deal about it; but, with that large report of gas, not only at 2,600 to 2,900, but at 2,900 to 3,050 and an oil showing at 3,980, led me to put that inside of the gas field, which might conceivably be a separate gas field, as far as I can tell.

That well went to a total depth of 5,138 where it encountered granite and was probably acidized to get this large amount of gas.

I. T. I. O., Davis, in Section 404 in the same area, Block 1-T, T. & N. O., showed 34,900,000 at 2,700 to 3,282, drilled to a total depth of 3,850 and is inside the gas field.

Phillips Petroleum, O. I. Jones No. 1, in Section 161, Block 1-C, G. H. & H., in Sherman County, indicated on the map, northeast of Stratford, showed gas apparently in very small amount at 2,925 but was completed as a dry hole at 3,850 and is, therefore, outside of the boundary line.

Coming on up into Kansas in Morton County, Kansas, Watson No. 1 in Section 27-34-40, near Rolla, south of Rolla, also inside the field, with a total gas showing of 5,917,000 picked up in many places in the hole at 2,508, 2,560, 2,585, 2,670.

Although there is no production log on it, I included that in the gas field and that is a well that has been drawn from.

[fol. 4373] Burton No. 1 in Section 11-33-40, indicated on the map, is also a producing well although it only showed 1,572,000 and 20 feet of pay sand and there was water encountered in that hole at a depth rather high in the formation.

Chambers No. 1 in Section 25-33-40, Morton County, indicated on the map, showed 1,500,000 at 2,575, with a showing of gas at 2,460. It is, therefore, put inside of the gas field.

P. E. Simmons No. 1, Section 16-32-39, one of the Panhandle Eastern's wells, indicated on the map, showed 2,900,000 at the time it was drilled, but it had already dropped to an open flow of 1,398,000.

It was acidized later to 11,312,000. It is a small well, a difficult well to operate, apparently only has about 17 feet of pay and is near the edge of the field.

Completely outside of the field in Morton County, Hydraulic Oil Company, Butts, in Section 22-34-43, northwest of Elkhart, Kansas, showed only a showing of gas at 2,296, 2,435, 2,508 and 2,960, apparently very little porosity.

The estimate for all of those showings for that well was three-fourths of a million cubic feet of gas. It was drilled to a total depth of 3,450, which, considering that it is high on the structure, makes it one of the deeper wells of the field, but was, for all practical purposes, a dry hole, and seems to condemn the idea of extending this gas field toward the west.

[fol. 4374] This Hydraulic Oil Company, Butts, is also shown on my geologic cross-section and has been studied very carefully by all of us who are interested in this field.

On up into Stanton County, very few wells have been drilled, but there is one.

Western Production Company, No. 1 Plummer, in Section 11-29-41, near the village of Johnson in Stanton County, Kansas, was completely dry as far as we can tell at a total depth of 3,005.

In Grant County, Colorado Utilities, Sullivan No. 1, in Section 12-29-38, indicated on the map southwest of Ulysses, reported 4 million cubic feet of gas but the State test in 1938 only showed 560,000.

In spite of that, I have included that as a part of the Hugoton Field. It was drilled to a total depth of 2,715.

In Hamilton County, Kansas, W. J. Sherry, Porter No. 1, Section 30-25-41, indicated on the map southwest of Syracuse in the region which is called by geologists the Syracuse anticline, was completely dry to a depth of 6,453.

There was a dry hole which was drilled on a structure mapped by the U. S. G. S., the United States Geological Survey, which apparently did not extend the Hugoton Field even into that favorable area.

By Mr. Littman:

Q. May I interrupt there to inquire, Dr. Bartle, the distance of the well that you last mentioned from the [fol. 4375] western boundary of your outline?

A. About 14 miles. Each of these (indicating) is a mile.

Q. I thought you were referring to the well up above, were you not?

A. I am sorry, yes, this well is 26 miles.

Q. What is the name of that well, now?

A. W. J. Sherry, Porter No. 1.

It happens that in the immediate vicinity of Syracuse and Lakin, there is a folio of the United States Geological Survey which was prepared many years ago, indicating the general geology of that region.

Q. How did you happen to draw that dashed line at a point approximately 26 miles east of that well that you just named?

A. On the basis of these other wells in Kearny County and in Grant County, obviously, that is much out of the area and it is only stratigraphic information that we can get from that.

However, I have no well 5 or 2 or 3 miles from the edge of the boundary, and I brought this in because it was located on a favorable geological structure and very deep but still unsuccessful. I brought it in for what it was worth.

In Kearny County, Tri-State-Campbell No. 2, Section [fol. 4376] 7-25-35, indicated on the map immediately southeast of Lakin, had 3,260,000 open flow at 2,462, 2,573, 2,670.

This 3,000,000 well was acidized to a total open flow of 9,500,000 and is, therefore, inside the area of the Hugoton Field.

In Finney County, Lone Star, Hamlin No. 1, in Section 31-24-34, indicated on the map, came in for 2,700,000, was acidized to 13,000,000 and is, therefore, inside the area.

In the same county, Kansas Pipe, Spratt No. 1, in Section 31-24-33, although it only came in for 800,000 in three different places at 2,533, 2,570, 2,680, was acidized to a total open flow of 4,600,000 and is, therefore, put inside the area.

In Haskell County,—I am almost through with this resume,—Kuhn-Neilson No. 1, in Section 21-28-32, indicated on the map north of the village of Sublette, came in for 1,750,000 at 2,716 and is put inside the area, although it is a very small well.

In the same county, Helmerick Payne, Trimpa No. 1, in Section 28-28-33, indicated on the map, made 3,000,000 open flow at 2,694, 2,715, 2,765, 2,882. Completed to a total depth of 2,978 and it is put inside of the gas field.

In the same county, Kuhn-Meridith No. 1, in Section 10-30-33, immediately northeast of the village of Satanta, made 100,000 only, 100,000 cubic feet open flow per day at 2,548, 2,650, 2,685, was drilled to a total depth of 2,782. [fol. 4377] In spite of that extremely small well, only a showing in any gas field, I put that inside of the gas area, gas producing area.

In Seward County, Vickers, Hitch No. 1 in Section 33-32-34, north of Liberal, came in for about 3,000,000, the exact amount not known because it was only estimated.

Other drillers at the same time estimated it to be dry entirely. The last gauge on that well showed 750,000, so evidently those who estimated it to be completely dry were wrong; but, at the same time, it is a small well.

The production was between 2,552 and 2,590, and between 2,640 and 2,715. It was carried to a total depth of 4,037 and is inside the gas field.

It is also one of the wells from which we have considerable subsurface information as shown on the geologic cross-section.

T. W. Slick Well, Pyle No. 1, in Section 14-33-33, in Seward County, indicated on the map, showed gas at 2,650, but there was no other showing although it was drilled to a total depth of 5,032.

It is, therefore, marked outside the field and the line is drawn between this well and the one immediately west, which had a small amount of production.

The Seward-County Oil, Sealy No. 1, in Section 20-33-33, indicated on the map, is the one to which I just referred, [fol. 4378] and showed 1,000,000 open flow at 2,654 and 2,689, 2,749; was drilled to a total depth of 2,764 and is inside the area.

I have gone around the field with you for the purpose of indicating the basis for such a dotted line and we have not closed off the possibilities of other wells being found outside the area.

On the other hand, we have included within the gas field a great number of wells and a considerable amount of acreage which seems to be rather small.

Mr. Lee: Dr. Bartle, may I ask a question?

The Witness: Yes.

Mr. Lee: Did you indicate only one Panhandle well in all that area?

Mr. Culton: He is just going around the edge.

The Witness: That is right. I was going around the edge of the field, and it happened that only one applied which belonged to the Panhandle Eastern Pipe Line Company.

By Mr. Littman:

Q. There has not been sufficient drilling in and about this Hugoton Field, Dr. Bartle, so that one can say that it can be defined with any degree of definiteness?

A. It is defined with a degree of definiteness which I indicated by going around. Of course, that is the reason we have the whole thing as a dashed line rather than as an absolute field-limit line.

[fol. 4379] You can see why I hesitate to ascribe the same amount of gas to all portions of the field.

Eventually, we will be able to classify this acreage, and we will be able to tell more accurately where are the good places in it and where they are not, because I have included inside the field wells which are little more than showings.

Q. When you used the term "good wells and poor wells", are you referring to the open flow?

A. Yes, as an indication of the productivity of the well.

Q. Now, while open flow readings would indicate the productivity, they would not necessarily indicate the volume of gas in the surrounding acreage, would it?

A. They certainly would indicate the volume of gas in the surrounding acreage. They would not establish it absolutely, but just the same as an oil well comes in for a large potential, it is presumably a better investment than one that comes in for a very small potential, so a well that has a large open flow can reasonably be expected to produce more than a well that has only a showing of gas. That is the error in our thinking, if you will pardon me, in disregarding the amount of open flow and depending entirely on pressure, because a little well is not as big as a big well.

Unfortunately, we do not have a perfect method of meas- [fol. 4380] uring that. We have to measure that by open flow, but that is the closest thing we have to a true potential of the productivity capacity.

Q. But you cannot make an estimate of gas reserves by a consideration of the open flow and nothing else?

A. There is a very good way of estimating reserves by the decline of open flow. It happens that it does not apply to this field because of acidizing of the wells, but there is such a thing as estimating gas entirely by the decline of open flow.

There is something to be said in behalf of that.

Q. You did not use that method in making your estimates of the reserves of the Hugoton Field?

A. Because recent acidizing changes the open flow conditions, but certainly the decline of open flow is something to be considered and certainly the capacity of the well is to be considered very much and it is absurd to say that a half-a-million cubic foot well is as good an investment

and that you can make as much return from it as from a 25 million foot well.

That is the kind of an absurdity that we fell into this morning, in my opinion.

Q. Is there a direct relationship between open flow and gas in place?

A. I do not know. Certainly there is some relation-[fol. 4381] ship, whether it is direct or not, it could not be established.

Q. How do you determine it or, let me put this question, how would you determine it?

A. How would I determine the gas in place? I determined it in my calculations here on the basis of porosity and the amount of gas under pressure and the amount of acreage available and that is the basis of my method.

That is the reason I chose that method. However, the open flow is certainly a factor, and I would not hesitate to use the decline of open flow method if it was not for the incidence of acidizing of these wells.

* * * * * * * * *

Q. You stated that there was some relationship between open flow and gas in place? A. Yes.

Q. Can that relationship be determined in advance?

A. Not absolutely, of course. Other things determine the amount of gas which can be extracted from a well. The open flow, of course, is a rough measure of permeability and that, of course, as we have indicated, is a matter of yielding and speed.

[fol. 4382] The time element that we discussed comes in there, but the actual amount of gas, of course, has to be there before it can yield, and there is certainly a relationship between big wells and big production, small wells and no production.

When your open flow is gone, the well is gone. If you have only a half-a-million to start with, half-a-million open flow, it is going to decline and be gone in a short time, of course.

Q. But how can you determine the amount of gas in place by knowing the open flow potential and nothing else?

A. I think you need to know all these other factors. You need to know the gas pay thickness. You need to know the area of the field. You need to know the porosity, as far as we can determine it.

All these other factors, I think, ought to come into a general study of the problem, but certainly one of the things that is important is the size of the well; and that is what open flow means, the size of the well.

Q. It means the deliverability of the well?

A. No, open flow is not exactly the same as the deliverability. Open flow is the theoretical factor determined by the pitot tube method described by Mr. Smith yesterday.

That is the theoretical figure that that gas well should yield to the air in 24 hours.

[fol. 4383] Now, actually, as a matter of fact, we do not want to leave these wells open, yielding to the air for 24-hour periods, and we would only take a percentage in any event, but that is the only term that we have for—I cannot think of the term they use in the oil industry—for the capacity of the wells, that is really what it means, for the capacity of the wells.

Now, deliverability depends upon other conditions. It depends upon the line pressure and the size of the hole and all these other things that would let the well yield from its open flow.

That is, their percentage. Open flow is not identical with deliverability. Mr. Hinton will be discussing deliverability at a later date.

My only objection to your thought is the assumption that a small well is as good an investment and will yield as much as a large well.

I do not know how much a small well will yield, but I am sure it will be less than a large well.

Q. Well, the only thing I wanted to make clear was, that you cannot make an estimate of the reserves in place, by measuring the open flow of a well.

A. Not until after it has had a history.

Q. That is right.

Now, at the bottom of Page 3 of your written testimony [fol. 4384] in Exhibit 36, you refer to the Northern Natural Gas Company and Panhandle Eastern Pipe Line Company providing the two chief markets since 1932.

A. Yes.

Q. For the gas produced in the Hugoton Field, do you not? A. That is right.

Q. Will you state the portion of gas withdrawn by each of these two companies from the Hugoton Field during the past few years in relation to the total annual withdrawals?

A. I can get that from the company records. I do not believe I have it in any of my exhibits.

Mr. Smith's paper has it, I believe. That is a matter of company statistics, which I am willing to discuss, although the company men probably could give it with less difficulty. I have Mr. Smith's testimony.

Mr. Culton: I do not know whether you understood his question or not. He asked you for the takes by Northern Natural and Panhandle Eastern as compared with all of the takes in the field. Is that what you are looking for?

The Witness: It is a very substantial amount of total takes of the field. I can give you the exact figures by thumbing through the company's records, if you want them.

By Mr. Littman:

Q. Perhaps you could give us that after the next recess? [fol. 4385] A. It is a large amount. I believe I am correct in my statement that these two companies take most of the gas from that field.

Q. I would like to have it separately as to each company for the takes.

A. Yes, I will check up on that.

Q. Is it your opinion, Dr. Bartle, that the ultimate boundary of the Hugoton Field will probably extend beyond the dashed line which you have shown on Exhibit 27?

A. It is my opinion that there will be gas discovered in the area beyond the dashed line. It is also my opinion that there will be some dry holes drilled within the area of the dashed line.

Of course, the magnificent thing about this thing is that, up to date, there has been no absolutely dry well. That cannot continue indefinitely, of course, in this extremely large area.

Q. But you do expect that eventually the boundary—

A. (Interposing) Will be changed.

Q. (Continuing)—will be extended?

A. Extended and constricted. That is the reason I dashed the line instead of making it solid.

Q. Do you think the total area will remain about the same in acres?

[fol. 4386] A. I do not know. I would be glad if I did.

Q. What do you think the probabilities are that it will eventually be a larger area than the 2,000,000, I think you said 2,540,000 acres?

A. I have no basis for an opinion that it will be either larger or smaller. That is an extremely large area already. I hope it will extend on over into western Kansas and Nebraska, but I doubt it.

Trial Examiner: I wonder, Dr. Bartle, if you studied the logs of explorations east and west of the present Hugoton Field?

The Witness: I have to some extent, sir.

Trial Examiner: Give us some idea of the extent of those explorations in each direction and your knowledge of them.

The Witness: They have not been extensive. They have not been intensive, of course. There have been a few scattered wells drilled in the vicinity of Dodge City, northeast of the Hugoton Field.

Trial Examiner: What are the distances that you have in mind now?

The Witness: Twenty, 25 miles away. There was a recent test for oil in Kearny County, northwest of this area, which is producing a small amount of oil at the present time.

Trial Examiner: Was there any gas in that well?

The Witness: Not that I know of. There is oil, though, [fol. 4387] from the formations deeper than the Hugoton Field.

Of course, the normal prospecting for oil in Kansas or for gas in Kansas, as a matter of fact, would probably not be from these Permian formations we are discussing, but from deeper Mississipian or Ordovician formations, and most of the wildcat wells would be looking for oil, of course, because it is more valuable.

Trial Examiner: Are the drilling methods such as would take them through it—

The Witness: (Interposing) Yes, they would.

Trial Examiner: (Continuing)—the formations that you have at Hugoton without discovery of gas?

The Witness: No, it has come to be the common custom of coring of the formations and I think that most wildcat holes in western Kansas would end up with some knowledge of the formations which produce gas in the Hugoton Field.

Up to date, none of them have opened up new gas fields at that horizon or any other, although there is that new oil.

Trial Examiner: What extent have those explorations reached in the west?

The Witness: There is, I believe, if I can indicate on the map, this new oil in Kearny County which would be, I believe it is in Townships 22, either 21 or 22, whereas the north line here is Township 24 and there has been one or two wells drilled there.

[fol. 4388] That is, in northwestern Kearny County, they had a showing of oil and now one that is just finally being called a well. Of course, there is the Shallow Water oil field in northern Finney County. It may be in Scott, but it is near the boundary line and that, of course, that is Mississipian oil production, three or four wells there.

Up to date, of course, those wells have not had a pipe line outlet and so the small amount of oil that they have had has been marketed only by trucking.

Trial Examiner: Do you consider the remainder of Stanton and Morton counties west of the field as eliminated?

The Witness: Perhaps not absolutely eliminated, but certainly it is very discouraging.

Trial Examiner: You do not look for gas discoveries in those areas?

The Witness: No. Immediately north in Finney County and in eastern Kearny County, of course, we could extend the field on, perhaps.

Mr. Culton: Dr. Bartle, is there any formation condition there on the west of the point that the Examiner is asking you about?

The Witness: Yes.

Mr. Culton: That would make you have that discouraging situation?

The Witness: My cross-section goes across the field to [fol. 4389] the Butts well that we mentioned in Morton County, and I have indicated on that cross-section that the porosity condition is less favorable.

This whole thing is a stratigraphic trap, of course, and if you do not have a dolomite or limestone that is porous enough to hold gas, why, the gas will not be there.

It seems to be accumulated on this monoclinal dip in the porous area, rather than due to any geologic fold or structual trap.

Trial Examiner: Your testimony indicates you would expect an extension to the north.

The Witness: A possibility to the north, yes, sir.

Trial Examiner: Rather than to the east or to the west.

The Witness: Yes, sir.

Trial Examiner: And I believe someone has stated that the geologists do not expect the Hugoton and Panhandle fields to connect, I mean by way of production.

The Witness: That is entirely a matter of definition. These dry holes in Hansford County which I pointed out would indicate that if there is a connection, it has to be around about a semicircle toward the west.

Trial Examiner: You would not say then, that the area between the two fields is wholly eliminated or wholly explored?

The Witness: That is the reason we indicated this area [fol. 4390] in Sherman and northern Hansford County as part of the field, and that is why, I believe, Panhandle Eastern has certain acreage in that region.

By Mr. Littman:

Q. Your estimate of the remaining gas content of Panhandle Eastern's leases in the Hugoton Field and of the leases under gas purchase contract in that field, exclusive of the reserves on which Argus Natural Gas Company has first call, is shown in Schedule 3 of your Exhibit 36, is it not?

A. I believe so.

Q. Do the reserves shown at the foot of each of the Columns D, F, H and J on Page 2, and Columns D, F, H and J on Page 3, represent recoverable reserves at the assumed abandonment pressure shown at the top of those columns?

A. At an abandonment pressure shown at the top of the column and a recovery factor of 90 percent, that is right.

Q. And you have shown the estimate of reserves upon eight different abandonment pressures, have you not?

A. Yes, sir.

Q. Ranging from 150 pounds down to zero pounds abandonment pressure?

A. At the well head, yes, sir.

Q. Why do you submit these eight estimates on these various abandonment pressures rather than one estimate?

A. I do not know when the wells will be abandoned and [fol. 4391] so, for your convenience, I estimated it at eight different abandonment pressures.

Q. Do you have any opinion as to the pressure at which it is expected the wells in the Hugoton Field will be abandoned?

A. No, I have no opinion as a geologist on that point. I think that depends upon the conditions of operation, the economic factors involved, rather than the geologic factors.

[fol. 4392] By Mr. Littman:

Q. Dr. Bartle, referring again to Schedule 3 of Exhibit 36 in Column D, you show the original amount of gas for the various classes of acreage, do you not?

A. Yes, the classification there is not on the basis of productivity as Mr. Smith's classification was in Texas, but on the basis of ownership.

Q. That is, you had one class of acreage with respect to the original amount of gas?

A. That is right. This is a matter of company ownership and drilled and undrilled. The classification then is an arbitrary thing depending on the progress of the company at any one time.

Q. And you used as your original amount of gas per acre the figure of 9541 m. c. f. per acre, is that correct?

A. That is correct, at sand face.

Q. Before going into your method of arriving at 9,541 m. c. f. per acre, I would like to ask why you haven't included in your estimate the reserves which are subject to the Argus Natural Gas Company's contract?

A. I show that in a separate table which is in the same exhibit, Schedule 4, page 2: That also is a matter of convenience on the basis of company ownership and dedication.

Mr. Culton: And the estimated remaining reserves are shown on page 3?

[fol. 4393] The Witness: That same schedule, pages 3 and 4, is the remaining gas content in the Hugoton field under dedication to the Argus.

By Mr. Littman:

Q. I would like to have you explain step by step how you arrive at the estimate of 9,541,000 cubic feet per acre of original amount of gas.

A. I used the porosity pressure method, porosity method which has been referred to. I estimated the average gas pay in this field as 40.4 feet. I estimated the porosity as 18.6 per cent. I calculated the initial absolute bottom hole pressure as 478, and took as the pressure we wanted 16.4, so my equation is 40.4 times 18.6 times 43,560, which is the number of square feet in an acre, times 478, divided by 16.4, which makes a total amount of gas at sand [base] of 9,541

m.c.f. That is gas pay times porosity, times the number of square feet in the acre, times the absolute pressure divided by the surface pressure, which gives the result in gas per acre at sand face.

Q. Will you please explain how you arrived at an average pay thickness of 40.4 feet?

A. In 1939, in the preparation of an article which I wrote with Mr. Smith, company geologist, which article was published in the American Association of Petroleum Geologists bulletin of that year, I made a study of the logs [fol. 4394] of all of the wells for which there was any reasonably accurate log available. There were 183 at the time in the Hugoton field, scattered over the Hugoton field.

* * * * * * * * * *

Q. Can you state how many wells there were?

A. At that time, yes, there were 285 wells at that time.

Q. And 183 of that number whose logs were intelligible?

A. That is right, with respect to the gas pay, in my opinion. At that time I got an average gas pay of 40.4 feet. Since that time I have examined logs of other more recently drilled wells and made an effort to see if that is about the proper gas pay thickness. New wells seemed to substantiate that and so I used the same figure which I had in 1939. This, then, is on a basis of an average of 183 wells in 1939, verified by an examination of thirty or forty more wells since that time.

Q. How many of Panhandle Eastern wells, both owned and controlled, are included in those 183, approximately?

A. Most of them; we wouldn't know exactly because we took all the wells in the field that had a log that was in- [fol. 4395] telligible. Panhandle Eastern wells in the main are well drilled. It is possible that some of them in the early days of the drilling didn't have complete information. I didn't select them because they were Panhandle Eastern wells or leave them out because they were not; I was trying to get the situation in the field as a whole.

Q. I gather from your testimony that 40.4 feet of average pay thickness is the average for the entire Hugoton field, is it not?

A. That is my opinion.

Q. And doesn't necessarily represent the average of Panhandle Eastern acreage?

A. I believe it does represent the average of Panhandle Eastern acreage, since Panhandle Eastern wells are scattered all over the field and represent a substantial number of this total of 183, so I believe that is a fairly accurate figure; not absolutely accurate, of course, but fairly accurate figure for the field as a whole, or Panhandle Eastern wells.

Q. Would you say that Panhandle Eastern acreage is located in better portions of the Hugoton field or merely the average portions?

A. When there were wells drilling in the Hugoton field and there was a lot of territory in the whole field undrilled, it is to be expected that every producer would cluster [fol. 4396] around the larger wells.

After those wells were drilled pipe lines were laid into those good areas, so that the development of any gas field, including this one, is not regularly scattered over the whole field, but in the region where good wells were drilled at an early date, and where pipe lines were laid, so that these people have a connection for their wells.

Now, with that in mind we will get what we call our sweet spots developed early, and in order to continue the same degree of productivity it will be necessary for other sweet spots to develop.

Now, as far as Panhandle Eastern's own wells and gas purchase wells are concerned, they are not scattered equally throughout the whole field, but, I believe, are as advantageously located as the average in the field, and that the average in the field is clustered around what I have described as sweet spots.

Trial Examiner: The real picture, Dr. Bartle is, am I right, the acreage within this entire field as you have defined it on this map marked for identification, Exhibit 27, I believe, is pretty thoroughly consolidated at the present time?

The Witness: That is right.

Trial Examiner: And the developments have, naturally, as you say, extended out from the best early wells?

[fol. 4397] The Witness: That is right.

Trial Examiner: And is now subject to further extension as market demands develop for more oil?

The Witness: That is right.

Trial Examiner: And while the field is now well known in this area near Hugoton there have been no developments around, for instance, Guymon, which would entitle you now to chart that area in great detail, as you are able to do in the Hugoton area?

The Witness: It happens, Mr. Examiner, that your illustration is not exactly accurate. In fact, there were early wells at Guymon; if you had taken any other place on the map what you say would have been entirely correct, but there has been a little unusually good information in that region.

Trial Examiner: Well, your holdings indicate that you believe in the Guymon area, as you have indicated on the map there.

The Witness: That is right: Other places in the gas field will be developed as the market needs require and as large wells are developed in any certain area.

Trial Examiner: You say "needs," you mean the development of further markets?

The Witness: Yes.

By Mr. Littman:

[fol. 4398] Q. Dr. Bartle, I don't believe you have answered my specific question—

A. And that question was—

Q. (Continuing)—as to whether, in your opinion, the acreage owned and controlled by Panhandle Eastern Pipe Line is located in better than average portions of the Hugoton field, that is, as you have outlined it in Exhibit 27.

A. I don't believe that we have any right to say that it is better than the average in the withdrawn area.

Now, we have already admitted we do not know how much will be produced from the area which is outside of the withdrawn area, making up three-quarters of the field,

so that I think that our average for the other wells in comparison, for instance, with the Northern Natural wells, I think would be about the same.

Q. Now, how did you determine the average porosity of 18.6 per cent which you used in arriving at your estimate of gas reserves?

A. An average porosity figure is, of course, a judgment figure. I was influenced in making my judgment of the average porosity by a study of the gas producing formation, by a microscopic study of samples; by a comparison of the strata found in various portions of the field, and by the behaviour of the wells, as indicated in the series of maps showing the pressure decline; by a comparison of the porosity of other fields, and as careful an analysis of [fol. 4399] the field as a whole as I was able to make.

The figure 18.6 per cent happens to be the same figure which I used in 1939 in the publication previously cited. I wouldn't hesitate to change that figure, however, if I found evidence indicating that the porosity was either larger or smaller.

Q. The figure of 18.6 per cent suggests, Dr. Bartle, that it is a calculated figure, and I am wondering whether you didn't have a certain calculation to arrive at that figure.

A. In the 1939 publication it was a calculated figure; I would have no hesitation, however, in changing that percentage if I saw any grounds for so changing it. I believe that the behaviour of the wells is one way of knowing something more about the field than simply the porosity.

Q. Will you please state the method whereby you calculated the figure of 18.6 per cent in the first instance?

A. By use of the pressure decline method and the estimate of the thickness of the pay. It seems to me that the behaviour of the wells were such as to justify that estimate of 18.6 per cent porosity, in relating this to the behaviour of wells. However, that is not the only indication that I get for the percentage, 18.6.

Q. Well, Dr. Bartle, I believe you said that you calculated this figure of 18.6. I take it by that you mean that you [fol. 4400] had certain figures and made certain calculations and arrived at a precise amount of 18.6 per cent. Now,

what I want you to state for the record is how you arrived at this 18.6; give us the calculation.

A. In the 1939 paper, or in this series of maps which I have submitted of the same type, which is much better evidence—

Q. You arrived at 18.6 per cent for the first time when?

A. In 1939.

Q. Will you give us the calculation you used in arriving at this 18.6 per cent?

Mr. Culton: You are now looking at the same document, a copy of which Mr. Littman has before him.

A. "Relative Porosity and Permeability of producing formation of Hugoton Field, Kansas, as indicated by gas withdrawals and pressure decline."

Mr. Culton: Yes, the same document that Mr. Littman has a copy of?

The Witness: I think so. In 1939 we believed that that Hugoton field of Kansas only showed a withdrawal area of 379,200 acres; a withdrawal of gas of 161,300,368 m. c. f.; a withdrawal per acre of 425 m. c. f.; an initial rock pressure of 435 pounds per square inch; an averaged weight rock pressure in the withdrawn area of 416.33 pounds per [fol. 4401] square inch; a withdrawn per pound decline of 8,959,029 m. c. f., which would make a calculated initial reserve of 3,897,177,615 m. c. f., which reduced to acreage would make a calculated initial reserve per acre as of that time of 10,277 m. c. f., or 10 million cubic feet per acre.

This would indicate an amount of gas which reduced in volume by pressure would occupy a space seven and a half feet in thickness, and since production is believed to be from a formation 40.4 feet in thickness, it would [indicated] a porosity of approximately 18.6 per cent in order to establish that much space.

Q. In other words, Doctor, as I understand your testimony, you arrived at this figure of 18.6 per cent of porosity by the use of the rock pressure decline method?

A. Yes; I said that in the first place, we used that originally in 1939; as a matter of fact, the name of the article is, "Relative Porosity and permeability of produc-

ing formation of Hugoton Field, Kansas, as indicated by gas withdrawals and pressure decline."

Now, in order to establish the true porosity, other factors should be considered. I have enumerated those, certainly including the factor of the reasonableness with respect to other gas fields withdrawals as they have been taken from abandoned gas fields; all of those other factors.

Q. Do you consider those factors to represent reliable [fol. 4402] criteria upon which to make a determination of porosity?

A. Why, yes. The whole problem of establishing of this porosity is a matter of judgment. It might be a little different from 18.6; maybe that is misleading in assuming a pretense to accuracy; however, it is about right. The whole problem of establishing porosity is a severe one. We have had great long discussions here the last few days about cores.

Now, obviously a core is only for a small area and particularly in a limestone or dolomite reservoir there could be great variation a short distance laterally from that core. As a matter of fact, there is even a great variation within a core itself, so that doesn't mean very much. The only way that we could tell what the porosity has been is after all the gas has been withdrawn from it. If then the limits of the field are known it is possible to go backward on the proposition and see what the effective porosity must have been. As a matter of fact, I have done that in cases of abandoned fields near Kansas City, and I expect to do that more so.

I hope eventually if we can get enough men reporting back about abandoned gas fields, that we can really establish this business of porosity to where a judgment figure is more accurate all the time. In the meantime we have to do the best we can.

[fol. 4403] Q. Isn't it a fact, Doctor, that along with the volume you must have pressure?

A. Of course.

Q. Now, Dr. Bartle, in the calculation which you have just given us you found from your data that the initial

reserve per acre in the Hugoton field was 10,277 m. c. f., is that correct?

A. That is right.

Q. And you, as a matter of fact, relied upon that figure?

A. Not particularly.

Q. Well, in the calculation for the purpose of arriving at your 18.6 per cent figure, is that correct?

A. Yes.

Q. Now you have used what amount of initial reserve per acre for the purpose of your present estimate?

A. Nine million five, instead of ten million two.

Q. Well, is [ ] the 10,277 m. c. f., an accurate figure to use for purposes of calculating the precise porosity figure which you are using in this proceeding?

A. I have never contended this was a precise figure and do not now contend. As a matter of fact, we are not going to worry a great deal about the difference between nine million five and ten million two; the difference is due to more careful calculation.

[fol. 1404] Q. In the 1941 figures of the absolute pressure?

A. I plead guilty to a slight difference, and I believe I was a little off in the absolute pressure in 1939, and I believe I am a little more accurate now.

Q. But you didn't reflect any of that in arriving at your 18.6 per cent porosity, did you? It doesn't seem to affect your 18.6 porosity?

A. That is right. There is a little difference in the absolute pressure which makes that difference; it is a matter of no moment, in my opinion.

Q. Well, have you calculated how much more gas you would have secured by way of an estimate on the Hugoton field had you used the initial reserve of 10,277 m. c. f. per acre instead of 9,541?

A. I haven't made that calculation. This is a matter of order of magnitude, and I am perfectly willing to be convinced that 18.6 is not quite right. I am perfectly willing to plead guilty to changing these figures on the basis of the absolute pressure. I regard that of no particular importance considering the order of magnitude involved. If it would please you any better to take 19 per cent or 18½ per cent, I don't believe it would be quite as good, but we wouldn't worry much about it. 18.6 per cent is a little less

than 20 per cent, as Mr. Smith has discussed it in the Texas field.

[fol. 4405] It seemed as to the amount of gas which has been produced in certain other abandoned fields—I believe it to be about correct; an estimated figure.

Q. The thing I would like to have you straighten me out, Dr. Bartle, and which disturbs me is this: if the rock pressure decline method is good and sufficient for the purpose of arriving at a percentage of porosity, why isn't it good enough for the purposes of arriving at an estimate of reserves? Why use that method in the first instance?

A. If you are going to make a study of a field you want to get all the information you can about it; you want to know about the stratigraphy, the formations, how they are laid down; you want to know all you can, all about the thickness of the pay, which is not an accurate figure, but which you have to estimate as best you can.

Q. You don't have to know anything about the thickness of the pay if you make your estimate by the rock pressure decline method, do you?

A. You must.

Q. But you don't use it in the calculation of reserves under that method?

A. You use it very directly—and that was the error we fell into this morning—you use it directly in so far as the gas pay was the thing that makes the space in which the gas has to be held.

[fol. 4406] Q. But you don't estimate thickness in arriving at your estimate by the rock pressure decline method, do you?

A. If you are using it as a simple engineering method, disregarding entirely the voids, why that doesn't appear in your arithmetical average, but as a matter of fact, the greatest weakness of the rock pressure method is that you don't know the size of the gas reservoir and certainly the thickness of the gas pay is a matter of the greatest importance in establishing the size of the reservoir.

The greatest weakness of the rock pressure decline method is in estimating the size of the reservoir.

Q. You don't need to know the size of the reservoir to determine the volume of gas that is contained if you have

the proper initial pressure and the proper present pressure?

A. Oh, yes. If you don't know the size of the reservoir then you don't know how much you are getting per pound rock pressure decline.

Q. Assuming a tight container.

* * * * * * * * *

[fol. 4407] The Witness: If you had a tank buried underground that was completely empty or a tank completely filled with gas so that there is complete communication in that tank, nothing to stop it, you could estimate the size of the container in that case by withdrawal of the gas subject to certain corrections and modifications by following Boyle's law.

Now, the greatest weakness of the rock pressure decline method is the fact that you do not have such a tank, and the tank consists of all this scattered gas pay thickness of which we have been talking.

Q. Well, you don't have to know the size of the tank in your sort of case.

A. Yes, you calculate the size of the tank; that is the purpose of the method, otherwise the whole thing doesn't make any sense.

Q. Suppose you give me the factors that you have to [fol. 4408] know in order to make a determination of initial reserves by the rock pressure decline method, just as you have done in your article; and I note that you do not have in your article, in your calculation of how you arrive at this figure 10,277 m. c. f. of initial reserves per acre, any showing of the size of the container.

A. You have the volume of the gas; the calculated volume of the gas.

Q. That has been withdrawn?

A. No. The calculated volume of the gas there in the first place, and that certainly fits into a container. The container happens to be scattered through a lot of rock formation; that is what we mean by the volume; the calculated volume.

Q. Well, you enumerate the things you must have in order to determine reserves by the rock pressure decline

method. You have got to have, first, the initial rock pressure; is that correct?

A. Yes.

Q. That is what I am trying to get at. I want you to give me the figures you have to have.

A. You have to have the initial pressure, which should be the virgin pressure of the field.

Q. What else?

A. The amount of gas that has been withdrawn; the [fol. 4409] total measured and unmeasured gas withdrawn from the reservoir; you have to have the equilibrium pressure of the gas—

Q. That is the rock pressure reading?

A. In the equilibrium for that field. I would like to talk more about that. Shall I do that now?

Q. I wish you would continue with your list and elaborate later.

A. All right. From the amount of gas which has been withdrawn and the amount of loss of pressure you can divide and find out the loss of pressure per pound drop. Now, that gives you a method which is not exactly accurate of estimating the original calculated volume.

Q. Now, what is that method called?

A. Multiplication.

Q. Isn't it called rock pressure decline method?

A. Multiplication is what we are talking about now. You get the amount of gas withdrawn per pound, or per ten pounds—whatever you are using—and multiply that out and find the calculated initial volume of the gas. Now that certainly fits into a container; it comes from a container. If you want to figure how big that container was under the ground it is a matter of porosity. If it is not under the ground, if it is in the tank, it is a matter of cavity.

Q. But, Dr. Bartle, you had arrived at the amount of gas remaining before you even mentioned anything about [fol. 4410] the container, isn't that right?

A. The amount of gas remaining—

Q. Well, the original gas contained had been arrived at by you in this calculation without any reference to the volume or size of the container. You calculated the size of the container; that is what you are doing on all this process, calculating the size of the container.

A. Of course, that is subject to certain inaccuracies. Shall I take that up and talk about that now?

Q. Well, it is accurate enough for you to determine a porosity figure, is it not, as you did in 1939 in your article of 18.6?

A. It is accurate in so far as it reflects the history of the field; it is worth something in determining porosity.

Q. And it was good enough for you to stand by it?

A. Sure, I stand by it, now. That is the reason I made this much better series. I made a series of five maps as to the behaviour of the wells because I think that is a matter of importance in turning out the picture of this field.

Q. Nothing has happened since July 1, 1939, as of which date you calculated the initial reserve per acre of 10,277 feet to cause you to change your—

A. Percentage?

Q. Your porosity figure of 18.6 per cent, arrived at by the use of the rock pressure decline method; is that correct?

[fol. 4411] A. Of course, I have in evidence here much more detail on that point. We calculated the thing in 1932, 1938, 1939, 1940, and 1941. Those figures are in evidence.

Q. Yes, they were in your exhibit.

A. That is right.

Q. Let us take a look at that for a moment. You say that is on what page of Exhibit 36?

A. That is schedule 1, pages 1 and 2. They are calculations for the various years beginning in 1932, skipping to 1938, in order not to duplicate unnecessarily.

This is the story of the behaviour of the wells and I certainly believe that behaviour of the wells ought to be considered in such a study. However, I have to go back to the geologist's method of calculating a reserve after studying the behaviour of the wells.

Q. Now the figure of 9,541 cubic feet which you have adopted for the purpose of estimate—

A. Is not identical with any of these figures.

Q. It is lower than any of these figures, is it not? Isn't that a more accurate way to put it?

A. The 9,541 was used there, and this is 9,568. I believe that is 27 lower than the other one.

Q. It is not lower than the lowest of the years, but it is considerably lower than the most recent experience as in-
[fol. 4412] dicated by years, and shown by the year 1941, is it not?

A. Nine million seven was in 1941, compared with nine million five. I wouldn't say a difference of less than two per cent is of considerable moment in a calculated figure. I think we are getting pretty close together. If it was 50 or 75 per cent difference it would be something to talk about, but I think as long as we are talking about something less than two per cent it is not very important; I think we are in pretty much agreement. I have no pretense that my figure of nine million five is within two per cent of accuracy, or that any other such figure is ever going to be within two per cent of accuracy.

The chief difficulty, of course, is getting at equilibrium pressure, and the weighted rock average is only one way of getting at that figure. I used that method because we don't have any better: As a matter of fact, a deviation from Boyle's law is more than three per cent, because natural gas is not a perfect gas.

Q. Does the temperature correction tend to compensate the difference?

A. From Boyle's law, yes. It doesn't exactly compensate, the main problem is getting the equilibrium pressure.

Q. Do you have any interest in the production down there in the Hugoton field?

A. I have some interest in gas wells when they are paid for.

[fol. 4413] Q. To whom do you sell gas?

A. To Panhandle Eastern.

* * * * * * *

Louis F. Sperry, a witness, having been previously sworn, resumed the stand and testified further as follows:

[fol. 4561] Cross-Examination

By Mr. Littman:

Q. Mr. Sperry, you are the Treasurer of Panhandle Eastern Pipe Line Company, are you not? A. I am.

Q. How long have you occupied that position?

A. Just short of five years.

Q. What position, if any, did you occupy with Panhandle Eastern Pipe Line Company prior to that time?

A. None.

Q. Do you hold any other position besides that of Treasurer? A. No.

Q. You have prepared Exhibit 74 which summarizes your direct testimony, have you not?

A. I do not know to what you refer. You mean those four or five short summaries—

Q. (Interposing) Yes.

A. (Continuing)—that I put in supplemental to my original testimony?

Q. Yes.

Mr. Wheat: That is Exhibit 74, the four typewritten sheets of summary.

The Witness: I did not know it had been given a number, but that is true.

* * * * * * * * * *

[fol. 4562] Trial Examiner: Thank you.

By Mr. Littman:

Q. And your testimony in this case has related, thus far, to the subject of working capital, has it not?

A. That is right.

Q. Will you please turn to Exhibit No. 74?

* * * * * * * * * *

The Witness: I think I have a copy here, yes.

By Mr. Littman:

Q. Is my understanding correct that Table 3 of Exhibit 74 enumerates six items which make up your estimate of the total requirement for working capital for Panhandle Eastern Pipe Line Company and its affiliate, Illinois Natural Gas Company? A. That is correct.

Q. Now, the total estimate for working capital is $1,569,000, is it not? A. That is correct.

Q. The first item listed on Table 3 is "Normal cash funds for operating expenses", in the amount of $470,000, is that correct? A. Yes.

[fol. 4563] Q. How was this allowance determined, Mr. Sperry?

A. I took figures initially from the annual cash reports of the company which outline the amounts of cash actually expended by months by the corporation for all purposes.

I took from this schedule the total aggregate amounts by months for such expenditures of the total as are applicable to this case, and that gave me the total amounts expended by months for the period in question.

I then subtracted from such amounts any items which are not properly included in the working capital requirements, such as are included in a rate base, and I found that over a period of a year and a half prior to June 30, that we had paid out for purely operating expenses a total of $5,609,600.

Q. You mean June 30—

A. (Interposing) 1941, which is the cut-off date on my testimony, which is approximately $311,666 monthly.

I corrected that figure of $311,000-odd monthly for an estimated 45-day period, which makes that amount approximately 467,000, which I then rounded out to $470,000, the figure you mentioned.

Q. Now, you just spoke of "cash reports". Are you referring to the company's cash book?

A. No, I am referring to the annual cash forecast, which the company prepared every month for my purposes, which is transcribed from the cash books of the company. It is a summary of those books.

[fol. 4564] Q. You now use the term "forecast."

A. Yes.

Q. Does that represent the actual cash expenditures?

A. Yes, it represents actual cash expenditures for those months of the year which have elapsed and a forecast of our cash requirements for estimated expenditures for the balance of the year.

In other words, these cash forecast reports are prepared on a 12-months' annual basis, so many months actual, so many months estimated, to the end of the year.

I have used only those months which have elapsed and which show the actual amount of cash expended during those months.

Q. What is the source of those actual cash expenditures?

A. Those are taken directly from the cash books of the company.

Q. Were those cash reports prepared by you?

A. No, they are prepared in my Department, in the Accounting Department, the Treasurer's Department.

Q. Now, if I correctly understand your testimony, the figure which you first secured was the sum of $5,609,600 for an 18-months' period prior to June 30, 1941, is that correct? A. That is right.

Q. Now, that sum was secured after making certain deductions, was it not?

[fol. 4565] A. That is correct.

Q. Now, who made the deductions? A. I did that.

Q. And those deductions were subtracted from the total amounts shown in the cash reports, is that correct?

A. That is right.

Q. Then you took 45 days of that total 18-months' period to secure the sum which you rounded out to $470,000, is that correct? A. That is right.

Q. The mathematics of that would be taking 45 547's of $5,609,600, is that right? A. That is right.

Q. Now, will you enumerate the items that are included in this sum of $5,609,600 which represent the entire amount before allocation to the 45 days, and will you also enumerate the items that you excluded?

A. Included in the total are gas expense—

Q. (Interposing) And by gas expense—

A. (Continuing) Expense for gas purchased or produced.

Q. The actual cash payments?

A. Actual cash payments by months.

Q. For all gas purchased during the 18-months' period?

A. All gas purchased or produced, yes; other operating [fol. 4566] and maintenance expenditures.

Q. May I ask you to explain what you mean by that latter class?

A. Included in that would be the chief operating expenses of the company, including wages, overhead, and direct expenditures for operations.

Q. That includes overheads? A. Yes.

Q. Does it include payments for wages? A. Yes.
Q. Does it include ordinary maintenance? A. Yes.
Q. And other general operating expenses?
A. That is correct.
Q. What else does it include?
A. Regular construction expense on which no interest is charged during construction. That regular construction expense is of the nature of maintenance and the taxes.
Q. What taxes are included?
A. Included in the compilation is such taxes as production taxes, franchise, sales, workmen's compensation and unemployment taxes.

As I will indicate in a minute, certain other taxes are deducted from this compilation.

Q. Now, have you completed your enumeration of all of the items that were included?
[fol. 4567] A. Those are the only classifications included.

Now, excluded from those total cash expenditures are certain taxes such as ad valorem, income taxes and capital stock taxes, both Federal and State; also excess profits taxes.

Also excluded from the above cash expenditures are any amounts which we had paid during those months for materials and supplies, and any amounts which we had made on account of prepayments, the reason for those latter exclusions being that we have made separate claim for those items later on.

Q. You did not want a duplication?
A. We did not want a duplication.
Q. Will you proceed with the other deductions?
A. Those are all.

Mr. Culton: You deducted interest and sinking fund?

The Witness: The interest and sinking fund were not included. These are purely operating expenses.

By Mr. Littman:
Q. Didn't you also deduct capital items upon which interest during construction was charged?
A. They were never included.

Q. Weren't they included in the cash book?

A. Yes, but they were not included in this compilation. Such items as expansion construction, interest, sinking fund, preferred stock dividends, common stock dividends, other capital items of that kind were never in-
[fol. 4568] cluded.

The amounts that were included originally were purely operating amounts.

Q. When you use the term "included", what do you mean by that?

A. Included in the amount which you have described as $5,000,000-odd.

Q. That was the final amount you got after making the deductions? A. Yes, that is correct.

Q. That is, $5,609,000-odd figure is a net figure after deductions, is it not?

A. That is correct, but it does not include any items of a capital nature.

Q. I understand that to be your testimony, Mr. Sperry, but isn't it a fact that the amounts expended by the company for capital items upon which interest during construction was charged do appear in the cash book?

A. Yes, they go through the cash book, but they do not go in the cash book under the operating items which I have just enumerated.

Q. Who makes the exclusion in that regard?

A. The operating department, that is, the accounting department.

Q. In other words, the cash reports which you receive did not include any capital items in which interest dur-
[fol. 4569] ing construction was charged?

A. Yes. Let me clarify that.

The schedule from which these figures were taken is divided into two parts; first, operating expenditures, or expenditures of an operating nature, from which I have taken these figures and; second, in a separate classification, capital expenditures or non-recurring expenditures of a capital nature, and the second half of that report I have not used here at all. The figures I testified to are purely operating figures.

Q. What would you say of the item which you did include of normal, regular construction expenses?

A. That is of the nature of maintenance. That is a recurring item which we pay out every month, construction needed to keep our present operating facilities in good condition, and it is simply another form of maintenance.

Q. Aren't such items eventually charged to the capital account? A. No, in many cases they are not.

Q. In some cases they are, are they not? A. Yes.

Q. When are they and when aren't they?

A. I think ultimately the large percentage of them go into our capital account.

Q. Yes.

[fol. 4570] A. But during the period covered by this report, that is, the month to month expenditures, they are not put into our property account.

Neither is any interest charged on account of construction.

In other words, it is money that we expend every month which does not appear in our rate base, and on which we get no credit unless it is included in the working capital for rate making purposes.

Q. Then when this cash report comes to you, there has already been made a segregation as between the normal regular construction expenses of the nature of maintenance on which no interest during construction is charged, according to your testimony, and the capital items upon which interest during construction was charged, is that correct? A. That is right.

Q. You did not make that segregation yourself, did you? A. No.

Q. We will come back to those items a little later. I wanted at this time only to have you summarize the items that were included at Page 457 of the transcript.

You testified, in part, as follows, and I am starting with the last sentence on that page:

"Excluded from this consideration were amounts paid for materials and supplies, pre-payments and ad valorem, income and capital stock taxes as well as payments for interest, sinking fund and other capital expense items".

[fol. 4571] A. That is right.

Q. Now, it was that statement, Mr. Sperry, that led us to believe you had first included and then deducted it.

A. Yes, I can see you might have had that impression. As a matter of fact, capital items such as interest, sinking fund and dividends, were never shown on this schedule.

Q. They were shown on the schedule?

A. No, they were never shown on the schedule.

Mr. Culton: Do you mean they were not shown on the schedule which you prepared for this case?

The Witness: That is right. They have no part in it and they are no part of my working papers.

By Mr. Littman:

Q. But they are shown on the cash reports?

A. They are shown on the cash reports to which I refer as the source of this information.

Q. That was the report that I referred to.

A. Yes. If you will notice my working papers, you will see there are no items of a capital nature, no interest, no sinking fund or dividends, certain operating expenses less certain deductions—let me show you the record from which I took these items.

Q. In other words, you are now handing me one of the cash reports?

[fol. 4572] A. That is the cash report which I used constantly—

. . . . . .

Q. Now, this is an annual cash forecast by months to December 31, 1940, compiled as of January 3, 1941, for Panhandle Eastern Pipe Line Company, and subsidiary companies, is it not? A. That is correct.

Q. Now, you were going to explain some of the figures on this sheet. Will you please do it in such manner so the record will show?

A. I indicated to you that the figures used in my study for purposes of this case were operating figures taken

from the first half of this schedule, the upper half of this schedule, and that such items of a capital nature as interest, sinking fund and dividends were no part of it.

Those appear in the last part of the schedule.

Q. I see.

A. The figures that you have been using from my working papers include no interest or capital items.

Q. You do not mind if we keep this cash report, do you, Mr. Sperry? A. Not at all.

Q. Am I correct in understanding that this cash report [fol. 4573] to which you just alluded and the title of which I just gave, was not a part of your working papers?

A. No, that is not a part of my working papers. That is part of the books of the company.

Q. Now, will you please state how much of this amount of $5,609,600 applies to the year 1940, and how much to the first six months of the year 1941?

A. That part which applies to the year 1940 was $3,391,400, and that part which applied to the first six months of 1941 was $2,218,200.

Q. Mr. Sperry, did Panhandle Eastern Pipe Line Company own any distribution systems in 1940?

A. I believe that we had, I guess, during all of 1940, I believe we owned a small distribution system called the Central Distributing Company.

Q. What was the full name of that company?

A. Central Distributing Company.

Q. Does Panhandle Eastern Pipe Line Company now own that distributing company?

A. No, it disposed of it sometime, I believe, in 1941.

Q. What towns and communities did Central Distributing Company, which you named, operate in, in the year 1940?

A. A number of small and scattered communities in Missouri and Kansas.

Q. Now, what product did the Central Distributing Company distribute?

[fol. 4574] A. It distributed natural gas.

Q. In the year 1940? A. That is correct.

Q. Do you know how many customers it served in 1940?

. . . . . .

[fol. 4576] The Witness: Here is approximately the information that you wish. These figures would indicate that Central Distributing Company had around 4000 meters altogether.

Mr. Wheat: When, Mr. Sperry?

The Witness: That apparently was in June, 1940.

By Mr. Littman:

Q. I think that will serve the purpose for the present, Mr. Sperry, and give us some idea as to the size of the distribution system owned by Panhandle Eastern Pipe Line Company through its subsidiary companies in 1940, and I believe you have testified that Panhandle Eastern has [fol. 4577] since disposed of these distribution systems?

A. That is correct, as of January 1, I believe, 1941.

Q. Now, the figures which you used in compiling your estimate of working capital include, do they not, the operating expenses of those distribution systems?

A. That is correct, for the year 1940.

Q. But not for the year 1941 because of the disposition of that company as of January 1, 1941?

A. That is correct.

Q. Now, Mr. Sperry, Panhandle Eastern Pipe Line Company does not propose to go into the business of distributing gas in communities, does it, at least not for the present? A. Not that I know of.

Q. Am I correct in understanding that your working capital figures include the 45 days allocation of payments for wages by the Central Distributing Company during 1940?

A. Included in my figures for 1940 are the Central Distributing figures to the extent of about $4,000 per month.

Q. For the year, that would be close to—

A. (Interposing) Around $48,000.

Q. Around $48,000?

A. To that extent, there may be some distortion in there.

Q. Now, the $48,000 that you are referring to, is that after allocation?

[fol. 4578] A. That is making no allocation. The amount involved was so inconsiderable and the labor involved of

taking them out of the consolidated figures from which I was working was so great that I did not think it was worth while doing it.

Q. Well, if you had eliminated this $48,000, what effect would that have had upon your estimate of working capital? A. Very little.

Q. Well, whatever effect it would have had, it would have served to decrease your total estimate, wouldn't it?

A. By about $6,000 aggregate,—no, it would be less than that. It would be materially less than $6,000 aggregate, because my study was made as of an 18-months' period, and there is a total of perhaps $48,000 distortion in the 18 months.

Q. Well, however small the amount, it does not belong in this working capital study, does it?

A. I believe my inclusion of it was for sound reasons, Mr. Littman. Any schedule of this kind, any study of this kind, is bound to be in round figures, not refined right down to the last cent.

There are other things which I could have added to our working capital study of a small nature which I did not add because of the labor involved, and the fact that we had very little time in which to prepare it.

We could have refined this down to a finer figure which, however, for these purposes, I do not think would have been justified.

[fok 4579] Q. Wasn't the amount of distribution system expense set out as a separate item in your statement?

A. The statement from which I took these figures is a consolidated statement with inter-company items eliminated.

Q. But wasn't there a separate item shown of distribution system expense?

A. No, that is all in operating expense.

Q. Well, if the amount had been larger, you would have [exluded] it?

A. If there had been any considerable amount capable of distorting the answer, I certainly should have taken it out.

Q. Don't you have access to the records that were used to make up the consolidated statement?

A. Yes, we could go back to the original books and break them down, but it would have been a matter of great labor.

Q. Couldn't you have gone back to the original statement from which the consolidated statement was made?

A. Sure, we could have, if we had had time.

Q. That would not have taken much time?

A. Yes, this is quite a job to do on short notice.

Q. Well, at any rate, it is your best estimate at present that $6,000 would be approximately the amount?

A. It would be less than $6,000.

Mr. Wheat: The witness testified it would be materially less than $6,000 which I have just taken down in [fol. 4580] notes from his testimony. Is that true, Mr. Sperry?

The Witness: That is right. It would be about 1/18th's of $48,000, I would say.

By Mr. Littman:

Q. You will agree that, as a matter of principle, distribution system expenses should not be included in working capital for purposes of this proceeding?

A. No, I would not admit that. I have no opinion on that.

Q. You mean to say that you would include amounts incurred in connection with the operation of distribution systems in your estimate of working capital, even if you knew that you could very quickly ascertain the amounts and deduct them for purposes of this rate proceeding?

A. I have no opinion on that, Mr. Littman. I have not studied that phase of it. Panhandle Eastern is not predominantly a distributing company. It is a wholesale company.

Q. It is not a distributing company at all, is it?

A. Not at the present time, no.

Q. Now, on what theory would you want to include any distribution system expense for purposes of this rate proceeding?

A. I am not prepared to answer that. I have not studied that phase of it.

[fol. 4581] Q. You do not know that much about working capital?

A. I do not know that much about rate regulation.

Q. Well, do you know enough about the subject of working capital to testify in this proceeding on the subject and submit an estimate on the subject for this Commission's consideration?

A. My effort has been here to accurately estimate the amount of dollars that is required by this company to have at all times to carry on its business, and I base my opinion only upon the experience that I have had sitting on the top of the till, watching the money go out.

I think that my figures adequately and accurately represent the amount of dollars which it has been necessary to pay out over a specified period, and I believe that we are justified in asking for a return on that number of dollars.

Q. You have in your last answer referred to proper amounts of working capital required for the purpose of carrying on the business.

A. That is right, operating the business.

Q. Now, what business is Panhandle Eastern going to be engaged in for the next three or four years, to the best of your knowledge?

A. I assume it is a continuation of our present business.

Q. Which does not include, in any part, the operation of distribution facilities, is that correct?

[fol. 4582] A. I think that is correct.

Q. Well, certainly you know enough about working capital, Mr. Sperry, to know that there should not be included in an allowance for working capital in the future, any sums that are related to the operation of distribution systems?

A. As I say, I have no opinion on that. I have not studied that, but I say this, that even if that inclusion is an improper one, as you intimate it is, it does not amount to over two or three thousand dollars in the aggregate.

Q. Is it or is it not a proper one?

A. I do not know, frankly.

* * * * * * * * *

[fol. 4585] Q. Who made the determination, Mr. Sperry, as to what items should be included and what items should be excluded from working capital?

A. I think I will have to take that responsibility.

Q. Well, you feel competent to do that, do you?

A. As I told you, I feel competent to estimate rather accurately how many dollars have gone through the till and for what purposes, and how many dollars it is necessary for us to have in the till to continue the operation of our business efficiently.

That is the only point to my study. I am not trying to interpret rate cases in any way. I am trying to determine how many dollars it is necessary for us to have and on which I think we are entitled to a return.

Q. For rate making purposes?

A. For the purpose of this study, yes.

Q. The thing I want to get clear, in view of counsel's statement, is whether you were making this study for rate making purposes or whether you were making it for some other purpose? Which one did you make it for?

A. I made it for purposes of this proceeding.

Q. For rate making purposes?

A. But understand, Mr. Littman, this is a mathematical compilation, nothing else. I am not trying to philosophize about rate making at all. I am simply trying to [fol. 4586] ascertain the number of dollars it is necessary for us to have in order to do business.

Q. It isn't just mathematical, is it, Mr. Sperry?

A. Pretty much, yes.

Q. There is pretty much judgment involved in inclusions and exclusions, is there not?

A. Very much so, yes.

Q. And how much should be allowed for this, that or the other item, is that correct? A. That is right.

Q. Well, suppose you knew that there was, let us say, half a million dollars of distributing system expense in your final estimated figure. Would you say that that amount should go out or should stay in?

A. I do not know, but I certainly should study it more carefully than I did when $2,000 or $3,000 was involved.

Q. You did not study it very carefully?

A. I did not study that principle, no. I left Central Distributing figures in because I thought they did not fundamentally distort the picture, and it was a matter of some labor and some difficulty to get them out.

Q. But, as a matter of principle, you are not prepared to testify whether those distributing expenses should stay in or go out?

A. That I will not pass on, no. I do not know.

[fol. 4587] Q. I believe you said that the amount of the distributing expenses would be approximately 1/18th of $48,000. Wouldn't it be more correct to say 1½/18th's of $48,000 in view of the 45-day period?

A. I would think so, yes—wait—we are talking about the aggregate of the moneys involved before the 45-day period applies. We are talking about the $5,000,000 total, aren't we?

Q. Yes.

A. In the $5,000,000-odd total, there may be a possible distortion here of $48,000. If you correct that to a 45-day period, then I should think it would be 1½/18th's.

Q. Rather than 1/18th?

A. Yes, I think that is correct.

Mr. Wheat: May I ask a question for clarification. You mean, do you, Mr. Sperry, that 1½/18th's of $48,000 would be the outer limit of the distortion you mentioned?

The Witness: Yes, in this $470,000 item concerning which we have been talking.

By Mr. Littman:

Q. I believe you mentioned something about not having sufficient time in which to make the elimination of the distribution system expenses.

If you had had sufficient time, would you have made the elimination?

[fol. 4588] A. Had we had sufficient time, we might have taken a different approach to this whole study. I do not know. We had a limited time, and I did the best I knew how in that period.

Q. Did you receive any instructions from anyone as to how to prepare this entire study?

A. I do not think I did, very much.

Q. Well, your answer indicates you received some little instruction. Who instructed you?

A. I think I had some guidance from our counsel as to how this thing had been approached in the past by

other companies, but the work on it is mine and I will have to stand or fall on it.

Q. By counsel, you mean Mr. Culton?

A. Mr. Culton.

Q. Did you and Mr. Culton discuss distribution expenses?

A. I do not think that was ever mentioned, no.

Mr. Culton: I told you, did I not, to determine how much money you, as Treasurer of this company, thought should be on hand at all times for general running expenses of the company?

The Witness: That is right.

Mr. Culton: And that is as far as my instructions went?

The Witness: That is right.

By Mr. Littman:

Q. Do you have a copy of Exhibit 49, which is Mr. [fol. 4589] Watkins' exhibit? A. No, I have not.

Q. Showing the income statement?

A. No, I haven't got it.

Trial Examiner: I will hand the witness my copy of Exhibit 49, if you wish.

The Witness: Thank you.

(Whereupon, a document was handed the witness.)

By Mr. Littman:

Q. Are you familiar with this exhibit, Mr. Sperry?

A. I think this is the first time I have seen it, probably.

Q. Now, I refer you to Line No. 9 on schedule 1 of Exhibit 49 which shows the operating and maintenance expenses and I refer you to Column J for the year 1940, which shows the operation and maintenance expense for that year to be $3,000,764.52. Do you find that figure?

A. Yes.

Q. Does that comport with your understanding as Treasurer of the company?

A. Does that what?

Q. Does that comport with your understanding of these figures? Does that figure look correct to you?

A. If it is Mr. Watkins' work, it certainly is correct, I think.

[fol. 4590] Q. Now, what was the average for the entire 8¾ year period shown in this exhibit as shown in Column L? A. The average?

Q. Yes.

Mr. Wheat: You mean, what does Mr. Watkins show in Column L on Exhibit 49 as the average, is that correct, Mr. Littman?

Mr. Littman: That is correct, and I think what I said is correct, too.

Mr. Wheat: Probably, but I wanted to make sure.

The Witness: You refer to the figure of $1,787,885?

Mr. Littman: Yes.

By Mr. Littman:

Q. You did not use the recorded operating expenses in arriving at the normal cash funds for working capital, did you?

A. No, I used cash figures completely.

Q. Which cash figures were taken from the cash book as you have heretofore testified? A. That is right.

Q. Now, the figure that you arrived at for the year 1940 is approximately $391,000 more than the recorded operation and maintenance expenses in that year, is that correct?

A. You are referring to what, my figure of $3,391,400?

Q. That is correct.

A. That figure is greater than the operation figure in Line 9 under Column J.

[fol. 4591] Mr. Wheat: Of Exhibit 49.

The Witness: Of Exhibit 49; but I call your attention to the fact that this figure of $3,391,400 includes some taxes which are not included in operation and maintenance expenditures on the income account.

It may include some other things too. They are not comparable, however.

By Mr. Littman:

Q. It includes construction items, too, does it not?

A. Yes. You cannot compare operating figures with cash figures, Mr. Littman, without elaborate reconciliation.

Q. I am not undertaking to make a direct comparison, Mr. Sperry. A. No.

Q. But it is a fact, is it not, that two items that would account at least in part for the difference between the cash book figures and the recorded figures are taxes and certain construction items, is that correct?

A. Certainly those, and maybe some others, I do not know. I have not analyzed this carefully yet.

Q. Will you state the amount of charges to plant account that are included in your allowance for working capital before the 45-day allocation?

A. I do not understand that question. Would you please read it to me?

. . . . . .

[fol. 4592] The Witness: For the year 1940, a total of $461,500. For the six months ending June 30, 1941, $483,100.

By Mr. Littman:

Q. That makes a total of $944,600 of charges to plant account that are included in your allowance for working capital, is that correct?

A. That includes the amount of dollars which we spent in that 18-months' period for regular construction of the nature of maintenance.

Q. Isn't it a fact that this amount of $944,600 represents charges to plant account and not maintenance?

A. I cannot answer that accurately at the moment. In our business, it is necessary for us to regularly spend money for the maintenance of our property in such a way as to classify it as regular construction, recurring construction of the nature of maintenance on which no interest is charged for construction, and those are the items to which I refer.

Q. Well, "of the nature of maintenance", to use your term would, of course, not mean maintenance, isn't that correct?

A. It is very similar to maintenance. It is construction that is needed in order for us to carry on our present business without any reference to expansion.

Q. Didn't you just testify a minute ago that none of [fol. 4593] this amount of $944,600 is included in Line 9.

of Exhibit 49, Schedule 1, called "Operation and Maintenance Expense"?

A. No, I did not say that. I do not know whether any of it is or not. I am not talking about the earnings records at all. I am talking from cash records, and my point here is that regularly our company has to use this kind of cash in these amounts in order to maintain our present property.

Q. You are not prepared to say whether any part of the $944,600 is charged to maintenance?

A. I really do not know, no. I do not think it is charged to maintenance. It is charged to regular construction.

Now, what it is charged on the earnings records, I do not know. I am not talking from the earnings record here at all.

Q. What are you talking from?

A. I am talking from cash records. I am trying to indicate fairly how much cash it has been necessary for us to have in the till right along for certain purposes.

Q. Perhaps this will clear up the matter, Mr. Sperry.

It is a fact, is it not, that the $944,600 that you mentioned represents capital charges to plant account, does it not?

A. It may, or they may be earnings items, I do not know. I am not the accounting officer of the corporation. I do not account for these things in the earnings records.

* * * * * * * *

[fol. 4596] By Mr. Littman:

Q. Mr. Sperry, at Page 456 of the transcript, your counsel asked the following question and you made the following answer:

"Q. Are the items included in your study or are any of them included or reflected in the plant accounts of the corporation?

"A. No. None of the items included in my study are reflected in the plant account."

* * * * * * * *

[fol. 4598] Q. In view of the answer that you gave to the question which I read, you undertook in your direct testimony to testify with respect to what is and what is not

included in the plant accounts of the corporation, did you not?

A. Yes. I stand on that testimony.

Q. With respect to what?

A. The items included in my study.

Q. Now, are you prepared to tell us how the $94[illegible],600 that you mentioned a moment ago is charged on the books of the company?

A. Again, I would like not to be questioned on how the accounts run. I am not an accounting officer. I know that we had expenditures of those amounts during those particular months for those purposes.

My testimony will go only to the amount of cash which we have had to pay out for certain purposes in the corporation.

Now, if you want to examine how those are subsequently accounted for, or how they are currently accounted for, you will have to ask the accounting officer.

Q. Regardless of how the items are charged on the books of the company?

A. My testimony goes only to a cash study.

Mr. Littman: If your Honor please, I think that at the time this witness made this study, he made it for the purpose of showing the amount of working capital to be added [fol. 4599] to Mr. Biddison's reproduction cost, and I do not think that the witness was particularly disturbed for that reason with what was or what was not charged to capital or expense, and he was not concerned with how these items were charged on the company's books.

However, in view of the fact that your Honor has excluded reproduction cost evidence in this proceeding, leaving in the evidence of book cost and original cost, it is of greatest importance for this record to show how these amounts are charged, whether they are charged to capital or whether they are charged to expense, and that, if your Honor please, is why I am so insistent upon having this witness enlighten us.

Now, if he does not know, of course we cannot secure the answer from this witness, but it seems to me that in the light of what has transpired on this record, counsel for

the company is under obligation to have the record show how these amounts were charged.

Mr. Wheat: Have you asked him directly, or do you want now to ask him directly, whether he knows or does not know?

Mr. Littman: I thought I had asked him that several times, but I shall try again.

Trial Examiner: The Trial Examiner put that question very definitely, and the witness has now declared that he stands upon his answer to the question quoted by Mr. Littman on Page 456.

[fol. 4600] The question to which the witness then responded was:

"Are the items included in your study, or any of them, included or reflected in the plant accounts of the corporation?"

Now, it would seem to the Trial Examiner that this witness might care to somewhat review that testimony with counsel and develop whether or not we have contradictory statements which appears to the Trial Examiner have developed in the record this morning.

[fol. 4601] By Mr. Littman:

Q. If I correctly understand your testimony, you do not know how the amount of $944,600 was charged on the books of the company, do you?

A. I don't know where it found its way ultimately.

Q. You can't give us any idea of approximately how much of the amount found its way into the plant account, and how much found its way into operating expenses?

A. I can't at the moment, no. I will say this: That at the time that that money went out of the till, at the time that money was expended it was no part of plant account nor did we receive any return on it as a part of plant account.

Mr. Wheat: You mean it was no part of the plant account.

The Witness: It was no part of the plant account.

By Mr. Littman:

Q. By the term "return" you mean you received no interest on these amounts?

A. I mean it could not have been part of our rate base; it was not part of our plant account.

Q. That is, at that time?

A. At that time.

Q. But may have become later?

A. It may have subsequently, surely.

Q. When you made the answer to which I called your [fol. 4602] attention a moment ago on page 456 of the transcript were you referring to all the items in working capital or—

A. (Interposing) Is that the answer "No, none of the items included in my study were reflected in the plant account."?

Q. Yes.

A. Yes, I believe the answer to your question is yes. I took pains to ascertain carefully that none of the items in my study were being used by Mr. Biddison in his study, either materials or supplies or construction expenditures. In other words, there is no overlapping between Mr. Biddison's figures and my figures.

Q. You were referring to Mr. Biddison's reproduction cost new less depreciation?

A. His appraisal of our plant account, yes, sir.

Q. You know, do you not, that Mr. Biddison included certain work orders in his reproduction cost, do you not?

A. No. I don't know his method of approach, but I do know that in the preparation of my work I went over carefully with the Accounting Department to make sure that none of the items which I was using in my study were being used in his. We reviewed that with some care.

Q. But you can not make that statement with respect to relating your working capital to book cost or original cost, can you?

The Witness: Will you read that please?

[fol. 4603] (Whereupon, the pending question was read by the reporter.)

By Mr. Littman:

Q. If you don't understand that question, perhaps I can clarify it.

Is your estimate of working capital referable to original cost or book cost?

A. It has nothing to do except with the cash figures of outgo.

Q. Well, of course, actual cost is actual cash, isn't it?

A. Yes, but any cash that went out of our company for plant upon which we thereupon obtained a return on our rate base is not included in my figures for working capital. In other words, our expansion expenditures, for instance, construction expenditures for expansion which are capitalized and on which interest is charged during construction are no part of my study.

Q. Do you know whether or not the company includes on its books work orders against which no interest during construction is charged?

. . . . . .

[fol. 4604] The Witness: I think it is. I am groping a little bit at it.

Is that another way of asking whether any of this construction of the nature of maintenance, which we have been discussing, is covered by work orders?

Mr. Littman: That is one part of it.

The Witness: That might be.

By Mr. Littman:

Q. But you don't know for sure?

A. I don't know offhand, no. I think it is probable.

Q. Well, let me get at it this way, Mr. Sperry: The company does capitalize amounts upon which no interest during construction is charged. Is that correct?

A. Yes.

Q. Now, can you tell by looking at the cash book, Mr. Sperry, upon what items interest is charged and upon what items interest is not charged?

A. I don't know whether the cash books would show that or not. I assume they would. Again, I would like to disclaim knowledge of the accounting of it. I would rather have Mr. Watkins answer those questions.

I know this: The items which I have included here in my working capital study have carried no interest during construction. We have had no return on them.

Q. How do you know that?

[fol. 4605] A. Well, I know it by definition. That is the way these items on my cash forecast were set up, the construction work of the nature of maintenance on which no interest is charged during construction.

Q. Why is not interest charged during construction on some of those?

A. I don't know. I suppose because it is of the nature of maintenance.

Q. Well now, someone in your company makes the decision with respect to what items shall carry interest charges and which ones shall not. Is that correct?

A. That would be the accounting officer, I would say.

Q. When is that decision made?

A. I don't know.

Q. Isn't that decision made not from the cash book but by the accounting officer from the work orders?

A. I assume it is made at the time construction budgets are approved. We divided our construction into two different kinds of construction, first, the construction which we have been talking about here this morning and, second, the expansion construction.

They take the form of separate budgets and they are separately accounted for on that cash forecast sheet, if you will notice. On the expansion construction we carried out, interest is charged.

[fol. 4606] On the regular maintenance construction which is necessary to support the present level of business, which has nothing to do with expansion, interest is not charged. That takes the form of the items we have discussed here, normal construction expenditures of a maintenance nature.

Q. Well, who made the determination for your purposes as between the items upon which interest is charged and the items upon which interest is not charged?

A. The Accounting Department which prepares that cash sheet.

Q. I call your attention, Mr. Sperry, to the $461,500 figure which you read into the record a moment ago as rep-

resenting the charges to plant account included in your working capital allowances for the year 1940 which are referred to in the annual cash forecast, which you used in preparing your estimate, as "Construction Regular".

A. That is right.

Q. How do you know that no interest is to be charged on that amount of $461,500?

A. That no interest will be charged on it or that no interest has been charged on it?

Q. Well, that no interest has and no interest will.

A. I am told by the Accounting Department that no interest is charged on that.

Q. And were you told by the Accounting Department [fol. 4607] that no interest will be charged on that amount?

A. If any of that item finally finds its way into the plant account when the books are closed, interest may then start to accrue. It may go into the regular plant account, but at the time these funds are spent no interest is being charged.

Q. Well, obviously, no interest is charged until the money is actually expended, isn't that correct, in any event?

A. That is right.

Q. So that when such part of this amount of $461,500 as will be capitalized on the books of the company does finally become capitalized and interest is then charged thereon for construction, you then have a duplication of that extent in your estimate, do you not?

Mr. Culton: You said "If that is done", did you not?

Mr. Littman: When it is done.

Mr. Culton: There is no testimony that it will be done. He testifies that it goes into plant account and, of course, if they are after interest—

The Witness: (Interposing) If that money should be allocated to plant account, then it becomes part of our rate base upon which we are entitled to earn a return, but until [fol. 4608] it goes there and while it is being spent here, the company is not obtaining any return on it unless it is included for rate-making purposes in the working capital allowance.

By Mr. Littman:

Q. Well, doesn't the amount go to plant account the moment it is spent? A. No, I don't think so.

Q. You are not sure about that?

A. No, as I say, I don't know the accounting of these items, I know that the money is being spent.

Q. Well, does the company expend any cash for interest during construction? A. No.

Q. Therefore, interest during construction never appears on the cash book which is the book that you studied?

A. Interest during construction is a book item, it is not a cash item.

Q. And, therefore, the interest during construction never appears on the cash book?

A. I would think that was correct.

Q. And the figures that you used for purposes of this study were the figures that were derived from the cash book. Is that correct?

A. That is right.

Q. So that you can not tell from the cash book or from [fol. 4609] figures derived from the cash book actually how much has been expended for interest during construction, can you?

A. We don't expend interest.

Q. Well, how much is charged for interest during construction?

A. If it is a bookkeeping item, purely and simply, it doesn't appear on the cash books anywhere.

Q. Well, will you explain briefly the company's policy with respect to interest during construction?

A. I can't do that, Mr. Littman.

Q. You can't tell us, for instance, the rate of interest that is charged? A. No.

Q. Or the period of time over which interest is charged?

A. No.

Q. Or the minimum size of the job upon which interest is charged? A. Those are accounting matters.

Q. Well, you do not, then, know of your own knowledge whether the sum of $944,600 of charges to plant account in the year 1940 and the first six months of 1941 are those upon which no interest during construction was charged?

A. Yes, I know that interest was not charged.

Q. You know that of your own knowledge?

A. I know it by definition on our books.

[fol. 4610] Q. I am asking if you know it of your own knowledge.

A. If you mean have I seen the accounting of it, no. The Accounting Department has represented to me that no interest is being charged on the items for construction which I have included in my working capital study.

Q. Well, assuming, Mr. Sperry, that the entire amount of $944,600 was charged to plant account on the books of the company, would you say that the entire amount is properly includible in an estimate of working capital for purposes of this proceeding?

A. Certainly. The fact remains that we have spent that money and haven't had a return on it.

Q. And the only reason why no return has been had on that amount under those circumstances is simply because the company, itself, elected not to charge any interest on that amount during construction. Is that right?

A. The reason it hasn't had any return is that it is not part of our rate base; unless it is included in working capital, it is not part of our plant account.

Q. Well, will you answer my question, specifically, Mr. Sperry?

* * * * * * * * *

The Witness: The company elected to account for it in this way rather than to immediately capitalize it? Is [fol. 4611] that what you mean?

By Mr. Littman:

Q. I am assuming that the amount is capitalized, Mr. Sperry, and I am asking you whether or not the company's failure to receive a return upon these capital amounts is due to its own election to not charge interest during construction.

A. It is due to its own chosen accounting methods, yes.

Q. And now what you are proposing to do is to change that accounting method? A. No, not at all.

Q. To change the election?

A. No, not at all.

Q. That is the effect, isn't it?

A. I simply propose to seek to include these sums in our working capital allowance as being recurrent monies that are spent month in and month out and on which we

do not get a return unless it is included in our working capital allowance.

Q. And the effect of doing what you propose will be the same as if the company had originally elected to charge interest on those amounts?

A. That may be so.

Q. Well, it is so, isn't it, Mr. Sperry?

A. I don't know whether there would be any practical difference or not. I don't see any at the moment.

[fol. 4612] Q. Mr. Sperry, assuming that this amount of $944,600 represents construction that was completed on the average of, let us say, three months, the company would have ordinarily, had it charged interest during construction on this amount, charged three months' interest on it, would it not?

A. You will notice that those amounts are expended over a period of 18 months almost regularly and recurrently, so that the average time would be nearer nine months rather than three months.

Q. How long are these amounts kept in the construction work-in-progress account?

A. Again, I don't know how or when those monies are accounted for.

Q. Well, assuming that it is three months, the actual interest charged by the company would cover a three-month period, would it not?

A. Had they been capitalized and interest been charged?

Q. Yes.

A. I would assume so. Again, that is an accounting matter.

Q. And under your method, you are capitalizing the entire amount and asking for a return, an annual return on the entire amount, are you not?

A. No, only for 45 days. We are asking for a return [fol. 4613] on 45 days.

Q. An annual return? A. Yes.

Q. For each year in the future?

A. In other words, we have averaged these amounts for 18 months and then asked for an allowance of 45 days' return.

Q. The amount of interest capitalized is determined as a matter of managerial judgment as to the proper amounts and methods, is it not?

A. I suppose so, yes.

Q. You are not familiar with those methods? A. No.

Q. You mentioned a moment ago that the period that you took for interest during construction and, as a matter of fact, for the entire cash amount was 45 days, did you not?

A. No. You asked me, I believe, if we were claiming this whole amount, the full 18 months period. I said "No", that we were asking for a return, not on the 18 months period, but on a 45-day period.

Q. Yes. Now, how did you determine that 45-day period?

A. It is arbitrary and a matter of judgment on my part.

Q. I am speaking now of the 45-day period for purposes of interest.

A. I am talking about the 45-day allowance for all working capital items.

[fol. 4614] Q. Yes. Now, let's talk about a 45-day period for this particular item, namely, the item of interest during construction. How does the 45 days stack up with the company's own experience in charging interest during construction?

A. I don't know.

Q. You don't know whether 45 days is right or not with respect to the company's own experience?

A. My theory on the 45 days is that all items of working capital for the 45-day period are equally applicable to all items which we have claimed for working capital and one of these items is the amount which we have spent for recurring construction in the nature of maintenance.

Q. Well now, you have already testified that you do not know the period of time over which interest is charged by this company. A. No.

Q. Is that correct?

A. That is on expansion projects, which we are not talking about here at all.

Q. Well, I am talking about the $944,600, Mr. Sperry.

A. That is right.

Q. And I am speaking about the 45 days which you applied. A. That is right.

Q. Now, you have testified, have you not, that you were [fol. 4615] not familiar with the company's policy with re-

spect to the period of time over which interest is charged by the company?

A. No, that is an accounting matter about which I can't testify.

Q. In other words, my statement is correct, that you are not familiar with that matter. Now, how can you say that the 45-day period that you used with regard to this particular item that we are now discussing is correct or not?

A. I don't say it is correct or not: I say that on all items of working capital, including this one, we have arbitrarily asked for a 45-day allowance.

Q. Well, it is just an arbitrary matter, is it?

A. That is a judgment factor.

Q. Judgment of what?

A. It seems to us that that is a reasonable and representative approximation of the lag period as applied to working capital expenditures and we believe consistent with the practice before Power Commissions.

Mr. Goodman: You mean by the "lag period" the period between the provision of the money and reimbursement?

The Witness: Yes, the initiation of service to the customer and our repayment therefor.

Mr. Goodman: By that do you mean the period between the monetary provision and the reimbursement? Is that what you mean?

[fol. 4616] The Witness: That is right.

By Mr. Littman:

Q. What does the lag period have to do with the period of time over which interest during construction is charged?

A. I don't believe that I represented that it did have anything to do with it. I said this: That there are certain items of working capital, of cash for these various purposes which we would like to have as an allowance. Those items aggregate over a period of 18 months almost five odd million dollars of money that goes out of the till for these particular purposes.

Now, in asking for a working capital allowance, we have to assume a lag period. We have assumed 45 days as an allowance, as a reasonable and representative allowance.

Q. Does that have anything to do with the company's experience? I am now referring to the 45 days.

A. Yes, it is predicated on the company's experience.

Q. Do you expect to get your construction expenditures back in 45 days?

A. Mr. Littman, I don't believe that that is the point.

Q. Well, the point is that the 45 days doesn't have anything to do with the period of time over which interest is actually charged by the company. Isn't that correct?

A. We pay out regularly and monthly certain amounts of money for various purposes, cash, which, as we have [fol. 4617] developed this morning, aggregate five million odd dollars over a period of 18 months. Now, in that one of those items is regular recurrent construction expenditure in the nature of maintenance. In my opinion that is a perfectly sound basis for including that in your working capital requirement.

* * * * * * * * *

Q. Do you know whether these items replace other items of construction?

A. No.

Q. In many instances they do, do they not?

A. I don't know.

* * * * * * * * *

[fol. 4618] By Mr. Littman:

Q. To the extent that it does replace other items of construction, then to that extent the replaced items are in the rate base, are they not, already?

A. Yes, I would think so.

Q. And return has been earned by the company and is presently being earned by the company on those items, is that correct?

A. That might be. I would think that that is so. Without having more time to think through your question I think that is right.

Q. Now, I believe you stated here recently that these expenses in the nature of maintenance or charges in the nature of maintenance are constantly recurring.

A. Yes.

Q. What do you mean by that? They are rather static?

A. No, I mean that they have these expenditures. These expenditures occur to a varying degree each and every month. There is no month in which they do not occur.

Q. The fact of the matter is that they are not static, isn't that correct?

A. Yes, they fluctuate.

Q. And construction fluctuates considerably from year to year, doesn't it?

[fol. 4619] A. Well, this type of construction has been fairly consistent, I think, over a period of years.

Q. It wasn't very consistent in the last 18-month period, was it?

A. Well, let's see. It was considerably more per month in 1941 than it was in 1940. It averaged in 1940 about $40,000 a month. This year it has averaged about $80,000 a month.

Mr. Wheat: Pardon me, you mean the first six months.

By Mr. Littman:

Q. That is a fluctuation of 100 per cent, isn't it?

A. Yes. That is quite a fluctuation.

Q. I would say it is too.

A. There was one month, May, in which we expended $118,000 for this type of construction. I can't tell you why at the moment.

Q. Then your allowance, which is based partly upon construction expenditures for this 18-month period, can hardly be called a normal or equalized cash requirement, can it?

A. No, I would say that this indicated clearly that our expenditures are increasing all the while for this type of construction and that the average for the first six months this year was probably more representative of what it is going to be. The item shows a tendency to increase here.

Q. You mean in the last six months?

[fol. 4620] A. Yes, the last six months here in 1941 have required a materially larger amount of money than they did in 1940.

Q. Have you checked to ascertain what the situation was for the last six months of 1941?

A. No, my cutoff date is June 30. The estimate which we prepared on July 8 indicated it would be substantially more the last six months of 1941 than it was the first six

months. I don't know whether that has been borne out by experience, but that was the estimate.

Q. The company wasn't able to get a good deal of pipe that was on order, isn't that correct?

A. If that was pipe, that would probably be construction expenditure for expansion purposes and wouldn't be included in this category.

I haven't the December figures, but our estimate through November would make it appear that we had spent in the last six months more than we spent in the first six months, but about $200,000 less than we expected to spend. In other words, our total of this category for the 12 months ending December 31, 1941 shows this item to be $961,000 with one month estimated as against $1,100,000 with six months estimated.

Mr. Culton: Do you have the actual figures through November?

The Witness: I have the actual figures through November and they would indicate that the acceleration in [fol. 4621] that item has continued.

By Mr. Littman:

Q. Will you please refer to Exhibit 52, which is the exhibit prepared by Mr. Watkins showing the gas plant? Will you please refer to page 2 of that exhibit? On line 38 of page 2 is shown the total gas plant classified amounts for each of the years 1930 through June 30, 1941.

A. That is item 42, you say?

Q. No, line 38.

A. Pump station equipment.

Q. On page 2.

A. Yes.

Q. Now, in 1940 these figures show that there was approximately $5,000,000 more construction than in 1939. Is that right?

A. It shows that the overall gas plant had increased by that amount a little over $5,000,000 during that period.

Q. In the preceding period there was a slight increase?

A. Yes.

Q. And there is a slight increase in the previous period, 1937-1938?

A. Yes.

Q. Then, there was considerable construction between 1936 and 1937, is that correct?

A. Yes.

[fol. 4622] Q. In other words, it shows a considerable fluctuation through the years, does it not?

A. It shows we added a lot of property in 1937 and a lot more in 1940, but in the intervening years not so much.

Q. Do you have Exhibit 49 before you?

A. Is that Exhibit 49 and the same line?

Q. I am referring to line 9 of Schedule 1 of this Exhibit, headed "Operation and Maintenance Expenses". Isn't it a fact that the average operation and maintenance expenses for the years 1932 to 1940 are considerably less than the 18-month period that you have used?

A. Sure, they are bound to be. We were doing very much less business in those earlier years. Furthermore, that trend upward is continuing now at a very fast rate. Our operation expenditures increase every year and will increase at a faster rate from now on.

Q. And why did you select the last 18 months as the test period?

A. That came about in this way: In trying to find a formula to develop these figures, trying to find a simple way of presenting them, I took the first full year's figures which I had at my disposal, which was the calendar year 1940.

Having compiled those figures, I then brought them down to the nearest date which I could, which was June 30 at that time, 1941, and I noticed that the 1941 figures were [fol. 4623] very much higher than the 1940 figures. On the other hand, in the interest of conservatism, I used the whole 18 months instead of the last six. We could have improved our case materially by using the last six, but I felt that it was proper for me to use the longer period.

Q. Now, referring to your 45-day period, which you have already described as a lag period, did you make a study to determine the actual elapsed time between the payment of operating expenses and the receipt of revenues?

A. No, sir, I did not. That would have involved a good many weeks' work which we didn't have at our disposal.

Q. It would have been desirable to do that, would it not?

A. If we had had lots of time that could have been done; we didn't have. Furthermore, the precedents for this particular period seems to be very adequate. Regulatory commissions have accepted it in a great many cases and it rather squared with my own judgment from experience on this lag, and so I used it arbitrarily. It is a judgment factor and I can defend it only on the basis of judgment.

Q. That judgment was not based upon a study of the company's actual experience, was it?

A. No, I talked with our accountants about that and I found that they had in one other case made an elaborate study of lag. I went over their approach to it. It was a [fol. 4624] scientific approach but a very involved one. It would have taken weeks to work out and we just didn't have that time. Furthermore, it, in my opinion, would not have altered the answer very much.

Q. How do you know?

A. I should have liked to have asked for an amount sufficient at all times to cover sixty days but, in my opinion, 45 days is a safe minimum and a conservative period for which to ask.

Q. That is based on court decisions and commission decisions that you have read?

A. It is based primarily on my own judgment as to how much cash you ought to have and it is consistent with opinions in other representative cases.

Now, in the case of the Natural Gas Pipe Line Company they approached it more scientifically. Their company is very similar in some respects to ours. They claim 49-odd days, I think. We are claiming a little less than that.

Hope Natural claimed 45 days.

There have been others.

Q. Well, let's test your 45-day period, Mr. Sperry, with the actual experience of the company. What is the largest item of cash operating expense of your company?

A. Wages, I would say.

Q. What would you say of gas purchased expense?

[fol. 4625] A. I don't think that is as large as wages, but it may be.

Q. Well, I think you will find that that is the largest.

A. It may be.

Q. At any rate, it is one of the largest?

A. That is right, it is one of the largest.

Q. Will you read into the record the amounts paid by Panhandle Eastern in 1940 for gas purchased?

A. Instead of gas purchased, let's call it "Gas Expense", because that is the item that I have here and I am not sure that they are synonymous. There may be some produced production expense, gas expense.

Q. We understand that is the amount paid by Panhandle Eastern to its gas vendors for gas purchased.

A. Yes.

Q. Very well.

A. In round figures, $1,187,000.

Q. $1,187,000?

A. Yes.

Q. And what was the amount for the first six months of 1941?

A. $676,000.00.

Q. And that is a total of $1,863,000, is it not?

A. Yes.

Q. That is included for the 18-month period in the [fol. 4626] amount of $5,609,600, which you referred to a while back?

A. Yes.

Q. Now, on what day of the month are gas purchases paid for by Panhandle Eastern Pipe Line Company?

A. We usually pay for our gas on the 20th of the month.

Q. Now, on what day of the month are gas revenues received?

A. That varies but a majority percentage is usually paid from the 23rd to the 26th of the month following its sale. In other words, if we start delivering gas to Detroit on the first day of January, we usually get paid for it on the 25th or 26th day of February. Now, there are exceptions to that, but in general that is the predominant part.

Q. Now, when is payment made for the gas purchases?

A. They are payable on the 20th of the month following the take-out.

Q. In other words, the payments for gas purchased and the receipts for gas sold are on a comparable basis, are they?

A. No, not quite.

Q. Well, except the one that is on the 20th and the other is around the 25th.

A. No, not exactly that either.

Q. What is the situation?

A. We purchase substantially all our gas on a fiscal [fol. 4627] month basis with a cut-off on the 22nd of the month. We pay for it less than 30 days later, the 20th of the following month.

In the case of gas deliveries we start delivering on the first of a month and we collect about 55 days later, so there is a difference in lag there, you see.

Q. Let's see if I understand your testimony correctly. The revenue derived by Panhandle Eastern from gas sold by it is received not later than the 26th of the month?

A. Approximately, of the following month.

Q. Following the month of delivery?

A. Following the month of delivery, yes.

Q. And am I correct in understanding your testimony to be that the payment for gas purchased by Panhandle Eastern is made on the 20th day of each month following the date of delivery?

A. Yes. Not following the date of delivery, it is following the date of billing. They usually read our meters for gas delivered around the 22nd or 23rd of the month. We pay for it the 20th of the following month. We have had that gas.

Well, in these circumstances which you have described there really isn't any lag at all in it?

A. Yes, there is some lag.

Q. That is, lag between the purchases and the payments. You say there is some lag?

[fol. 4628] A. Oh, yes, there is some lag. It is pretty hard to determine just exactly what it is, Mr. Littman.

Q. Well, the lag is in favor of the company, isn't it?

A. Oh, no.

Q. Why isn't it?

A. Well, let's start with the 22nd of the month when they read our meter and charge us for some gas. We pay for that gas the 20th of the following month. We start service to our customer on the first of the month, we get paid 55 days afterwards or thereabouts or the 26th of the following month. During that time it is necessary to carry some of that gas, I mean carry the customer for some of that gas. There is some lag. It is pretty hard to tell just exactly what it is, but there is some lag there.

Q. How much of a lag is there?

A. I don't know. I am frank to say I have spent sometime trying to determine what the lag is, but it is one of those things that would have to be worked out by a good deal of work on the part of our accountants.

Q. There wouldn't be any such lag as 45 days, would there?

A. No, I wouldn't think so.

Q. Can you give us a general idea of what the lag would be?

A. I am frank to say that this question of lag and [fol. 4629] trying to prove statistically how many days' lag there is in this working capital defies me, I can't tell you.

Q. The lag would be considerably less than 45 days, wouldn't it?

A. The lag is something and it is less than 45 days in the case of purchased gas.

Q. And it is less than 15 days.

A. Then you have got the question of produced gas and there is a different lag altogether there when we pay for that. It is just one of those things, one of those questions which to me, at least, — and maybe it is because I am a poor mathematician, just defies statistical analysis. I just can't tell you.

Q. You have a good idea it is less than 45 days?

A. I have testified it is less than 45 days in the case of purchased gas, yes; there is no doubt about that.

Q. And in the case of purchased gas it is less than 10 days, isn't it?

A. No, I wouldn't say that.

Q. What is your best judgment?

A. I can't give you a judgment. I can't reduce that thing to mathematics. If I could I would. I am not trying

to evade it. I simply say it is one of those things that defies careful analysis on my part. I have spent a lot of time on that in trying to arrive at a satisfactory answer. [fol. 4630] I know this, and I will testify sincerely to this, that the allowance that I have asked for for overall working capital purposes is not excessive in the light of our experience. If we start doing business on the first day of the month and operate for 45 days with $470,000 here for working capital for operating expenses, I am certain that sometime between the first and the 45th day we would be out of cash, see?

Q. Well, you can't tell us why you are certain?

A. To that extent it would have to be a judgment factor. I just can't do it statistically.

* * * * * * * *

[fol. 4631] Louis F. Sperry a witness, having been previously sworn, resumed the stand and testified further as follows:

Cross-Examination (Continued)

By Mr. Littman:

Q. Mr. Sperry, at the close of this morning's session, we were discussing the matter of the date of payment by Panhandle Eastern for gas purchased and the date of receipt by Panhandle Eastern of gas revenues.

I would like to make certain that I understand your testimony on this subject thus far. Is my understanding correct that the gas vendors are paid on the 22nd day of the month?

A. Twentieth of the month.

Q. And their meters are read on what date?

A. Twenty-second or 23rd of the preceding month.

Q. Now, the gas revenues are received on what day of the month?

A. The majority percentage is paid for between the 23rd and the 26th of the month following delivery. There are other sales with payments on other days, but the pre-

ponderant amount comes within the four days I have men-
[fol. 4632] tioned, within the 23rd and the 26th.

Q. Now, the largest single customer of Panhandle Eastern is the Michigan Consolidated, is it not?

A. That is right.

Q. Michigan Consolidated Gas Company?

A. That is right.

Q. Which serves the City of Detroit?

A. Yes.

Q. Will you give us the 1940 revenues received from that company?

A. Approximately $5,700,000.

Q. That is for the year 1940?

A. Yes.

Q. On what date does Panhandle Eastern receive the revenues from Michigan Consolidated Gas Company?

A. Usually about the 25th of the month.

Q. As a matter of fact, doesn't Michigan Consolidated pay first to Michigan Gas Transmission Company?

A. They deposit in a special account for us in Detroit through the courtesy of Michigan Gas Transmission, yes. We delegate Michigan Gas to collect that account for us, and it is deposited in a special account for us in a Detroit bank.

Q. When is it actually paid by Michigan Consolidated?

A. It becomes good funds in Detroit usually on the 24th or 25th of the montth. It becomes usable to us in
[fol. 4633] New York or Kansas City a day or two later than that, but you might say, for the purpose of this argument, the 25th is a fair day to state.

Q. Now, in the light of your testimony thus far, I would like to go through two or three typical months for the purpose of ascertaining how these revenues are received and gas expense paid.

Would it be correct to say that you start receiving gas from vendors on the 22nd of the month?

A. We can start any day you want in the month.

Q. Let's start on January 22, for instance.

A. All right.

Q. And the meters of the gas vendors are read on February 22nd and February 23rd, a month later, is that right?

A. Yes.

Q. Now, the gas that has been purchased by Panhandle Eastern from its vendors and received from its vendors during the period January 22 to February 22 is paid for on March 26, is it not?

A. That is right.

Q. So that, all in all, there is a period of approximately 60 days between the date of first delivery and the date of payment, is that correct?

A. That is right.

Q. Now, with respect to gas revenues, the deliveries [fol. 4634] start on, let us say, January 1. Would that be correct?

A. No, you have to start on January 22, the same day that you started your gas sales. You start the same day that you started your gas purchase.

Q. Well, with respect to the gas that you sell during the month of January, during the calendar month—withdraw that—isn't it a fact that the gas revenues are paid by calendar months?

A. Yes.

Q. Now, taking the calendar month of January 1 to January 31, the revenues received from the gas sold in that month are received on February 23 to February 26?

A. That is right, but that is December gas.

Q. Which get paid on February 23 to 26. You are being paid for gas that you delivered in January, are you not?

A. Yes, 22 days before the date you assumed we started delivery.

Q. On the 23rd of February to the 26th of February; you receive the revenues for all the gas that you deliver in the calendar month of January?

A. That is right, which gas we took from the vendors in December, starting the cut-off date with December 22nd.

Q. Don't you deliver the January gas in January?

A. Sure.

Q. In other words, the gas that you deliver up in [fol. 4635] Detroit, for instance, during the month of January, was purchased from the vendors in the month of January, was it not?

A. Yes; it was purchased from them in January, but the meter was not read until January 22nd.

Q. That is right.

A. That is right, but we still have got to pay them for their December bill before we get any money for the January gas.

Now, if you are trying to establish lag here and that is what you are doing, apparently, you have got to start with the same cut-off date, both on gas purchased and on gas sold.

It is not fair to take the 22nd day of the month cut-off for gas purchased and January 1 for gas sold.

Q. Now that we have established the actual dates of payment to vendors and the actual dates of receipt of revenues, will you tell us how much lag there is based on those dates?

A. I told you this morning I cannot figure it. There is lag, but I cannot tell you how much, and I do not believe you can figure how much because of the difference in cut-off dates, you see.

Q. Didn't you mention a 55-day lag this morning?

A. Yes, between the beginning of service and the receipt of the check, from the beginning of service on the first of any month to the receipt of the check.

Q. That is a 55-day lag with respect to revenue, is it [fol. 4636] not?

A. It is a maximum of 55 days lag on one day's business.

Q. And you have already testified that the lag with respect to gas purchased is 60 days, is that right?

A. No. You quoted a specific example where there would be a 60-day or approximately a 56-day lag on a particular purchase of gas.

I do not think you can generalize on either one of those statements.

Q. Let me put it this way. 60 days elapsed between the day when you first buy gas and the day that you pay for it?

A. Sometimes, only when that day happens to be the 22nd day of the month.

Q. Well, that is a maximum, isn't it? It couldn't be more than 60 days?

A. No, that is right.

Q. That would be a maximum lag with respect to gas purchased, would it not?

A. Yes.

Q. The 60 days?

A. Yes.

Q. And the maximum lag that you could possibly have with respect to gas revenues is 55 days?

A. If you collected your bill on time, that is correct.

Q. And you do collect your bills on time?

[fol. 4637] A. Not always, sometimes we don't.

Mr. Lee: You do from Detroit?

The Witness: Yes, Detroit usually pays on time.

Mr. Lee: You are talking about Detroit?

The Witness: No, we are talking generally.

Mr. Lee: Usually it does. You do not know of any instance where it did not, do you?

The Witness: I think once or twice there have been a mutual arrangement to delay payment. It may be due to measurement difficulties. It has no reflection on Detroit credit. They pay promptly.

Mr. Lee: What I am getting at is, there is no lag so far as the Detroit payment to your company is concerned.

The Witness: Usually there is not. You mean there is no lag between the day it is due and the day we get it?

Mr. Lee: Correct.

The Witness: No, it is very seldom late, and sometimes it might be early, by mutual agreement. I have seen times when we asked for their check a day or two ahead of time because we needed the money.

By Mr. Littman:

Q. And they complied with your request?

A. I suppose they have, yes.

Q. This date of the 23rd to the 26th of the month, these dates are the ones on which you receive substantially all [fol. 4638] of your revenues, is that correct?

A. The 23rd to the 26th?

Q. Yes.

A. Yes, that is when the preponderant amount of our payments come in.

Q. Certainly by the 26th of the month, you receive more than enough money with which to pay all of your operating expenses, isn't that correct?

A. For what period?

Q. Well, for the month.

A. For what month?

Q. For any month, for the month in which the revenues are received.

A. Sometimes your expenses overlap. Sometimes they are not all for that particular month. Understand, Mr. Littman, our 45-day period applies not alone to gas purchased, gas sales, but applies to other operating expenses, ordinary construction, taxes and other matters, and in order to get a fair estimate of average lag or average elapsed time during which the company has got to have something in its till to pay bills, you have got to analyze everyone of those things in detail scientifically.

Q. You did not do that?

A. No. I testified this morning that was a job for public accountants that would take weeks to do. However, I [fol. 4639] am just as much interested in this subject as you are, but I repeat it was impractical to do it.

It was difficult to do it and, in my opinion, it was unnecessary to do it, because our experience indicates that we have got to have so much cash in the till in order to pay our bills and, in spite of all of the planning you can do ahead of time, you have got to have working capital. You have got to have cash with which to pay bills.

Q. Well, of course, one way of getting that cash is to get your revenues before you make any payments for operating expense.

A. That would be grand.

Q. What would be grand?

A. That would be fine, if everybody would pay us in advance for gas, but they do not.

Q. That is what we are here trying to ascertain; whether or not you, as a matter of practice, do receive your revenues before the time that it is required that you pay your operating expenses.

A. Yes.

Q. Now, that is what I would like to know, and going back to our original train of thought, you have testified that a 60-day period is the maximum lag for gas expense.

A. Maximum possible, yes, if we pay our bills on time.

Q. And you do pay your bills on time?

[fol. 4640] A. And we do pay our bills on time.

Q. What is the maximum lag with respect to gas revenues? A. That we cannot control.

Q. Isn't it 55 days?

A. In most cases, our credits are good. The people who do business with us are responsible and, in most cases, they pay on time. In some cases they do not, and we are helpless.

Q. Those cases are minor?

A. They are not any considerable portion of our revenues.

Q. Now, excluding from present consideration for the moment those minor exceptions to which you have just alluded, the maximum lag period on the revenues is 55 days, is it not? A. Usually, yes, sir, in most cases.

Q. So that, taking the two maximum lag periods, the gas revenues are received five days before your gas expense?

A. No, not at all. That does not follow. One day's consumption of gas, the purchase of gas on our part, could take place five days after one day's revenue from the sale of gas.

Q. Is there anything to prevent your company from—

Mr. Lee: (Interposing) Mr. Littman, pardon me, but that condition would be taken care of because it would fall in the following maximum period, would it not?

The Witness: In other words, in the meantime we have [fol. 4641] got to pay for some more gas. If we collect from Detroit on the 25th for any gas that has been sold them, we have still got a bill coming in to pay for a month's gas before we get another check from Detroit.

If we get $1,000,000 from Detroit today—

Mr. Lee: (Interposing) Not if you synchronize your maximum day for payment to the vendor with your maximum day for collection of revenue.

The Witness: Mr. Lee, that is why we have to have working capital, because you cannot synchronize the payment to the vendor and your collections. You have just got to have money to tide yourself over because your collections do not come on the same day that your expenditures do.

Mr. Lee: At the most though, under your statement, the condition could only exist from the initial month's take and selling?

The Witness: No, that is not so, Mr. Lee, because remember we are talking here, or have been talking today, only about one item of expense.

Mr. Lee: I am only talking about that.

The Witness: Namely, purchase of gas.

Now, we produce half our gas and the expenses of producing gas are constant, day by day, week by week, month by month. The lag period there is entirely different. All that Mr. Littman is exploring today is half our gas re- [fol. 4642] quirements and only that which is covered by purchase contracts.

Mr. Lee: But if, for the moment—and I don't want to break in on Mr. Littman, but while this is fresh in our minds I would like to get this point cleared up—let us confine ourselves to the Detroit market alone, which is 40 percent of your entire market, as I understand.

Isn't it an actual fact that, so far as gas purchased is concerned, take your own illustration, that you have the money for that from the local distribution company before you are called upon to pay for it?

The Witness: No, that is not so. I will tell you why.

No matter what date you take, we have got to pay for that gas or some gas before we get paid for some other.

Mr. Lee: Only after the first month. Only from the first month in the beginning.

The Witness: If it is possible to assume, which it isn't, if it is possible to assume that this company starts operating today, fresh and new, with all of the volume of business we have got on our books—

Mr. Lee: (Interposing) No, I mean a situation analogous to this, where I go to work for you for $20 a week and you hold back my first week's wages, which is the custom in business practice, and you always owe me that money, but thereafter, I am always caught up and you are caught up with paying me.

It isn't a continuous performance, is it?

[fol 4643] The Witness: No, but this is what you are getting at, Mr. Lee. This is January 5th, today. I do not care what the relative dates are. The fact remains I have got to pay for a month's gas this month before I get any receipts from Detroit, and I have got to have the money in the till to do it. Do you see?

Mr. Lee: No, I do not.

The Witness: On the 20th day of this month, I have a bill coming in.

Mr. Lee: By the time you get that check through there and it clears back to your bank, you will have received a deposit in the Detroit bank on the 22nd.

The Witness: No, we do not kite checks. The fact remains I have got to pay for gas on the 20th, and I do not get the money from Detroit until the 25th.

Mr. Lee: You could get it on the 22nd. You could make a draft on the bank if you wanted to.

The Witness: No, I have the dates here for all last year on which I received those payments, and they average around the 24th or the 25th, and the funds are not good for use until the day following. That is Detroit money.

Mr. Lee: Why is there two days intervening when it is paid—

The Witness: (Interposing) It is the mechanics of collection.

[fol. 4644] Mr. Lee: (Continuing) On the 22nd, it is there to your credit.

The Witness: I do not believe it is paid on the 22nd. It may be mailed on the 22nd.

Mr. Lee: I am assuming it is put right in the bank by the Detroit company.

The Witness: My records show we do not get it until the 24th or 25th, and then it is in Detroit. What that particular mechanics is that accounts for that one or two days, I do not know, but no matter how you stymie these dates around, your have got to have working capital in your till in order to pay your bills, and that is just a question of finding out what the first amount of that working capital is.

By Mr. Littman:

Q. How many days do you have to take—

A. (Interposing) I have asked for an average of 45 days.

Q. You have asked for that? A. Yes.

Q. But how much do you actually have to have, based upon the experience of this company?

A. Based upon the experience, my five years sitting on this till, I would object strenuously to starting today with less working capital than we have asked for as an allowance in order to get through the next 45-day period, week [fol. 4645] in, week out; month in, month out; year in and year out.

Q. That his your ultimate conclusion?

A. That is my conclusion.

Mr. Lee: That is the only factor you can give?

The Witness: I think I have supported this with my figures. I think I have shown you where I have got to have $500,000 for operating expenses, another "X"-hundred thousand dollars for material and supplies, and another "X"-thousand dollars for pre-payments.

I have compiled these figures honestly and conservatively. I have not tried to put the best foot forward. I have tried to make it realistic.

I have taken an 18-months' period instead of a 6-months' period and I think it is a fair presentation.

By Mr. Littman:

Q. Is this 45-day period specifically required for the purpose of gas purchase expense?

A. Mr. Littman, the 45-day period which we request is a judgment factor which spreads not only to gas purchase. That is only one item, but it passes to wages, taxes, prepayments, materials and supplies and everything else.

Q. Let's look at this one item for the moment and confine ourselves to this one item. Will you answer my question, namely, is the 45-day period necessary for the purpose of gas purchase expense?

[fol. 4646] A. No. I testified this morning that the lag between gas purchase and gas sale was not 45 days and you asked me how much it was, and I told you it defied analysis. I cannot tell you.

I know it is not 45 days, but I know the aggregate amount of these cash payments which we have outlined here does aggregate around 45 days and I know it would not be safe for me to sit here on just that amount of money and be able to pay all my bills in the next 45 days without sometime or other running out of cash.

Q. Confining ourselves to gas purchase and gas revenues, according to your testimony, you state that you allow your customers a shorter credit period than is allowed to you by your vendors. Is that correct?

A. No, I do not recollect that.

Q. Isn't that your testimony?

A. What is that again?

Q. Don't you say you allow your customers a shorter credit than is allowed by you to your vendors?

Mr. Culton: When did he testify to that, Mr. Littman?

The Witness: I do not remember that.

Mr. Littman: The billing dates showed that.

Mr. Culton: You asked if he testified that.

Mr. Littman: Well, let him state if that is correct.

The Witness: We agree to pay our vendors on the 20th [fol. 4647] of the month for gas taken out up to the 22nd of the previous month.

Most of our sales contracts provide that our customers will pay us approximately 45 days after we begin the service to them.

By Mr. Littman:

Q. Now, which of those periods is the shorter, the revenues period or the expense period?

A. I would say the expense period was shorter—yes, certainly.

Q. How do you figure that?

A. Are you including in your question other items than just the gas purchased?

Q. No; I am just talking about gas purchased.

A. You are not talking about gas produced?

Q. I am talking about gas purchased, which is the amount you read to me in this morning's session, amounting to $1,187,200 for the year 1940, and $676,400 for the first six months of 1941. A. Yes.

Q. That is the figure I am referring to.

A. I misunderstood slightly. The period between the cut-off at the well, the day the meter is read to the time we pay for it is approximately 28 days.

Q. Which period—

[fol. 4648] A. (Interposing) That is the period we have to pay in. The period we collect from our customers is the period between the first of the month and the 25th of the next month, which is approximately 55 days.

. . . . . .

[fol. 4649] Q. Well, suppose the period of receipt of revenues and payment for gas purchased were synonymous. Would you require any working capital on that account? A. Well, they are not.

Q. Let's suppose they were. Would you require any working capital on that account?

A. Yes, we would have to have working capital anyway.

Q. In other words, let's see if you correctly understand my proposition.

Suppose you collected the revenues for the gas sold during the preceding month and suppose you paid for gas purchased in the preceding month at the same time.

What, if any, amounts would you require for working capital in those circumstances?

A. We would require working capital for wages, taxes—

Q. (Interposing) I am talking about the amount re-
[fol. 4650] quired, if any, on account of gas purchase expense.

A. Well, Mr. Littman, I hardly know how to answer that question.

In the first place, it would be impossible for that to happen. We have got to have gas in our line before we can sell it. We have got to buy gas before ~~we can sell it~~ or produce it.

Q. You have a separate provision in here for line pack. Excluding from consideration the item of line pack, which is a separate item anyhow, my question is, suppose all of the gas that you sell during the month of January, we will say, is paid for on the 20th of February and your revenue derived from the sale of that particular gas is received on the 20th of February.

I am asking you what amount would be required, if any, for working capital in those circumstances.

A. And assuming that both bills are paid promptly in every case, is that right?

Q. Yes.

A. In other words, there is no credit risk, one way or another?

Q. And assuming that the amount of revenues is more than ample—

A. (Interposing) In that case, if that were possible physically and assuming there were no credit risks, in so-
[fol. 4651] far as it only pertains to the gas purchased itself, no other expense, there would be no requirement for working capital.

Q. All right. What is there to prevent your company from operating its business in just that way?

A. It is perfectly impractical to operate business in that way.

Q. Why?

A. In exactly the same way it would be impossible for you to get paid in advance for everything you do.

Q. You are not paying for gas in advance, are you?

A. No.

Q. You are paying for gas as long as 60 days after you receive it, are you not?

A. In some cases.

Q. That is the longest period. The shorter period is 30 days. There is at least 30 days—

A. (Interposing) 28 days. We pay for our gas somewhere between 28 and 58 days after we get it.

Q. And you receive your revenue—

A. (Interposing) You cannot tell me, nor can I tell you, how much we pay for between those periods. You cannot measure it, but somewhere between those periods, we pay for it.

Q. So you are not paying for gas in advance, are you?

A. We are going back to the same question, which I conceded sometime ago, namely, there is not a 45-day lag [fol. 4652] between the payment for gas and the receipt from the customer.

Q. It is considerably less than 45 days?

A. It is something less than 45 days. I do not know how much, and neither do you.

Q. Well, I will tell you, so far as we are concerned, there is a lag in favor of the company, but that is our opinion.

A. That is right.

* * * * * * * * * * *

By Mr. Littman:

Q. Is it your testimony that you cannot calculate a lag for purchases and sales where the sales do not precisely coincide?

A. I have testified that I have not been able to satisfactorily estimate the lag that takes place in our particular business to the extent of determining mathematically accurately, exactly how many days that lag is.

Q. Nor anywhere near accurately?

[fol. 4653] A. I cannot do it. Now, maybe somebody else can, but I cannot do it. I do know that I need approximately 45 days' money to run the business.

Q. Well, you feel that way about it?

A. Yes, sir, that is my judgment.

Q. But we are still very anxious to have you be specific and tell us why you need it.

A. I am not trying to obstruct you in that, Mr. Littman.

Q. I understand that. My purpose is to go into some details so that we can get the basis of it.

Now, we know, do we not, from your testimony thus far, that the detailed data we have at hand does not support your assumption as to gas purchase expense. We may agree on that?

A. I admit there is less than a 45-days' lag there.

Q. Just one other thing in this regard, which I would like to clear up before we go to the next subject.

Did you state in your testimony here a moment ago that it was possible to pay for gas in advance of receiving the revenue for it?

A. That it was possible to what?

Q. Withdraw that.

Was it your testimony, in answer, I believe, to one of Mr. Lee's questions, that the company paid for gas in advance of receiving the revenue for it?

[fol. 4654] A. Sure.

Q. Will you name the day, or any day of the month on which it is possible for Panhandle Eastern to pay for gas in advance of receiving the revenue for it?

A. We will pay for gas on the 20th of this month for gas purchased last month before the time when we have received pay from our customers this month for gas sold last month.

Mr. Goodman: Would you be specific about the dates?

The Witness: Yes. We get paid by Detroit on the 25th. On the 20th, we pay for purchased gas.

Mr. Goodman: Wait a minute, don't go so fast. You know there is more than that date involved in the picture you are talking about.

The Witness: No, that is predominantly the correct date.

Mr. Goodman: Just a minute, please. You have a reading on certain dates, a so-called cut-off period. Is that right?

The Witness: Yes.

Mr. Goodman: What is the date for that on sales? Without bothering to look it up, to me this is a simple

thing, and I want you to tell me wherein this question is wrong.

You pay and you charge for gas by the month. Consequently, the average period for the month of gas receipt and gas delivery is 15 days, isn't that right, in either case?

The Witness: Go on.

Mr. Goodman: That is the average, all right. In ad-
[fol. 4655] dition, in both instances, you have a period from the cut off to the day of payment, so that if you take the cut-off from the date of payment plus 15 days, you have the time lag in both cases, which may be compared. Isn't that right? Is there anything complicated about that?

The Witness: To me, it is.

Mr. Goodman: I see. All right.

I wish you would answer Mr. Littman's question by dates, rather than by general conclusions.

The Witness: Mr. Littman asked me if there was any day of any month where we pay for gas before we get paid for gas, and I say almost any day of any month prior to—

Mr. Goodman: (Interposing). Show that by reference to the cut-off period and the date of payment for sale of gas and for receipt of gas.

The Witness: Wait a minute. I am not answering that question. I am saying that we have to pay for gas this month to the extent "X" dollars on the 20th of the month, and we do not get paid by our customers until around the 25th of this month, so there is a period there of at least five days when we are using working capital—

Mr. Littman: (Interposing) Not more than five days, isn't that a more accurate answer?

The Witness: For about five days.

By Mr. Littman:

[fol. 4656] Q. Which is comparable with your 45-day lag?

A. Not at all. That is just one factor in the 45. My 45 spreads to the other expenses of operation, not alone purchased gas.

Q. I am, of course, speaking of purchased gas.

A. I cannot confine my remarks to that.

Q. Can you give us a specific example of any day in the month where you will have a lag greater than five days for the purchased gas expense?

A. I do not know.

Q. Name one. A. I do not know.

Q. Well, you have named one that had five days.

A. Yes.

Q. Can you name one that had six days?

A. No, I cannot name one offhand, either more or less than that period. That is about the characteristic period.

Q. That is the characteristic period, about five days?

A. But understand—

Q. (Interposing) Is that right?

A. (Continuing) But understand the gas in those two cases is for different periods of time, for different cut-off dates. That is why you just cannot generalize on it.

Q. Is it your testimony that five days is the characteristic period?

[fol. 4657] A. It is a characteristic period for that type of transaction, yes.

Q. You cannot give us any other day of the month on which your payment would be in advanced more than five days, can you, under any circumstances?

A. Let me think, I think I can. If we should stop selling a customer on the 31st of a month, we would still have to pay for gas on the 20th of the following month, and we get nothing from the customer. Is that right?

Mr. Littman: Will you read that answer back?

The Witness: Maybe that isn't correct.

Mr. Goodman: No, it is not.

The Witness: It is not.

Mr. Goodman: You would collect your check on the 20th of the month for the gas you deliver.

The Witness: I think that is right. I do not think that is a good case.

By Mr. Littman:

Q. Then you are unable to give us any example?

A. No, I think that is correct.

Q. Of greater than a five-day lag for payment of gas expense?

A. I wouldn't make it on such general terms.

Q. What will you say about it?

A. I say because there are different cut-off dates in- [fol. 4658] volved here, which point you just cannot get around, no matter how you try.

Q. According to your testimony, would it be true, Mr. Sperry, that the greater the credit period you receive from your vendors, the more working capital you need?

Mr. Culton: If the Court please, this witness has not said he based his 45 days on the lag. He said it was a judgment figure from a credit standpoint, and all of this interrogation is on the assumption as if he had said there was a 45-day lag on this gas and that was the reason for it.

Mr. Littman: If your Honor please, this gas purchase expense constitutes 30 percent of his entire requirement for so-called normal cash funds for operating expenses, and if he cannot sustain his 45-day lag on this item, then I say that he is probably in great error in arriving at his total allowance.

Mr. Culton: He has not based it on lag. He had based it on the judgment a man is not going to start business without cash on hand even though he may expect to sell his stock in trade for cash. He has not based it on lag.

Mr. Lee: I submit Mr. Culton made an objection and the question that is pending should either be allowed or disallowed before Mr. Culton makes an explanation of what he thinks it ought to be. It is a very important question that is pending.

Trial Examiner: It would not be very helpful to us at [fol. 4659] this stage of the proceedings to argue out these questions.

The Trial Examiner hasn't been convinced that the 45-day lag is applied to gas purchases and sales. It has been

made a component element of the general testimony of this witness that a 45-day lag is required or is involved in financing.

Mr. Culton: He has not testified he based it on lag.

Trial Examiner: But the Trial Examiner has been unable to recall any testimony of this witness that a 45-day lag is required as to gas purchases and sales, and in contrast with that, the testimony is apparently now that a five-day lag is at least typical.

Mr. Culton: So far as lag is concerned of this item.

Trial Examiner: So far as gas purchases and sales are concerned.

Mr. Littman: Which constitutes 30 percent of the entire amount.

Trial Examiner: There again, we are getting into an argument. Referring to the testimony of Mr. Sperry and in fairness to him, he has repeated that the estimate of 45 days is a judgment figure.

When that is analyzed and applied only to gas purchases and sales, it is reduced to a five-day lag. Am I not correct?

Mr. Wheat: Not according to the witness' testimony, because the witness stated it could not be reduced to a mathematical lag period since the cut-off days differed. I [fol. 4660] am simply quoting from what the witness has said, and I think that should be added to the statement.

Trial Examiner: I think this cross-examination is proceeding properly and that we are interested in Mr. Sperry's analysis of the several elements which go to make this judgment figure of 45-day lag.

* * * * * * * *

The Witness: By credit period, you mean what, Mr. Littman? Time elapsing between the reading of the meter and the time we have to pay them?

By Mr. Littman:

Q. Yes, or the time elapsing between the period when you get your gas.

A. I would say the credit period is the shorter.

Trial Examiner: There is one other business factor I do not think you have mentioned. You pay, of course, gas purchases by company checks?

The Witness: Yes.

Trial Examiner: And on what bank are they drawn?

{fol. 4661} The Witness: On a Kansas City bank.

Trial Examiner: How many vendors are settled with by check each month?

The Witness: There are a large number of checks.

Trial Examiner: Can you state what, on the average, is the period required for the collection of these checks and the return against the company?

The Witness: I suppose there is a two or three-day float there. Most of them go to Kansas and north Texas. There is probably a two or three day floating period. There is probably a two or three-day floating period between the time we receive checks from the customers. Those would tend to wash.

Trial Examiner: They would tend to wash, except in the comparative size of the two?

The Witness: Yes.

Trial Examiner: The reason I brought that up was because sometime ago it was stated a credit was made at Detroit.

The Witness: Yes, that was for convenience, of course.

Trial Examiner: For the settlement of the Detroit account?

The Witness: that does not help us in our collection on a per diem basis. It simply makes it more convenient for all parties.

By Mr. Littman:

Q. Now, you have just testified in response to my last {fol. 4662} question that the shorter the credit period that you receive from your vendors—withdraw that—you just testified that the greater the credit period that you have

for the payment to your vendors, the less working capital you would need. Is that correct?

A. If I understood your question correctly, Mr. Littman, I simply meant this, that the sooner you have to pay for your gas, the more money you have to have to pay it with. That is, the longer you have to use that money before it is reimbursed from your customer.

Q. You understand the credit period to be the period between the date the meter is read and the date the payment is made?

A. I have never heard that referred to, but I understand what you mean, I think.

Q. What is the credit period, as I have defined it, for gas purchase expense? Is it not 30 days, approximately?

A. Yes.

Q. 28 days?

A. 28 days.

Q. And what is your credit period with respect to gas revenues?

A. Approximately 45 days.

Q. Aren't you wrong there? You read the meter on the first of the month, do you not?

[fol. 4663] A. Yes.

Q. And you get paid between the 23d and the 26th of that month, according to your testimony, do you not?

A. Yes, I would say that was around 25 days.

Q. Around 25 days, which is approximately the same credit period in both instances, is it not? A. Yes.

Q. I believe you have testified on several occasions that Panhandle Eastern pays its gas vendors on the 20th of the month. Is my understanding correct?

A. That is right.

Q. Now, isn't it a fact that, under Panhandle Eastern's contracts, that company does not have to pay for the gas which it purchases until 30 days after the reading of the meter?

A. I do not know. It is our custom to pay on the 20th.

Q. You have not made a study of the contracts for the purpose of making such determination, have you?

A. Not in this case, no.

I would be surprised if it would be other than that. We usually recite in both of our sales contracts and purchase

contracts the day of the month on which the bill is to be rendered and the day on which it is to be paid. It is usually spelled out in the contract.

Q. I just want to ask you one more question about these [fol. 4664] gas purchases.

I have made the statement from time to time on this record that the gas purchase expense represents approximately 30 percent of your entire allowance of $470,000 for normal cash funds for operating expenses. Am I correct in that?

A. I have not figured it.

Q. Will you kindly compute it in percentage?

A. Well, in 1940, it constituted $1,187,000 out of a total of $5,150,000 gross expenditures. Now, wait a minute—

Trial Examiner: (Interposing) Take a few minutes, Mr. Sperry, if necessary, and compute the percentage that Mr. Littman has asked for. It will make the record more concise.

The Witness: All right.

Mr. Littman: I cannot give you that figure because you have asked me for gas purchase expense, and I have not that segregated from gas production expense. My gas expense is lumped here, including both gas purchased and gas production and our discussion to date has had to do entirely with gas purchased.

By Mr. Littman:

Q. Well, Mr. Sperry, isn't the figure which you gave me some time ago of $1,187,200 for 1940 and $676,400 for the first six months of 1941, the gas purchase expense?

A. No, that is gas expense, over-all gas expense.

Q. What do you mean by over-all gas expense?

[fol. 4665] A. There would probably be a considerable item there of production expense. We only buy half our gas. We produce about half of it.

Q. In other words, this amount of $1,863,000—

A. (Interposing) That does not constitute gas purchase expense on gas purchase contracts, I am confident.

Mr. Chamberlain: Exhibit 57 shows that.

By Mr. Littman:

Q. Exhibit 57, Column M, Lines 9 and 14, I am sure, shows that—

A. (Interposing) Is that an earnings or cash item?

Q. This is Mr. Watkins' exhibit, entitled "Statement of Gas Purchased from April 1, 1932, to June 30, 1941."

Now, Line 9 shows for 1940 that the company expended $1,090,106.83 for gas purchased and for the first six months of 1941, as shown in Line 14, Column M, the amount is $602,157.66.

A. You see, those figures would not tie into my cash figures accurately, in the first place because there is a lag between the cash expenditure and the earnings expenditures and receipts.

Q. But aren't these two figures comparable?

A. I would say that they should be roughly comparable.

Q. Now, in view of Exhibit 57, what is your testimony with respect to the $1,863,600 amount which you just dis- [fol. 4666] cussed a minute ago? Does that, or does that not represent the cost of gas purchased?

A. No; you mean the figures in my schedule?

Q. Yes.

A. I would say that it is not. I would say that there is some production expense in there too.

Q. Wouldn't you say certainly that the very large bulk of it was gas purchase cost?

A. I would think so, yes.

Q. If the production system expenses are included in your $1,863,000 figure, then you do not have them anywhere else, do you?

A. They might be, some of them.

Q. Are they in twice?

A. No, there would be no duplication.

Q. Can you tell me whether or not this $1,863,000 figure included in your working papers for the 18-months' period prior to June 30, 1941, includes all production system expense or not?

A. I cannot tell you without getting those figures broken down in Kansas City.

Q. Your working papers do not show that?

A. No, I have taken these figures right off my cash sheet. From my standpoint, you see, it does not make any

difference. It is money that goes out, and it goes out every [fol. 4667] month. That is the only thing I am interested in. I think the preponderant amount of it is gas purchased.

Q. Gas purchase cost? A. Yes.

. . . . . .

[fol. 4672] By Mr. Littman:

Q. Can't we agree that practically all of this amount of $1,863,600 for the 18-months' period preceding June 30, 1941, does, in fact, represent gas purchase costs?

A. I think I admitted that about fifteen minutes ago, before this wrangle started.

Q. I believe you said the majority of the amount is?

A. I think the predominant part is, sure.

Q. Could we agree that practically all of it is, within $100,000?

[fol. 4673] A. I do not see why not.

Q. That is our understanding, and in view of Mr. Watkins' figures, we won't be far from right if we say it was within $100,000, would we?

A. Furthermore, in answer to the question which gave rise to this argument, that does constitute slightly in excess of the 30 percent of the total figure which we are talking about.

. . . . . .

[fol. 4674] By Mr. Littman:

Q. Mr. Sperry, another item which you testified was included in your estimate of normal cash funds for operating expenses was the payment for wages. Is that correct?

A. That is right.

Q. Had you calculated the lag with respect to payments for wages? A. No.

Q. Do you have any idea what the actual lag is?

A. No. I know the dates at which wages were paid.

Q. Do you mind stating for the record the dates on which wages are paid by Panhandle Eastern Pipe Line Company. That is to say, the date of the month?

A. Field employees, other than supervisors, are paid for a fiscal week, beginning Friday morning to Thursday night. Employees, other than supervisors, are paid each Thursday morning to Wednesday night. Office and Field Department Supervisors are paid for the first half of the month on the 15th of the month, for the last half of the

month on the first of the following month. Officers and department heads are paid by the month on the last day of the month.

Q. Can you give us the breakdown as between those four classifications?

[fol. 4675] A. I haven't got them. I haven't broken them down at all.

Q. Do you have any idea which of those four classes constitutes the largest expense over a given month?

A. The weekly payroll constitutes our largest payroll as distinct from the semi-monthly and the monthly.

Q. Now, as to the weekly employees, what is the maximum lag that you would have for the employees that are paid by the week?

A. Well, they are paid immediately their week is finished. They work from Friday to Thursday night and are paid just as soon as the check can be prepared.

Q. Now, as for the first week of a given month—

A. (Interposing) They would be paid on the 7th of the month.

Q. They would be paid on the 7th of the month?

A. If it happened to be the right day, yes.

Q. And the revenues for that month are derived by Panhandle Eastern during the next month, are they not, on or about the 23rd or 25th of the month? A. Yes.

Q. So that as to the one week, that is the first week of [fol. 4676] the month, you have a lag of how much?

A. Well, according to that way of figuring it, we would have about a 48-day lag.

Q. A 48-day lag? Well, isn't that generally the correct way of ascertaining lag?

A. As I say, I haven't explored it from that angle, Mr. Littman. My whole study here has been to determine the amounts of cash that have gone out of the company and to average those over a period of 18 months, which is certainly a fair period, a conservative period to average them, and then to simply say that from a judgment standpoint I feel that we would be in danger of either running out of money or of sacrificing our credit if we didn't have 45 days cash on hand.

Now, you see this is a perfect example of the approach I haven't made to this problem. This is one of the things that a detailed accountant's report might ascertain for us,

but it was impossible to obtain that—impracticable to obtain that, so I haven't approached it from the standpoint of breaking each one of these down into days lag, as you are trying to do. My judgment is that we need 45 days cash in the business.

Q. Well, I am going through the component elements to see whether or not the facts justify your conclusion, Mr. Sperry.

[fol. 4677] A. Well, that is all right.

Q. And that is why I am taking this much time. Now, starting business on the first day of January of a given year, Panhandle Eastern pays its weekly employees at the end of the first week, does it not?

A. Yes.

Q. And does not collect the revenue derived—at least in part—from those services until approximately the 23rd to 25th of the succeeding month, is that right?

A. That is right.

Q. Am I correct in saying that, generally, the proper method of determining the lag with respect to that first week's wages is by counting the days from the 7th day down to the 23rd or 25th day of the succeeding month. Is that right? A. Yes.

Q. I believe you said that the lag for the first week would be about 48 days, is that right?

A. I would think so.

Q. Now, what would the lag be for the weekly employees for the second week's wages in January?

A. I would say seven days less than that.

Q. That would be 41 days.

. . . . . .

[fol. 4678] Q. Now, with respect to the third week's wages, the lag would be 7 days less [then] 41?

A. Right.

Q. Or 34 days. Is that right? A. Right.

Q. And the lag would be 27 days for the fourth week's wages. Is that right? A. Right.

Q. And so on until you got down to the 25th day of the succeeding February. Is that correct?

A. That is right.

Q. So that your maximum lag is 48 days for the weekly employees. Is that correct? A. Right.

Q. Now, as to the employees who receive their wages on the first and 15th of the month, those employees will have rendered two week's services in January before they receive any remuneration, would they not? A. Right.

Q. And the lag for those employees would be a maximum of 41 days, is that right? A. Right.

Q. And, of course, successively less until we get down [fol. 4679] to the 20th of February? A. Right.

Q. Now, the monthly employees—and I believe you are one of those, are you not? A. Yes.

Q. The lag, for instance on your salary check would be approximately 29 days, would it not? A. Yes.

Q. So that the average lag for payments of wages, which is one of the items included in your estimate for "Normal Cash Funds for Operating Expenses", is something less than 45 days which you assumed. Is that correct?

A. I would think it would be on that approach, yes.

Q. Now, another item that you have is called "Ordinary Maintenance." When are those ordinary maintenance expense paid? Can you give us any idea on that?

A. No, I don't think you can generalize on that. They are paid when they are incurred. We pay our bills at intervals, convenient intervals.

Q. Approximately 30-day intervals, would you say?

A. No, less than that, I think we pay in less than 10 days ordinarily, a week or ten days.

Q. A week or ten days after receipt of the bill?

A. Yes.

[fol. 4680] Q. Ordinarily, when are the bills rendered? The first of the month?

A. I don't think you can generalize on that. There are as many customs as there are people in business.

Q. Now, ordinary maintenance consists of labor and materials, does it not?

A. Yes, that is right.

Q. Now, is the labor which you include in the category of "Ordinary Maintenance" the same or different than that included in the item which you have called "Payment For Wages"?

A. It is all lumped in there together, all maintenance and all labor.

Q. Is this a different species of labor?

A. No, it would be the same. The labor would be included in the maintenance. You see, when we run our books, we divide labor into two categories, operating labor and maintenance labor, and they are so classified on our books. For purposes of this cash study, it is all lumped in together.

Q. Now, the labor incurred in connection with ordinary maintenance consists of laborers on Panhandle Eastern's payroll, does it not?

A. It consists for the most part of regular employees.

[fol. 4681] Q. And they are weekly employees?

A. Once in a while there will be a few other employees that are hired for particular jobs and then are released, but the preponderant part of our labor cost every year is to regular employees and our regular employees do most of our maintenance work.

Q. And insofar as their pay is concerned, they would fall into the category of the weekly employees, would they not? A. Yes.

Q. And you have already discussed the approximate lag with respect to those employees, have you not?

A. Yes.

Q. Now, as to the materials used for maintenance, doesn't that consist largely of pipe, tubing, and well equipment and the like?

A. It embraces all of those items. I would say that pipe, as such, wouldn't consfitute a large percentage of the total. I think that the average maintenance expenditure is mostly smaller stuff than pipe. We keep an inventory of pipe all the while.

Q. You don't pay cash, do you, for the materials used?

A. No; we pay as soon as the bill is rendered or immediately after a bill is rendered.

[fol. 4682] Q. And it takes some time for the bill to be rendered after the delivery of the materials, does it not?

A. There, again, you can't generalize. You go to a hardware store and buy—on small supplies you probably would pay cash for it, kept in the petty cash books. If you ordered from a factory it might be the first of the next month before you got your bill for it. There is just no universal rule of thumb on it.

Q. Well, in any event, some time elapses between the date when you receive the material and the date when you pay the bill?

A. On the average there would be a few days, anyway.

Q. Then you have an item called "Overheads." Can you tell us anything about the lag on payment of overheads?

A. Well no, not very much. Your overheads would be your rents and your gas and electric, and things of that kind. Constant expenses, and some of those are prepaid. To the extent they are prepaid, they would be taken out of this and put into prepayments for the purpose of this study. Some of them are paid after the services are rendered, like the gas bill, electric bill, telephone bill. You just can't generalize on those small items.

Q. Thus far, considering the items that we have discussed, I fail to find any that would justify the taking of a lag of 45 days. Can you name some that would—

[fol. 4683] A. (Interposing) I can't name any specifically. I am still of the opinion that 45 days cash requirement is not only necessary to maintain the credit of the corporation, but it would be dangerous to cut it below that.

I also would like to point out, Mr. Littman, that in my testimony I pointed out that no single 45-day period is exactly comparable to another 45-day period. There are many 45-day periods which would take a lot more cash than the average which we have requested here, just as there are 45-day periods which would require less cash, but a fair, satisfactory, minimum average would be the amount specified here, $470,000, here it is.

Q. You can not, however, give us any detailed items of expense upon which you base that conclusion, can you?

A. I think you have to have experience in those matters to properly judge what the proper amount is, just the same as you do in your family budget. I couldn't come to you and say that a $100 balance was all that was necessary for you to keep in your family exchequer in order to pay for the bills that come in, but if I had your income and expenses over a period of five years, I could pretty well know how much of a bank balance I would have to have in your place to pay those family bills when they came in.

The same thing is true of a corporation. You just have [fol. 4684] to sit on the lid and watch the money go out

and after a while you begin to get the feel of it. You begin to realize how much money you do have to have in order to keep your bills paid and your credit good.

Q. Well, I understand, Mr. Speery, that you have an opinion as to the amount of money that you would like to have as cash working capital, and, of course, you are entitled to your opinion on that subject, however, what I would like to know is whether or not, in your opinion, you feel that these amounts are justified from a standpoint of regulation and for rate making purposes?

A. Let me answer that in three ways: First, I do think it is the minimum amount that we could satisfactorily get along with.

Secondly, I point out to you that we customarily keep three and four times this amount, and have regularly over a period of years, and that we are uncomfortable if we don't have several times the amount that we ask for, for inclusion in the base rate.

Third, I would like to point out that there is another factor and that is, if you are down to your last dollar you haven't any credit and that you have got to have ample funds in your till at all times or you lose your credit.

Now, the study which I have made here and the figure [fol. 4685] at which I have arrived for these purposes of $470,000 cash, in my opinion, is the minimum satisfactory amount. It is the absolute irreducible minimum under which I wouldn't dare go, and I wouldn't feel that I was able to take this company to the money market for funds unless I had much more than this in my till.

Q. Well, for corporate purposes you feel it would be advisable to have this amount and more?

A. It isn't a case of advisable; it is a case of necessity. How much confidence would you have in the ability of this corporation to carry out its contract and to carry on its business without any idea of expansion at all, if you found that we had less than 45 days requirements of cash in our books? You would think we were crazy if you saw a $70,000,000 corporation with a $20,000 bank balance. What would you think? You would know darn well we were one jump ahead of the sheriff, and, perhaps, not quite one.

Q. Well, Mr. Sperry, this amount that you provide, $470,000 for so-called "Normal Cash Funds for Operating Expenses," was not based on any actual company experience with respect to the amounts required by that company. Is that right?

A. Yes, it was based upon the recited experience here over an 18-month period of actual expenditures for [fol. 4686] specified purposes and I have been careful to exclude from those items certain other items or certain items which are not, perhaps, properly includable for purely operating expenses, such as the taxes which are excluded here. In other words, the only purpose of this study was to indicate the minimum amount necessary for these particular purposes based on 18 months experience.

Q. Based on a 45-day lag?

A. No, based on 18 months experience to show what the average per diem expenditure of cash had been and, after arriving at the per diem expenditure, then using judgment only as a factor, we estimated that it wouldn't be satisfactory for us to have less than 45 days cash with which to do business.

Now, let's not confuse 45 days lag with 45 days cash requirements because they are not the same. We have talked about lag simply in an interpretative way on some of these figures, but the fact remains that what we are claiming here is enough cash to do 45 days average business month in and month out, and that is not too much to ask, in my opinion.

Q. But you have no details to support the 45-day lag period, have you?

A. I am not trying to support 45 days lag, I am saying that I think it would be unsafe for us to have less than 45 days cash on hand, which is a different matter.

[fol. 4687] Q. But you have no details to support the 45 day period?

A. I have told you that when we discuss lag, that I have not been able to scientifically and through a firm of accountants, ascertain that that is exactly the exact number of days, but I tell you, as treasurer of the corporation, that in my judgment it would be unsafe to have any less cash than that on hand.

Q. That is based on your general judgment?

A. Based on judgment, yes.

Q. And not on any specific data?

A. No, but it is in the light of the experience cited here.

Mr. Wheat: By "the experience cited here," you mean that shown on your exhibit?

The Witness: In my working papers, yes.

By Mr. Littman:

Q. Now, you have testified that you estimated the amount of cash working capital required for emergencies in the amount of $100,000. Is that correct?

A. Yes.

Q. Now, will you name the emergencies that this amount of $100,000 is supposed to cover?

A. I can give you some examples of that, yes. I have two of them in mind particularly.

[fol. 4688] In 1937—I think it was '37, it was soon after I came with the company—we had a line break in Texas. It was strictly an act of God. It couldn't be foreseen, it swept out a river crossing, and within 15 to 20 days it required an expenditure of cold cash on our part of very close to $100,000.

Now, you will find no reference to that in our Earnings Statement. It didn't affect earnings at all. It never appeared in our Income Account, but it hit the till for the amount that was necessary to effect repairs and effect repairs quickly.

Now, it is a perfect example of the kind of emergency that can arise and if you don't have cash to meet it, you are just plain out of luck.

Now, I have also in mind such accidents as failure of collections. Supposing, Mr. Lee, that something happened to the Detroit Company that made them delay in their payment of their bill to us for a few days. It is hard to conceive of a thing happening that would delay very long because their credit is good and they pay on the button, but suppose there is an air raid on Detroit and the bank should close for four or five days. Where would we be sitting here without that check for eight or nine hundred thousand dollars?

[fol. 4691] By Mr. Littman:

Q. This $100,000 line break that you spoke of a few minutes ago, Mr. Sperry, how were those repairs of the line break charged? On the line of the company?

A. No, I don't know. Probably construction work in progress, but I don't know. That, again, is an accounting matter.

Q. Well, do you know whether or not it was all charged to maintenance or repairs or whether it was charged, at least in part, to the depreciation reserve?

A. No, it might have been replacements; it might have been repairs; it might be improvements; it might be permanent property or it might simply be in anticipation of the collection of insurance, but the fact remains it requires $100,000 or approximately that for a period of two or three months, and if we didn't have that money, we were embarrassed. We did have it.

Q. Well, do you know how many pipe lines were destroyed by this catastrophe?

A. No; I think a mile or two swept out, but I am not sure. It was a shallow river crossing and the pipe was not buried very deep, and a cloud burst came and swept [fol. 4692] away a good deal of line.

Q. Now, you know, as a matter of fact, do you not, Mr. Sperry, that the cost of replacing that line would be charged to the depreciation reserve?

A. I don't know where it was charged, that is my point. I only know it required cash.

Q. Well, wouldn't you want to know where it is charged before you make an allowance for such an emergency in working capital? A. No.

Q. That wouldn't make any difference to you?

A. No, Mr. Littman. I have indicated and have given you figures to support the minimum number of dollars that I think we can operate our company at, and that is around $470,000. That is minimum.

Q. It is this $100,000 item I am talking about?

A. Yes; now in addition to that, I think it is only business prudence and it is necessary for the credit standing of this corporation that we have a slight margin, usable margin, if you please, so that if additional expenditures

come about or if there is a period of 45 days when $470,000 is inadequate, that we will have a little kitty to use, and for lack of a better figure I have set $100,000.

Now, I can't prove to you whether $50,000 is the right [fol. 4693] figure or $200,000 is the right figure, but there should be a little margin of safety there.

Q. And you are not interested in what that $100,000 is to be used for, whether it is to be used for capital replacements or otherwise, are you?

A. So long as it is a cash requirement that needs to be met immediately and which can not be immediately reimbursed, I am not interested. It is working capital that is required for the daily operation of the business to meet contingencies which are recurrent, but which cannot be adequately foreseen.

Q. Why do you have a depreciation reserve?

A. The depreciation reserve is a bookkeeping item, Mr. Littman.

Q. Yes, I understand that, but what is the purpose of it?

A. I suppose it is to charge-off your property over the life of the enterprise. It isn't to produce cash.

Q. Isn't that one way of providing cash to take care of some of these items?

A. Sometimes it operates automatically to produce cash but that isn't the purpose.

Q. Let me see if I understand your theory of working [fol. 4694] capital. Do you mean to say that it is your theory of working capital that every dollar of cash that a company has in its till is necessary working capital?

A. Not at all. My study wouldn't indicate that I thought that, would it?

Q. Well, don't you know, Mr. Sperry, that any items of cash that are spent for purposes of capital replacements don't have any place whatever in a working capital allowance?

A. That may very well be, Mr. Littman. I am merely saying this that there are a certain number of dollars, which I believe are $470,000, necessary to the day-in-day-out operation of this business without any provision at all for the unexpected contingency. While $470,000 for that one purpose may be adequate, there should be a little

margin above that for the contingencies and to make up for the uneven flow of cash, and that is the figure of $100,000 which I am using.

Q. Isn't it a fact, Mr. Sperry, that in order for this $100,000 cash for emergencies to be allowable in the rate base as working capital, it would necessarily have to be for the purpose of maintenance and repairs only. Isn't that correct?

A. Well it might be, it might be or to provide for the uneven flow of cash.

[fol. 4695] Q. For maintenance or repairs?

A. Operations.

Q. Not capital expenditures, is that correct?

A. All right, all right, yes.

Q. Well then, that being the fact, you cannot say that every dollar of the $100,000 that was expended by your company for the catastrophe that occurred in Texas, to which you alluded a few minutes ago, was required to be maintained at all times in working capital?

A. No, but a part of it might.

Q. How much of it? A. I don't know.

Q. Well, certainly only that part of it which was required for maintenance and repairs?

A. Perhaps, and, perhaps that is $50,000 or perhaps it is $200,000, I don't know. I have taken as a judgment figure $100,000. Now, that may be too high or it may be too low, but, in principle, I think that it is sound.

Q. Do you know of any instance where Panhandle Eastern Pipe Line Company has expended $100,000 in cash for maintenance or repairs on an emergency?

A. No, but I know of a case where cash fluctuated from month to month by as much as $182,000.

[fol. 4696] Q. What does that have to do with emergencies?

A. And that is for purely operating costs. That arises out of the nature of our business which is seasonal and it is one of the contingencies for which this $100,000 is expected to provide.

Q. Mr. Sperry, am I correct in understanding that this $100,000 that you have provided for emergencies is not confined to the cash required for maintenance and repairs?

A. No, I didn't say that. I say that it is to provide for emergencies and contingencies which cannot be adequately foreseen but which is sure going to happen from year to

year, and that among those contingencies are such things as line breaks which might involve additional expenditures for maintenance and other operating costs which could be paid for only out of this $100,000 kitty.

Q. Well, have you provided enough in this estimate to take care of capital replacements?

A. No, we made no attempt to do that. This is for purely operating purposes.

Q. All right, such as maintenance and repairs, or what?

A. Or uneven flow of cash or for default in collections or for other contingencies.

Q. Well, your title "Cash for Emergencies" embraces [fol. 4697] a cushion to take care of an uneven flow in cash?

A. Yes, that is [an] contingency—an emergency, yes.

Q. You call that an emergency?

A. It might be.

Q. Then by "emergency" you are not referring entirely to such things as line breaks?

A. Not entirely physical, no. We have in this company, Mr. Littman, chiefly seven or eight customers. The default on the part of anyone of those customers in any one month, the delay in their paying us might give us a cash emergency. I don't say it is likely. Most of our customers are of good credit standing, but supposing through no fault of their own they should fail to pay us some month, without a reserve for a contingency of this kind, it might embarrass us.

Q. Do you know of any instance over the approximately 10 years of life of this company where any large customers failed to pay on time? A. Yes.

Q. When?

A. My recollection is that the Cities Service Gas Company in Kansas City, which is one of our large customers, didn't pay us this year for around five months' gas. Now, [fol. 4698] I have forgotten what that amount was, but it was a considerable amount. The reason was this: That their old contract with us had expired, a new one had, for certain reasons, not been negotiated, and until it was negotiated they withheld funds.

It was perfectly ethical on their part, but it deprived us from—I have forgotten—a good many thousand dollars of revenue that was due us.

That is a perfectly possible contingency, a perfectly possible emergency for which this cash should be available.

. . . . . .

Q. Mr. Sperry, you are not testifying that the only cash that this company is ever going to have on hand is the amount that you are providing here for working capital?

A. No, I am talking about cash which we require for the day-to-day operation of the business.

[fol. 4699] Q. Well, you are going to have, at all times, large sums of cash on hand such as cash that is accumulated for the payment of taxes that are not paid until the year after, such taxes are incurred?

A. Not for purposes of this study.

Q. You are going to assume that the company is going to be "broke" except for the cash that you are providing here?

A. I am providing here for minimum amounts of working capital cash, without which I think the company would be in danger of losing its credit.

Q. Do you provide a reserve for bad debts and operating expenses? A. No.

Q. I believe if you will check that, I think you will find—

A. (Interposing) We have a reserve in the Income Account but it isn't represented in cash. There is no cash in any figure here.

Q. Now, will you name or describe an emergency—I am speaking now of a physical emergency—that would require the outlay of $100,000 of cash for maintenance or repairs? A. I can't do that.

[fol. 4700] Q. It would have to be a pretty big sized one?

A. Yes, that is only one of the contingencies I have mentioned.

Q. Do you know that Mr. Biddison testified here that a pipe length less than 40 feet might constitute a repair or a charge to maintenance, and that a damage or replacement to more than 40 feet of pipe would constitute a replacement through charges to the depreciation reserve?

Mr. Wheat: You are speaking now of the accounting phase of replacing pipe, are you?

Mr. Littman: Yes.

The Witness: No, I am not familiar with what the line of demarcation is.

By Mr. Littman:

Q. You are not familiar with the Commission's System of Accounts with respect to how such items are charged?

A. No, I am not an accountant, Mr. Littman, I have nothing to do with the accounting for this company.

Q. You are not an engineer? A. No.

Q. Well, then, in so far as physical emergencies are concerned, you cannot describe or imagine one that would require anything like $100,000 for maintenance or repairs can you?

[fol. 4701] A. Yes, I can imagine one, but I don't know that I can justify it.

Q. Well, let's have your imagination on that subject?

A. Well, I don't know, Mr. Littman, on physical matters to what extent $100,000 would be used up, but certainly a company which does twelve or fourteen million dollars worth of business a year and which has assets of $70,000,000 is subject to contingencies which can't be foreseen, and to meet which $100,000 is a very modest sum, in my opinion.

. . . . . .

Q. Well, do you agree that in so far as physical emergencies are concerned, you should not provide any amount in excess of that which should be charged to maintenance or repairs? A. Or operating expenses.

Q. Or operating expenses? A. Yes.

Q. In other words you agree that you should not make any provision here for capital replacements?

A. That was not in my mind at all.

Q. Now, if Mr. Biddison is correct in stating that any-[fol. 4702] thing in excess of 40 feet of pipe would be from an accounting standpoint a replacement, you have to have quite an imagination to imagine the number of catastrophies that would occur to use up $100,000 at one time?

A. Unless the physical happening increased your operating expenses materially.

Q. So that you cannot tell us how much of this $100,000 is just for the purpose of leveling off the amount of cash

that you want on hand for smoothing out purposes and how much of it is for the actual physical emergencies, can you?

A. No, I can't tell you whether $50,000 or $200,000 is the right amount, or what part of the $100,000 should be earmarked for this, that, or the other purpose.

Q. It is simply—

A. (Interposing) A judgment figure, completely.

Q. And you have no details to support it?

A. No, except the testimony I have just given.

Q. Are the extraordinary losses and serious accidents, covered by this item of cash for emergencies, matters which are covered not fully by insurance?

A. They might or might not be covered by insurance, I would say. To the extent that they are physical, they might be. To the extent that they are not physical, they wouldn't be, of course.

[fol. 4703] Q. In other words, you can't tell us whether these extraordinary losses and serious accidents are those which are not fully covered by insurance?

A. No, as a matter of fact; I haven't included in my claim for working capital, Mr. Littman, articles of that nature and I might very well have done so. There are a number of things which I could have claimed as properly includible in working capital which I have left out and among them are deferred costs, pending insurance adjustments; for instance, I have made no claim for that item in my working capital study and yet it is probable that it is perfectly justifiable to be included.

I have not included, in my working capital study, advances to employees, deposits with agents or good-faith deposits, deferred legal expenses of a nature of retainers, all of which are items of expense of a corporation which might properly be included in a working capital basis, but those things are not in here and to the extent that they are not in here, you might earmark them against the $100,000 kitty.

Q. Well, doesn't this $100,000 allowance cover losses which could not have reasonably been foreseen and provided for?

A. You mean losses to physical plant?

Q. Yes. A. No.

[fol. 4704] Q. It does not?

A. No. That would be a capital expenditure, wouldn't it?

Q. Well, what do you say? A. I think it would.

Q. You think it would? A. Yes.

Q. Now, another amount that you have provided for in your cash working capital is $200,000 for "Minimum Bank Balances". A. Yes.

Q. Now, that is all in addition to the $100,000 item to which you alluded a few moments ago and in addition to the $470,000 that we discussed this morning.

A. Yes. You will notice I said a minimum balance of $200,000, not an average balance, a minimum balance. I base that figure of $200,000, first, on my experience with the banks and their requirements for banking corporations of this kind and, secondly, upon a definite exploration of the subject which I made with Mr. Kemper, President of the Commerce Trust Company in Kansas City, which bank has our active account. We keep in that bank $700,000 or $800,000 or $900,000 at all times. We check against them. In many cases we will draw 25,000 or 30,000 checks a year against them. Our activity is considerable.

Furthermore, we asked them for a good deal of credit [fol. 4705] information. We checked with them all of our credit risks every year, we checked with them all of our country bank balances every year. We bank with a lot of small country banks, petty checking accounts. Those have to be checked. They do a lot of work for us.

Now, I asked Mr. Kemper in a formal letter, and without discussing it with him orally, in the light of the activity which had taken place in our account in the past years what he figured we would have to keep in his bank in the way of a minimum bank balance to support the activity. I have had the following letter from him dated July 31.

Mr. Wheat: 1941?

The Witness: Yes.

"We are pleased to have your letter of July 29 in which you make inquiry as to the minimum gross balance your company should maintain with Commerce Trust Company in order to compensate us for the activity of your account.

"We have had our Analysis Department cast up your figures and it appears that on the basis of the activity in the last three months compared with past activity and with some allowance for additional business in the future that you should maintain with us a minimum balance of $200,000 or more.

"Very truly yours, James M. Kemper."

I don't believe that that is at all out of line with what other banks would require. We carry balances in eight [fol. 4706] different banks, sizeable balances. We don't use them as much as we do the Commerce Trust Company, but were we to concentrate all of our funds in one bank and let that bank do all of the work, I don't feel that we could let our balance go below the $200,000 and I think we should keep an average balance of substantially more than that in the account in order to compensate them for their activity.

By Mr. Littman:

Q. What balance did you have in your bank accounts at June 30, 1941?

A. I don't know, but at the present time we have got around $4,000,000. I can look up the June 30 figure, if you wish it.

Q. As a matter of fact, I believe you testified that it amounted to $7,446,000 as of June 1941. Is that correct?

A. Yes, that is correct.

Q. In other words, you haven't had any difficulty keeping considerable cash balances in your bank accounts, have you?

A. We have always carried large amounts of cash, because we feel that large amounts of cash are necessary in our business, much larger amounts than we have asked for an allowance on for working capital purposes.

Q. Now, I refer you to Mr. Watkins' Exhibit No. 49 which is the company's income statement, particularly to lines 10, 17 to 20, inclusive. Isn't it a fact that the company's income deductions for depreciation and taxes [fol. 4707] amount to well over $4,000,000 annually?

A. For depreciation and what?

Q. And taxes.

A. Well, I haven't the exhibit before me.

(Whereupon, Exhibit No. 49 was furnished the witness.)

The Witness: In lines what?

Mr. Littman: Exhibit 49, line 10 and lines 17 to 20, inclusive.

Mr. Wheat: Mr. Littman, may I ask you, are you asking a question on the basis of any cash item and depreciation or was that included in your question?

Mr. Littman: I am merely asking him whether or not the company deducts from income the amount of approximately $4,000,000 a year for depreciation and taxes.

Mr. Wheat: We will stipulate that whatever is shown on this exhibit is deducted.

By Mr. Littman:

Q. Do you know that?

A. Yes.

Q. It does amount to well over $4,000,000 a year, doesn't it?

A. Apparently from these figures.

Q. Now, depreciation is a non-cash item of expense, is it not?

A. Not necessarily, no.

[fol. 4708] Q. Well, most of it is a non-cash item, isn't it?

A. Not necessarily. A good part of it might go for replacements immediately—

Q. Well, what is the fact?

A. (Continuing) in which case it is definitely a cash item.

Q. Well, certainly as to that part which is not expended in a given year there—

A. (Interposing) Let me say this: You can't depend on your depreciation being a non-cash item; ordinarily and sometimes it is.

Q. Do you know what the balances were in the depreciation reserve as of June 30, 1941.

A. Yes, around eight or nine million dollars.

Q. Certainly those deductions were not cash items to that extent over the life of the company.

A. No, that is right. The first few years of an enterprise like ours they are usually not cash items.

Q. We can agree that for the most part, certainly in the earlier years of the company, they are not cash items. Is that right. A. That is right.

Q. Now, as regards taxes, particularly income taxes, those are not paid until the year following the year in which they are incurred. Is that correct?

[fol. 4709] A. In some cases, yes.

Q. How about Federal income tax?

A. That is right, there is a period there between the time they have accrued and the time they are paid.

Q. Well, a considerable period, is there not?

A. Yes.

Q. These two items are a source of funds amounting to approximately $4,000,000 for the year, are they not?

A. Surely.

Q. And the simple fact of the matter is, Mr. Sperry, that these two items alone provide a source of funds far in excess of the so-called necessary minimum cash balances. Is that correct?

A. Granted that that is so, I don't see that that is pertinent to our discussion. We are asking for an allowance of certain cash for working capital purposes, working capital purposes by which we mean funds necessary for the doing of day-to-day business. In that are around $470,000 irreducible minimum for operating expenses, a $100,000 kitty and we have added $200,000 for the keeping of balances; whether they are available from other sources or not is immaterial. If that is a requirement that we must meet in order to keep in business in the customary way, then we should have allowance for it.

* * * * * * * *

[fol. 4713] Louis F. Sperry, a witness previously called and sworn, resumed the stand and testified further as follows:

Cross-Examination—Resumed.

By Mr. Littman:

Q. Mr. Sperry, on December 31, 1940, your company's balance sheet showed a liability for taxes accrued of $2,333,000. Is that correct?

A. I have not that balance sheet here, but that sounds like it was correct. Have you got a balance sheet you can show me?

Q. I think we have. I hand you a copy of Exhibit 48.

A. Thank you.

Q. Which is the company's balance sheet submitted by Witness Watkins.

A. Taxes accrued of how much, Mr. Littman, please?

Q. $2,333,000 as of December 31, 1940.

[fol. 4714] A. Yes, that is correct.

Q. When is that sum payable to the Government?

A. To the extent that that is income or excess profits tax, it becomes payable during a period several months later than the December 31 date that you mentioned. I assume, without checking it, that a large part of that tax reserve is probably in the nature of income and excess profits tax accrual.

Q. When was that sum paid to Panhandle Eastern by the customers?

A. That item, Mr. Littman, is an accrual item and is deducted from time to time as an expense of doing business on our books, presumably out of the revenues which the customers pay us regularly during the calendar year.

Q. You mean month by month, do you not?

A. Yes.

Q. Throughout the year 1940, and some of it was accumulated in previous years, was it not?

A. Possibly, yes.

Q. So that even if no allowance whatever were made for cash working capital, your company would still have a large part of the $2,333,000 in its till at all times, would it not?

A. I wouldn't say that it would have a large part at all times. It would have a portion of that accrued from month to month.

[fol. 4715] Q. Well, your total allowance for cash working capital amounts to $900,000, does it not, as shown by your Table III of Exhibit 74?

A. What is that, $900,000?

Q. $900,000 cash. I have reference to items 1 to 4, inclusive.

A. Item 4 is not a cash item. Items 1, 2, and 3 aggregate ~~$770,000, but item~~ 4 is a prepayment item which is not a cash item—yes, sir, it is too.

Q. I assumed that was right.

A. Yes, surely, $900,000.

Q. $900,000—

A. That is right.

Q. (Continuing) —is the amount of cash that you estimate is required for cash working capital?

A. Yes, that is correct.

Q There would certainly be, at least, that much cash on hand at all times in the till accumulated for income tax, would there not?

A. There is no assurance of that, no. In other words, there might be many times during the year when our total cash on hand might be substantially less than the accrued tax item.

Q. Well, do you mean less than $900,000?

A. Yes, it might conceivably be. It has many times in the past. Our cash balance, many times in the past, has [fol. 4716] fallen far below $900,000.

Q. Those were in the days when taxes were much lower?

A. Yes. They were in the days when the company was much less profitable than today, too.

Q. But that is not the fact today, of course?

A. That is not the fact today, but there is no reason for thinking that it might not recur.

Q. Well, what are the probabilities?

A. I would say that insofar as management can control it, that our cash at all times will much exceed $900,000 and we will try to keep it there from the standpoint of maintaining our own credit.

Q. In other words, you would expect this condition that you have described to continue in the future and that you will at all times have at least $900,000 cash on hand for the payment of taxes?

A. We attempt, as a management policy, to have not less than $1,500,000 in cash at all times for purposes of maintaining credit.

Q. Now, you have made an allowance, as shown by item No. 5 on Table III of Exhibit 74, of $635,000 for materials and supplies?

A. Yes.

Q. Am I correct in understanding that your Tables I and II show further details with respect to that item?

[fol. 4717] A. Yes, that is correct.

Q. As a matter of fact, the details show the amount to be somewhat in excess of the round figure of $635,000?

A. Yes.

Q. Namely, $635,479.26?

A. That is correct.

Q. You testified on direct examination that the materials and supplies on hand at June 30, 1941, amounted to $261,000, did you not?

A. Yes, sir.

Q. Is this amount reasonably representative of the materials and supplies which have currently been kept on hand by Panhandle Eastern Pipe Line Company and its affiliates over the past few years?

A. Without meaning to be exact, I should say that that was in line with what we usually have kept in the past.

Q. And reasonably representative?

A. I think so, yes.

Q. Do you know what the inventory of materials and supplies was at June 30, 1941?

A. I can give you that, I think.

Q. I believe Exhibit 48 would show that.

A. I have it in the official statement for Panhandle Eastern for June 30, 1941; materials and supplies aggregate in round figures around $269,000.

[fol. 4718] Q. Exhibit 48, page 1, line 13, column "N", shows the amount to be $268,861.80.

A. I would think that that was correct.

Q. Now, the inventory of materials and supplies at June 30, 1941, was the highest of the past seven years, was it not?

A. I believe it was.

Q. Exhibit 48, line 13 of page 1, shows that to be the fact. Do you want to see the exhibit?

A. No, I do not care to. I think that is correct, because by that time management had seen the necessity of adding materially to our inventory of parts, because it had foreseen the possibility of stringency, it had also observed the fact that we had had inadequate supplies in some departments previous to that, which at times embarrassed us so that we were already at that time accumulating heavier materials and supplies.

Q. At the end of 1940 the materials and supplies on hand amounted to $212,314.42. Does that sound reasonable?

A. That sounds like a correct statement.

Q. And at the end of 1939 the amount on hand was $159,321?

A. That sounds like a correct statement.

Q. And in 1938 the amount was $165,267?

A. That sounds reasonable.

[fol. 4719] Q. In 1937 the amount was much greater, namely, $237,963. Does that sound right to you?

A. That sounds correct.

Q. I am reading from Exhibit 48, line 13. At any rate, you have taken the sum of $268,861 as of June 30, 1941, which is the highest amount of materials and supplies that has been on hand in the past seven years, and used that as the starting figure, did you not? A. Yes.

Q. And you added a considerable amount to that figure to arrive at the total of $635,000, is that correct?

A. Yes, a very considerable amount, a very considerable percentage.

Q. It amounts to better than twice—

A. (Interposing) Yes, it is over 200 per cent.

Q. And you have arrived at the additional amount by adding the estimates of materials and supplies that you expect will be required for a period in the future?

A. For the present and the immediate future.

Q. The details of which you gave in your direct testimony?

A. Yes, I think I gave details of it and it was worked out in great detail in my work sheets to which you have had access.

Q. Have you made a study and analysis of the materials [fol. 4720] and supplies actually issued during 1940 and 1941?

A. I wish you would clarify that just a little bit, if you will.

Q. Do you know how much in dollars of materials and supplies were issued in 1940 and 1941?

A. The words "were issued" puzzle me. I do not know quite what you mean.

Q. From the warehouses?

A. How much was taken out of warehouses and how much put in?

Q. Yes.

A. No, I have no record of that.

Q. Have you ever made a calculation of the average turnover of materials and supplies?

A. No, I have not made any such analysis.

Q. It is important to know that, isn't it?

A. Yes, and our operating men certainly would know it. Our operating men in Kansas City would have full cognizance of those facts.

Q. Do your working papers show that?

A. No; my working papers show three things: first, the amount of materials and supplies now warehoused plus amounts of additional materials and supplies which are or were, at the time of this report, already ordered.

Second, it shows those two categories plus additional [fol. 4721] amounts which our operating heads expected to put on order within a very short period, namely, three months from that approximate July 1 date; and, third, it shows those combined categories plus additional materials and supplies which our management expected and intended to put on order after a three months date.

I classified it in that way so that our materials and supplies problem could be fairly and intelligently presented here for purposes of this hearing.

Q. Did you have any discussion with your operating men with respect to the average turnover of materials and supplies?

A. No, but I had extensive conversations with each department operating head as to the classification of these orders, the situation in which they found themselves as to immediate supplies, and the need for the additional supplies. I had our operating heads catalog in detail, item by item, what they had on hand, what they needed and when they needed it. All of those reports, Mr. Littman, were embodied in my working papers, to which you have had access in the last three months.

Q. And the total of $635,000 is merely the addition of those figures?

A. That is correct.

Q. Without any deductions of any kind?

A. Without any deductions, that is correct.

[fol. 4722] Q. Of any kind?

A. In other words, I have not edited those figures, I have depended upon the department heads knowing what

they wanted and why they wanted it. The figures, however, have been edited and inspected and refined by the operating heads of our business, namely, Mr. Neuner, our vice-president, and Mr. Creveling, our president, so that they represent far more than just estimates. They are intelligent appraisals carefully checked as to our requirements.

Q. Well, now, the amount of materials and supplies on hand as of June 30, 1941, amounted to $261,086, did it not?

A. And 61 cents, yes, sir.

Q. Suppose we omit the pennies.

And the amount of materials and supplies which were on order as of June 30, 1941, amounted to $105,004. Is that right?

A. That is correct.

Q. Which gives the total that appears on Table II in line 1 of $366,090. Is that right?

Mr. Wheat: You mean column 1?

Mr. Littman: Yes.

The Witness: Yes, that is correct.

By Mr. Littman:

Q. Now, the amount of materials and supplies in addition thereto, which it is expected will be ordered within 90 [fol. 4723] days after June 30, 1941, amounted to $131,064, did it not? A. That is correct.

Q. You show merely the cumulative total in column 2 on Table II of Exhibit 74, do you not?

A. $497,154.

Q. And to that amount you added the sum of $138,275 of materials and supplies which you claim is expected to be ordered after the 90-day period. Is that right?

A. That is correct. I understand that amount to be $138,145. Is that what you said?

Q. I said $138,275, but it does not make a great deal of difference. I believe the correct arithmetic would be $138,324. I think that would be more correct. Is that right?

A. That varies about $200 from my figure here, but I think it is inconsequential.

Q. Giving the total that you have in column 3 of $635,479.26? A. That is correct.

Q. And that total was arrived at by the pure addition of the figures you received from the various departments?

A. That is right.

Q. It is clear from your testimony, is it not, Mr. Sperry, that you did not deduct anything for future issues of materials and supplies?

A. There, again, I am a little bit vague as to what you mean by "future issues."

[fol. 4724] Now, you have testified that there were no deductions made from any of these amounts that were submitted to you by the department heads. Did you not?

A. Yes. In other words, these figures totaling $635,000 would be the amount of materials and supplies as of July 1, or approximately July 1, 1941, with all of these supplies to be ordered, delivered, and on hand as of that date.

Q. Without any deductions?

A. Without any deductions. Naturally, Mr. Littman, if a valve is withdrawn from a warehouse to be put into the line and comes out of materials and supplies inventory, it would immediately be put on reorder and replaced just as soon as it was taken out.

Q. Well, you have all of the materials and supplies included in your total which were on hand at June 30, 1941, and which were on order for at least 90 days in advance of that time.

A. And more than 90 days.

Q. Approximately how far into the future?

A. My $635,000 figure represents not only the materials on hand as of July 1 but the materials and supplies that we purposed to have on hand over several months following, all of which, however, constitute materials and sup-[fol. 4725] plies which we felt it would be desirable to have as of July 1, first, in the light of our reasonable expectancy of business.

Q. Well, now, you have a 90-day period that you mentioned a few minutes ago from June 30, 1941? A. Yes.

Q. And then you have orders to be made after the 90-day period? A. Yes.

Q. Now, what I would like to know is how far after the 90-day period does that extend.

A. I cannot give you that in days or weeks, but it was a period not long after the 90-day period, maybe an additional three or four months, two or three months. It was not, in other words, in the indefinite future. It was something that we contemplated doing as soon as we could turn ourselves to do it.

Q. Can we say, then, for all practical purposes it would be approximately six months from June 30, 1941?

A. Yes, not to exceed that.

Q. Yes. Then, this does not represent an average inventory, does it?

A. No, it represents the kind of inventory we would like as of today or as of three months ago.

Q. Of course, over a six months period there is a considerable amount of materials and supplies that are used up. [fol. 4726] Is that correct?

A. Yes, which materials and supplies would be immediately replaced. In other words, this represents the kind of a static inventory which we would like to maintain under present business conditions. We would not like to have to fall below the $635,000 inventory once we reach it.

Q. Well, of course, materials and supplies that are on order are not paid for until received?

A. No, but what we are asking for here is an allowance of working capital sufficient to pay for them as soon as they can be delivered. The reasons why we have not got them in our warehouses now are physical reasons and we either need those inventories or the money with which to pay for those inventories as soon as they can be delivered.

Trial Examiner: You might explain what you mean by "physical reasons", Mr. Sperry.

The Witness: The reasons have to do, Mr. Examiner, with priority orders, with the difficulties that obtain in getting physical materials and supplies from fabricators. In other words, manufacturing and delivery difficulties.

Trial Examiner: Related to the fact that the country it at war?

The Witness: Yes.

By Mr. Littman:

Q. Did you ask the men who submitted the figures of [fol. 4727] amounts on order whether they actually needed and required those materials as of June 30, 1941?

A. Yes. I asked them to give me a list of the materials and supplies, first, that they had on hand, second, that they urgently needed and that they would feel that it was dangerous, in view of the circumstances, to be without. These are the compilations of their answers.

Q. Well, there is always a certain amount of materials and supplies that is ordered ahead of time. Is there not?

A. They are all ordered in anticipation of need, except when there is a sudden break. We try to keep an inventory of parts that have to be replaced and except in cases where we have a sudden and unanticipated need we keep spares available.

Q. I do not believe you answered my question directly.

A. I am sorry. Let me have the question again.

(The pending question, as above recorded, was read by the reporter.)

The Witness: The answer is yes.

By Mr. Littman:

Q. And you think it is proper to simply add six months of orders, total them up and get the proper amount of inventory for purposes of this proceeding?

A. No, that is not what we have done. Let me explain. Around June 30 one factor began to emerge in connection with our materials and supplies problem and that was that [fol. 4728] we were going to have very great and increased difficulty in promptly getting materials and supplies, first, due to the fact that manufacturing facilities were slowing up due to war requirements; second, due to priority machinery, and that led to a study of material and supply requirements which we ought to have made previously but which we had not made previously. That resulted in bringing the whole question of our stock of replacements into sharp focus.

When it came into sharp focus, meetings were held between the various department heads and the operating management and we came to the conclusion that our policy, our heretofore policy of materials and supplies, had been

a very inadequate one, that there had been times when we were embarrassed because we had kept so small a set of replacements on hand, that we had been niggardly, and very niggardly, in stocking materials and supplies.

That policy of undue economy, I think, had been a hangover from the days when this company had inadequate working capital, when it did not have excess funds with which to properly stock its warehouses. That condition had been allowed to go on.

Q. When was that condition that you just described?

A. That condition prevailed in the years 1932 right through, maybe, 1937.

Q. How about 1931?

[fol. 4729] A. Well, undoubtedly then, but there probably wasn't as much need for materials and supplies at that time, because the property was in the course of construction.

Q. Well, they had more materials and supplies on hand, according to Exhibit 48, in 1931 and 1932 than in any other year subsequent thereto.

A. Well, maybe that was because it was in the course of construction, because the property was in the course of building at that time. I do not know about the classification, whether the parts were carried then in property or in materials and supplies. At any rate, the figures which we are talking about this morning are an outgrowth of two distinct facts which happened in June or July of this year, first, the fact that we were alarmed at being unable to get prompt deliveries, and, second, the fact that we did wake up to the fact that we did not have enough materials and supplies and had not had f[illegible] several years.

Q. In other words, the first factor that you named was simply this: That the company recognized that materials and supplies would probably be difficult to secure in the future and that, in view of that circumstance, it would be wise to accumulate a goodly supply for the future?

A. Yes, that was one reason.

Q. Now, let's look at this amount of working capital at the end of the six months' period, namely, as of December [fol. 4730] 31, 1941. Now, assuming that all of the materials and supplies that were ordered by your various departments were received prior to December 31, 1941, would you

have any such amount of materials and supplies on hand as that which you estimate in the amount of $635,000?

A. Yes. If the materials and supplies concerning which we have been talking had not only been ordered at this date but had been delivered and paid for, we would now have an item on our books of materials and supplies of approximately $635,000.

Q. Well, do you mean to say that there have not been any materials and supplies used up in the last six months?

A. Yes, but to the extent they have been used up, they have been reordered again and replaced, so that the $635,000 total would not be reduced.

Q. Well, have you checked into that?

A. Yes, I have, and I might say that the materials and supplies which I estimated would be on order within the next three months have all been ordered with the exception of those materials and supplies in that category for which we cannot get priority ratings, and that they are on their way to be delivered or else are delivered, and that a portion of the materials and supplies, which I estimated would be on order after September, are on order after September 1 and more are being ordered every day.

[fol. 4731] Q. You want a return in this rate case on materials that are on order and not yet received, do you not?

A. Yes, I want to have cash for the materials and supplies which we would have liked to have had and which we needed and which we should have had on June 30 in the present circumstances.

Q. And you want a return, also, on those materials that are on order that you know very well, due to priorities, will never be received?

A. No, I do not think we can adopt any such theory as that. I think we shall make strenuous efforts to get every bit of this stuff.

Q. But you know you are not going to be able to get all of it.

A. I think we are going to get a lot of it. Don't forget, Mr. Littman, that we are a defense industry and that the Government is cooperating with us to the utmost extent that it can to get these things. We have been beset with difficulties, but difficulties not on purpose on the part of the Government but difficulties arising out of red tape.

Q. Now, Mr. Sperry, your estimate was made as of June 30, 1941.

A. Approximately, yes.

Q. And six months since that time which was contemplated by your estimate have since expired?

[fol. 4732] A. Yes.

Q. And we now have some actual experience to look to and to compare with your estimate, have we not?

A. Yes.

Q. All right; now, what was the amount of materials and supplies on hand at June 30, 1941?

A. It is $261,086.

Q. I meant December 31, 1941.

A. I do not know. We have not any figures for the year-end yet.

Mr. Culton: I call Commission counsel's attention to the fact that on page 64 of the document he has examined, Prospectus of Panhandle Eastern Pipe Line Company, the figures for September 30, 1941, are shown as being $321,000.

By Mr. Littman:

Q. Is Mr. Culton's statement correct, Mr. Sperry?

A. I would have to look at your document to check it, Mr. Littman. What figure did you say?

Q. I think the document that you filed with the Securities and Exchange—

A. (Interposing) $321,277.

Q. Is that the amount of materials and supplies on hand as of September 30, 1941? A. Yes.

Q. Now, that leaves only three months to go to get up [fol. 4733] to $635,000?

A. Yes, sir, that is indicative of the very condition that we are worried about, that we won't be able to get deliveries as fast as we need them. That is why we are trying to be forehanded in accumulating materials and supplies to $635,000.

Trial Examiner: Some reference has now been made to some document filed with the Securities and Exchange Commission. For the purpose of clarity I think perhaps it should be identified.

Mr. Culton: I shall refer to the document, Mr. Examiner, as the prospectus of the Panhandle Eastern Pipe

Line Company in connection with its proposed $10,000,000 first mortgage and first lien bonds and 150,000 shares of cumulative preferred stock, which prospectus has recently been prepared by the Panhandle Eastern Pipe Line Company.

The Witness: I would like to have you mention that that is a red herring prospectus. Refer to the date because it isn't final.

Mr. Culton: The date being January blank, 1942.

The Witness: Draft number what?

Mr. Wheat: It is not on there.

The Witness: It is probably an original draft.

Mr. Wheat: It is clear that this has not yet been filed.

The Witness: It is not a final prospectus, that is why [fol. 4734] I want it read into the record that it is a red herring prospectus.

By Mr. Littman:

Q. Is the amount you refer to as working capital as of September 30 accurate? A. Yes.

Q. That is what we are referring to.

* * * * * * * *

[fol. 4735] Q. I take it that the amount of $635,479, estimated by you for materials and supplies, simply represents the amount that you think you would like to have on hand if you could get it?

A. That is the amount that, if we were absolutely free agents, we would have on hand today, that we would have had as of June 30 and that we will continue to have, based on our present expectancy of business. That is the approximate amount which we will continue to have in that particular inventory item from now on, as long as present conditions exist.

Q. You do not have it now?

A. No, we do not, but we either need that inventory or the money with which to purchase that inventory. That is why we are asking it as part of our rate base.

Q. It represents the amount which you would like to have?

A. It is the amount that we should have and that we are determined to have and will have just as soon as deliveries can be effected. It is the amount to which we are actually or potentially in the immediate future committed. In other words, it is the amount that we have on hand or on order, substantially, and which has got to be paid for.

[fol. 4736] Q. Do you at any time expect to have $635,000 of materials and supplies actually on hand?

A. Yes, I hope to have them in the not too distant future.

Q. Yes.

A. Just as soon as the factories can deliver them to us.

Q. I am not talking about on order, I mean all at one time on hand. A. That is correct.

Q. $635,000?

A. Yes, that is right. This is a $70,000,000 property, Mr. Littman, and potentially a larger property than that, and on a $70,000,000 basis, $635,000 of replacement parts does not loom very large.

Q. Well, did you make the determination or the conclusion that you had to have $635,000 worth of materials and supplies on hand?

A. No, sir, that was made by our operating organization, the men who were responsible for the operation of the property.

Q. They handed it to you and you accepted it?

A. They handed it to me, it was then put through two refining operations, both in general conference and in specific conference with Mr. Neuner, who was vice-president in charge of operations, and, again, with Mr. Creveling, [fol. 4737] who was president of the corporation. It was only after those refining processes that I used the figures.

Q. To what extent was the figure refined? Was it changed?

A. Yes, it was. I think this is a true statement: Our operating heads found that it was advisable to cut down in many cases some of the materials and supplies which the operating department heads felt they needed. The figures which emerged and which I have used represent a downward revision from the original figures as produced by the operating department heads.

Q. Well, the amount that they felt they needed was, of course, over a six-month period, was it not?

A. That was not the basis. The basis was what they needed at the present time in the light of all the circumstances.

Q. Mr. Sperry, how can you say that all of this was needed by them at one time when a substantial part of it was not to be ordered until after 90 days had elapsed?

A. I said in the light of the present circumstances, Mr. Littman.

Q. Well, now, who decided to conclude that it was all needed at one time, you or someone else?

A. I think my testimony is clear on that point. If we could have this $635,000 item housed in our warehouse to-
[fol. 4738] day and paid for, that would be the ideal situation, and that is the situation which we would like to have.

Q. That who would like to have?

A. The operating management of Panhandle Eastern Pipe Line Company, the president, the vice-president, and the other operating heads.

Q. Well, how about the operating men from whom you secured your information in the first place? How do they feel about that?

A. They would like even more.

Q. Well, they certainly have not ordered $183,000 worth of these materials and supplies. They had not even ordered those materials and supplies as of June 30, 1941, had they?

A. $105,000 had been ordered at the time that I made this study. $131,000, approximately, have been since ordered, and some part,—I don't know how much,—of $138,000 in addition to that are already on order.

Q. Well, now, the $138,000 was not ordered until 90 days had elapsed from June 30, 1941?

A. Yes, it takes time to do some of these things.

Q. And isn't that pretty good evidence that the men who waited 90 days before placing the orders didn't feel that they needed them immediately?

A. No, not at all. It takes time to shop around for
[fol. 4739] these things and to specify them. We do not take the first catalog that appears on the desk and order carte blanche. We analyze the market, find where we can buy to the best advantage and put things on order. Furth-

ermore, some parts have to be engineered and specifications have to be drawn up, so that it takes time to put materials and supplies of this volume on order.

Q. Well, who told you that?

A. Why, I just know it, I don't believe anyone told me that.

Q. No one told you that, none of these operating men told you that, did they? A. Not that I know of.

Q. They didn't tell you why they weren't going to place the order until three months to six months had elapsed from June 30, 1941, did they?

A. No, I don't think they had to, Mr. Littman.

Q. And that wouldn't indicate to you at all, would it, that they didn't need that material immediately, you say?

A. No, I will stick to my original testimony, that the company felt and it still feels that it is desirable, that it is sound to have $635,000 worth of this type of inventory in the light of all the present circumstances that face us and that we would like it in the warehouse now.

Q. You would like it in the rate base, too?

[fol. 4740] A. We want it in the rate base, because it has to be either in the warehouse or funds have to be available to pay for it.

Q. Can you testify, Mr. Sperry, of your own knowledge, that the operating men want all of these materials and supplies, or wanted them all as of June 30, 1941?

A. I can if I can believe the English language.

Q. Well, why do you wait?

A. It certainly was the approach that we took and it was the testimony that these operating heads gave me, and you can see that that is all recited in quite some detail and worked out, item by item, carefully, in the work sheets to which you have had access.

Q. Well, why then did the operating men wait from three to six months before they even placed their orders, if you know of your own personal knowledge?

A. Because in some cases you just can't place orders sooner than that.

Q. Well, do you know the facts or are you testifying generally about what you generally think?

A. This is general knowledge.

Mr. Culton: I would suggest that Mr. Creveling identified all these and he is available for cross-examination as to the three-month period and the six-month period.

By Mr. Littman:

[fol. 4741] Q. Who decides in the first place what materials and supplies are needed? A. Who decides?

Q. Yes.

A. The operating management, Mr. Creveling and Mr. Neuner, will decide on policy. The operating department heads would requisition those materials and supplies as it appeared that they were desirable and those requisitions would be passed upon by the top men before the Purchasing Department got the order.

Q. Well, who places the order first?

A. The initiative on materials and supplies comes from the field men when they use up a part or when they see the need for a part.

[fol. 4742] That goes through the operating department head. It would go through D. K. Stephens of the pipe line department, George Koch of the compressor department, Sam Taylor of the automotive department and Mr. McEllhatten of the communications department.

They would then approve or disapprove of the need and would go to the operating head of the company, Mr. Neuner, and obtain his consent to the order of those substantial purchases.

Then the matter would be referred to the purchasing department, who would place the order after shopping around the market, so you see it is quite some machinery, and it takes time, and we pride ourselves that we do an expert job of purchasing after full investigation of what the market offers.

Q. And you don't know what was in the minds of the operating men that initiated these orders, do you?

A. All I can say is that they indicated the need. I have full confidence in their judgment on it.

Q. They indicated the need over a six-month period, did they not?

A. They indicated that that is what they would like.

Q. And they placed some orders immediately as you have set them forth, did they not?

A. Yes, and scheduled other orders for just as soon as the machine could function.

Q. And they told you that they weren't going to order [fol. 4743] $131,000 worth of these materials and supplies until three months after June 30, 1941, is that correct?

Mr. Wheat: Mr. Littman, do you really mean what you said? That they weren't going to order it until three months? I read it that it was to be ordered within three months, and I wondered what you meant.

Mr. Littman: That is right.

Mr. Wheat: I am glad you corrected that.

By Mr. Littman:

Q. I will withdraw my question.

(Continuing) And it is a fact, is it not, Mr. Sperry, that the operating men at June 30, 1941, had not placed any order for the $131,063 worth of materials and supplies, but stated that they would probably order them within the 90 days ensuing, is that correct?

A. They didn't say they probably would, they said that they would proceed to.

Q. Proceed to? A. Yes.

Q. From time to time throughout the 90 days, is that right?

A. And if you carefully went over the work sheets during the last three months, you will note that these lists of materials and supplies comprise literally thousands of different types and kinds of items, and that if each one [fol. 4744] of these were ordered through the ordinary purchasing department, it would take months simply to specify and put them on order.

Q. Well, the fact is, they didn't contemplate ordering them except during the 90 day period? I am speaking of $131,000 worth.

A. We contemplated ordering them just as fast as the machinery could function. If they could all have been ordered on one day and properly specified and properly checked as to markets, that would have been done, but these things take time.

Q. Well, are you telling us what the operating men told you?

A. No, I am telling you what I believe to be the case.

Q. And the operating men in submitting their estimate to you advised you that they were not going to order $138,000 worth of these materials and supplies until after 90 days had elapsed from June 30, 1941, is that correct?

A. That is right. In other words, there are different degrees of imminence here in the deliveries, but all the deliveries are contemplated.

Q. And after 90 days had elapsed from June 30, 1941, of course, there were certain materials and supplies that had been taken out, had there not?

A. Yes, which were, in turn, ordered for replacement.

Q. And used up?

A. Yes, which were, in turn, ordered for replacement in [fol. 4745] addition to these amounts.

Q. You would like to have a return on those, wouldn't you?

A. No, I would like to have a return on the aggregate of $635,000.

Q. Although not on hand?

A. That is right but on order.

Q. Yes, and although not delivered?

A. That is correct.

Q. And although not on the shelves of your company?

A. That is correct, that is the provision that I want to have. I want either cash or the materials and supplies to that amount.

Q. In other words, you want $105,000 worth of materials and supplies that have been on order, you want $131,000 worth of materials and supplies that were to be ordered within 90 days from June 30, 1941, and you want $138,324 of materials and supplies to be ordered after 90 days from January 30, 1941, a total of—

A. (Interposing) $374,392.

Q. Now, is my statement correct?

A. That is correct.

Q. Now, you have included in your estimate the sum of $34,000 for "line pack" shown in Table III of Exhibit 74, Item 6?

[fol. 4746] A. That is correct.

Q. Upon what theory are you claiming $34,000 for line pack?

A. Mr. Littman, please don't try to get me in trouble on the technical aspects of line pack, because I am not an

engineer. I depend entirely upon the report of Mr. Burnham to whom I addressed the question, and whose working papers I think you still have, because they have never been returned to me.

The ordinary company has an inventory which is a legitimate part of working capital. It so happens that the inventory in the case of Panhandle Eastern Pipe Line Company is the gas in its line, which costs money to produce and which the company will never be able to sell because if the company goes out of business, that line pack will stay in the line and will not be marketed.

It, therefore, is an item of inventory, if you please, that has some value and you and I might quarrel considerably about what that value is, but it has some value, and we believe that we are entitled to include that value in our working capital, just as a merchandising company might include its inventory in its working capital.

Now, I don't profess to know what that gas is worth. We tried several formulas trying to set it up and establish it on a fair basis. We found a great deal of difference of [fol. 4747] opinion in our company as to what we should call the worth and I might add that the final figure which I used, which I use on my own responsibility, is a very much more conservative opinion than was recommended to me to be used by others in our company, because they thought the gas was worth more for this purpose than I did.

Q. Mow many M. c. f.'s of gas did you use for purposes of this estimate?

A. As I say, I can't give you any information on that line pack unless you give me back my working papers.

Q. I am sorry. I thought you had received that.

A. No, you still have them. They were given to you supplemental to this package, they were prepared by Mr. Burnham and given to me in a separate package, and I have given them to you, and I have never had them back. I think I have a summary here of what I did. I may have my memorandum to Mr. Burnham and a summary of his reply. Let me just see if I have.

Q. Do you have the figure in your papers of—

A. (Interposing) $34,000.

Q. Do you have a figure of $841,578 M. c. f.'s—

A. (Interposing) Wait a minute, I will tell you what I do have. I have a resume of pipe line storage studies from March 1, 1941, to July 31, 1941, showing that we have in storage in our line a total of 956,830,000 cubic feet of [fol. 4748] 14.73 ounce gas.

Q. On Page 470 of the transcript, you testified that the line pack amounted to approximately 851,578 M. c. f.?

A. Yes.

Q. On a 16.4 pound pressure base? A. Yes.

Q. And that you calculated your allowance at the rate of 4 cents? A. At the well head.

Q. Per M. c. f. at the well head, making an inventory value of $34,063, is that correct?

A. That is correct.

Q. And you rounded that sum off to $34,000 for line pack? A. That is right.

Q. The thing I would like to know is whether this 851,578 M. c. f. of gas represents the total line pack for all the lines?

A. Yes, I think that that is the capacity of our system at any one given moment.

. . . . . .

By Mr. Littman:

[fol. 4749] Q. Mr. Sperry, the amount of $34,000 for line pack included in your estimate of working capital represents the value of the gas which is packed in all of Panhandle Eastern's lines, is that right?

A. That is my understanding.

Q. Do you know whether the plant accounts of the company contain $70,108 for gas used in testing and packing the lines in the initial test in 1931?

A. No, I am not familiar with that.

Q. Well, do you know whether or not the company has capitalized on its books the value of gas used in testing and packing the lines?

A. I made some inquiries on that subject in the course of preparing my report on proposed working capital requirements. My recollection at the present is that some of the line pack was capitalized either in 1931 or in 1932 at a time, however, when our capacity was very small compared with the present, both because of the reduced

pressures at which we were then operating with relation to our present pressures and with relation also to the cubic capacity of the line, and I felt that, in making my appraisal here of $34,000 which represents a 4-cent price on the present line pack, that I had more than enough compensated for any small capitalizing that might have been done there by taking such a low figure of value, and I am not at all [fol. 4750] sure that there was anything capitalized at that time.

Q. You would not call a figure such as $70,108 which, according to our information, was capitalized for testing and packing the line in 1931, a small amount, would you?

A. I would say, without knowing that particular item, Mr. Littman, I would say that that particular expense to which you refer was probably for initially purging the line, cleaning it, when the line was originally built, in which case it is quite a different thing from the inventory line pack to which I have been referring.

The inventory line pack to which I am referring is the static amount of gas which is always in our line by reason of the fact that when you deliver gas you have got to put new gas in one end and take out at the other, and you have got to push the gas that is in the line through.

Q. Isn't that done in the purging operation?

A. No, purging is simply cleaning the line, blowing gas through and letting it come out at the other end into the open air, and cleaning out dust and particles of that kind.

Q. What do they then do?

A. That gas is gone.

Q. The gas that was used in purging is gone?

A. Yes.

Q. But the gas that immediately follows it?

[fol. 4751] A. That is part of this static amount of line pack.

Q. Yes.

A. But if you purge a line, you put some gas in one end and pull it out at the other, and it is gone out into the open air. That is an item of expense. That is not an inventory item at all. It does not affect the inventory.

Q. Now, referring to the amount of gas that immediately follows purging; the gas and which is left in the

lines immediately after the purging operation, did you inquire whether or not the value of that gas was capitalized as well as the value of the gas that went out into the air in the purging operation?

A. I made no inquiry at all about purging operations, because that is an item of expense that does not enter into this question at all.

I did make some inquiry as to whether any of the initial line pack which stayed in the line when it was originally built or up to the end of 1931, was capitalized, and my recollections are a little vague on the subject now, but I know that I did explore it and felt that the inclusion of this $34,000 item was a perfectly safe and conservative amount to include in working capital, whether the relatively smaller amount of gas had been capitalized or not in earlier years.

Q. Can you give us the amount that you refer to as a small amount?

[fol. 4752] A. No, I cannot. As I say, my recollections on that point now are vague. I crossed the bridge, but I cannot give you the facts, as I found them, at this moment.

Q. Well, to the extent that the company has included in its plant accounts the value of gas used in packing the line, to that extent, at least, you have made a duplication; have you not?

A. If there is any amount in some other place in our proposed rate base which represents line pack, then it should not be duplicated here, but my recollection is I crossed that bridge rather adequately and found that there was not.

Q. When you made this working capital estimate, Mr. Sperry, you were making it primarily in conjunction with Mr. Biddison's reproduction cost estimate, were you not?

A. I checked with Mr. Biddison on every phase of my study after I had made it and had the accounting department and Mr. Biddison's men both check to see whether there was any duplication or overlapping between my base and his, and I found that there was no such duplication, and the accounting department so certified to me.

Q. There would not be any duplication, of course, where this amount that you estimated is added to a reproduction cost estimate, would there? There could not be

any duplication there, because Mr. Biddison does not have any such item in his reproduction cost estimate, does he? [fol. 4753] A. I do not know. I am frank to say I cannot testify about Mr. Biddison's material.

Q. Well, your inquiry as to duplication, Mr. Sperry, was directed toward determining whether or not there was any duplication as between your estimate and Mr. Biddison's estimate, is that correct?

A. No, I will tell you how I approached it. These materials and supplies we have been working on, I made sure that I had nothing in materials and supplies that he may have had in property account.

Q. By "he", you mean whom?

A. Mr. Biddison might have in the property account, because in some cases, for instance, on lengths of pipe, we might be carrying some extra pipe as materials and supplies and some extra pipe as property account, and those matters I explored and made certain that there were no parts carried in materials and supplies which were carried in property account.

I also ascertained to my satisfaction that this line pack item which I was including in my working capital allowance was not provided for or duplicated in any of Mr. Biddison's base, so that while I cannot certify to you the details of that, I am quite sure of my ground.

Q. Do you mean—

A. (Interposing) I cannot tell you, for instance, what accounting might have taken place as regards line pack [fol. 4754] in the past, but I am certain that I am not wrongfully including it here.

Q. Now, if the Commission were to adopt an original cost or book cost rate base, it would be very important, would it not, to see that there is no duplication of line pack as between your estimate and the amount included for that purpose on the books of the company?

A. Yes, that, I would think, would be proper.

Q. And you are not sure whether there is or is not any duplication?

A. I have testified I do not believe there is, Mr. Littman, but I am also testifying that I cannot give you page and verse of how I explored that, or to what extent there may have been accounting entries in the past.

Q. In other words, you do not know of your own knowledge whether there is or is not a duplication?

A. I cannot swear here on the stand that some of the line pack has not been capitalized in the past. I do not know whether it has or not at this moment, but I remember carefully canvassing that at the time and feeling that it was perfectly proper for me to include this item here.

Q. Do you recall whether or not there was mentioned in connection with your canvass a figure of $70,108 which appears in the plant accounts of the company for gas used in testing and packing the line?

[fol. 4755] A. No, I am quite sure that no such figure was ever discussed with me, and I also lean to the feeling that that probably is a purging operation and a matter of expense which is quite different from the line pack which finally emerged.

Q. I am talking about the item of $70,108 which is charged to plant account. A. Yes.

Q. Not expense, Mr. Sperry.

A. That is right, but isn't that an item before 1932?

Q. It is an item that was incurred during construction in 1931, according to our information.

A. Haven't we heard somewhere in this case that a good deal of expense was capitalized in 1931 or 1932?

Mr. Culton: March 1932, I think the testimony shows, the company capitalized everything as of that date. It is the testimony of Mr. Watkins.

The Witness: If that were expense of purging the line at that time and was then capitalized, it would not bear upon the subsequent line pack at all, you see.

It would be a matter of expense that had been capitalized, not a matter of setting up a value for inventory.

By Mr. Littman:

Q. If the book figures of cost were to be used for a rate base for purposes of this proceeding, the cost of [fol. 4756] packing the lines should not be included there, and also included in your estimate, should it?

A. Unless the line pack is materially greater now than it was when the original line pack was capitalized. If we say 200 million cubic feet was capitalized in 1931 as the then capacity of the line and if now our capacity and our

line pack is 851 million, then it would be perfectly proper to ask for an allowance now on the difference between the 200 million then capitalized and the 851 million now to be capitalized.

Q. On the difference, but not to make a duplication?

A. Yes.

Q. Now, Mr. Sperry, do you know what the company's practice has been with respect to charging the cost of packing the new lines and lines built subsequent to 1931?

A. No, I do not know that we have any practice of capitalizing them. I do not think we have. I do not think that it appears on our books as an item. I am not sure. I know that when we buy gas for our own use, that we charge ourselves with it at a very much higher rate than I have put in here.

Q. Isn't it a fact, Mr. Sperry, that the company's annual financial statements show a separate item of line pack in plant account?

A. I cannot answer that question at this moment.

Trial Examiner: May I ask, Mr. Littman, whether the [fol. 4757] System of Accounts indicates the propriety of the inclusion of this item as working capital? I think we have a question of some interest here as to whether such an item should be a part of capital or plant account, or a part of working capital.

Mr. Wheat: That is true, your Honor. Doubtless, it is a technical matter.

Trial Examiner: And it seems a good time to ascertain the views of counsel with reference to it.

Mr. Littman: I understand that our Uniform System of Accounts does not have a separate subject such as working capital. Working capital is made for rate making purposes from the balance sheet accounts by grouping a number of items such as materials and supplies and so forth, and so I believe that our System of Accounts is silent on that subject.

Mr. Wheat: I do want to say, Mr. Examiner, that in the Natural Gase Pipe Line Company of America case, the company's evidence on working capital did include a sum for packing gas in the line, and that this, as I understand

the decision, was accepted by the Commission for the purpose of its order in that proceeding.

Mr. Lee: Did or did not include?

Mr. Wheat: Did include it, yes, Mr. Lee.

I also understand that in the Canadian River Case which is now pending awaiting decision, Commission's counsel made a similar suggestion to that which Mr. Littman is [fol. 4758] now apparently suggesting to the witness, that if gas in the line had previously been capitalized, then it should not be separately and in a duplicate manner allowed as a part of working capital.

I would think, Mr. Examiner, that the exploration of whether this is in the account in any part, particularly in the item mentioned by Mr. Littman, would be a proper field of examination of Mr. Watkins.

It is obvious that Mr. Sperry is not informed in respect to this particular matter of the accounting for the original gas that went into the line. I am wondering whether that would not be the case.

Of course, it is also obvious, Mr. Examiner, that the capacity of the line has been so greatly increased since 1931, that any capitalization on any fair basis of line pack at that time would be obviously inadequate with respect to the present plant of the Panhandle Eastern Pipe Line Company.

Mr. Littman: Well, the point we are seeking to develop here, if your Honor please, does not deal with the propriety of including an amount in working capital or elsewhere in the rate base for line pack.

I wanted to make certain, however, that there be called to the attention of this witness and the company the situation that it is our understanding that the company has from time to time, not only in 1931 but subsequently thereto, capitalized on its books in the plant accounts the value of [fol. 4759] gas used for not only purging the line, but also packing, as well as purging the line.

Mr. Wheat: Mr. Littman, may I make this statement: We will stipulate on behalf of Panhandle Eastern Pipe

Line Company, there should be no duplication of such an item, and I will also state, Mr. Examiner, that we will endeavor to ascertain the fact in more detail than Mr. Sperry is now prepared to testify on this particular matter.

Mr. Littman: I understand that Mr. Sperry's estimate was primarily made for the purpose of going along with Mr. Biddison's reproduction cost estimate, in which event there would be no duplication but, inasmuch as the Trial Examiner has indicated that the rate base to be used in this case will be other than reproduction cost, we are, of course, very anxious that there be no duplication, and I can see that this witness is not familiar with the accounting practice and I, therefore, shall defer this line of inquiry.

Mr. Wheat: Irrespective, Mr. Examiner, of any potential rate base, we will undertake to develop the facts in this regard.

Trial Examiner: That, of course, is proper and the thought the Trial Examiner had in suggesting the question was to ascertain whether counsel are in agreement that the cost of, or investment in the packing of the line is properly included as an item of working capital.

[fol. 4760] Mr. Littman: If you Honor please, we are willing to agree that the item of line pack is a proper item to be included in the rate base for rate making purposes. A proper amount for line pack, of course, represents an investment that is frozen in the business and without which the business cannot operate and so, our line of inquiry was not at all directed toward the establishing that the item itself was improper, but it went rather to the matter of accounting duplication.

Have we made ourselves clear?

Trial Examiner: You are apparently then in agreement that this is properly under consideration as an item of working capital?

Mr. Littman: As an item of working capital or as an item of plant account.

Mr. Culton: May I suggest in this connection that the amount which you referred to as having been used in 1932 or spent in 1931 is not computed on a 4-cent basis.

That was at a time when the price of gas was much higher than 4 cents. I think your investigation clearly shows that they did not use the price which has here been used for that gas. Most of that gas was gas purchased at much higher prices.

Mr. Wheat: In any event, Mr. Littman, we will attempt to ascertain the fact in that regard and offer that.

Mr. Littman: I did want to make this clear to your [fol. 4761] Honor, that line pack may properly be a part of working capital, provided, however, that it is not included elsewhere in the plant accounts of the company and duplicated.

Mr. Wheat: We will stipulate to that.

Trial Examiner: This last statement brings you completely in accord as to the propriety of considering it as a part of working capital, leaving only the amount to be determined and one question which has just arisen in connection with the determination of the amount apparently is related to the pressure.

Mr. Culton: The pressure and the other element of capacity.

Mr. Wheat: And the price of the gas.

Trial Examiner: The pressure and also the price of the gas. I do not know to what extent that has been covered in the record, but I assume that the pressure which has been stated is in accordance with commercial custom and practice. If it is not so, I assume also it will come up in further examination.

Mr. Culton: For the Examiner's information, when the line was first constructed, there was very little pressure in it, and naturally, very little gas.

For example, the gas ran from the Panhandle Field to the compressor station at Liberal under the well pressure, which shows that very little volumes of gas were being car- [fol. 4762] ried in the line at that time.

Later, as the pressures were stepped up and as the size of the pipe line increased, of course very great increases

of volumes in gas necessary for line pack occurred, so that the line pack in 1931 and 1932 was a small percentage of the line pack which the company has at this time.

By Mr. Littman:

Q. Mr. Sperry, will you please turn to Table 4 of your Exhibit 74?

In that table, you show "Total Cash, Pre-Payments, and Materials and Supplies Actually Maintained by the Company at Certain dates in the Past."

These figures are shown from June 30, 1937, through June 30, 1941, at various dates.

Mr. Culton: And also December.

The Witness: At half-year intervals all the way through.

Mr. Littman: I see.

By Mr. Littman:

Q. Now, in your direct testimony, you referred to these amounts as "aggregate actual working capital."

What do you mean by that?

A. They represent the same items of working capital for which we have asked allowance in our tables. In other words, this table, No. 4, indicates that while we have asked for an allowance of $1,569,000, I believe it is, for working [fol. 4763] capital allowance, in this rate base, that we have also kept at these periods specified, total cash, prepayments, materials and supplies substantially in excess of those amounts which we have asked to have included in our present rate base.

Q. What conclusion do you wish to be drawn from that?

A. I wish to conclude that the allowances which we have requested are conservative; that they are low in proportion to what we have felt in the past we have actually needed for those purposes.

Q. Do you think it is proper to draw any such conclusion as that?

A. Yes.

Q. From these figures?

A. Yes, I do.

Q. Mr. Sperry, these huge sums that you show on Table 4 are simply the total of the company's cash on hand and materials and supplies on hand and pre-payments, are they not?

A. That is correct.

Q. And the bulk of these figures simply represent cash on hand, do they not?

A. The cash on hand is the largest item in these figures but, Mr. Littman, this is a good example of our deep conviction that in order to maintain the credit of this company and to keep our avenues of raising funds open, that [fol. 4764] especially in the light of the fact that we are dynamic and going, we need large sums of working capital on hand at all times and we have felt that it was necessary to leave large sums of working capital on hand at all times for that purpose.

Q. Now, these sums that you have shown in Table 4 are not working capital at all, are they, Mr. Sperry?

A. Yes, they constitute items of working capital.

Q. Do you know what the definition of actual net working capital is?

A. We have not been talking about net working capital. We have been talking about working capital for rate making purposes, working capital allowances.

Q. Do you suggest that these amounts you have in Table 4 have anything to do with working capital for rate making purposes?

A. They are exactly the same three items as constitute the bulk of our requests for allowance for working capital, in other words, simply the cash, pre-payments and materials and supplies.

They do not, for instance, include other items of working capital which we have on our books, such as accounts receivable which are not part of this case.

Q. Well, according to this table then, the more cash you have on hand, the more working capital you are entitled to, is that it?

[fol. 4765] A. Not at all, but I think this is a splendid example of how important the company thinks it is to have an adequate supply of cash and materials and supplies on hand and if we do not have such adequate amounts

of cash and materials and supplies on hand, we think our credit would suffer.

We think it would be impossible for us to render the service that the public is entitled to from our property.

Q. You have not made any deductions from these figures for current liabilities, have you?

A. No, sir, these items do not purport to be a complete list of all the items which appear on a company's current assets and current liabilities account.

They purport to be simply the total of the three items which constitute the bulk of the allowance which we have petitioned for inclusion in our rate base as working capital items.

Q. They are simply the total of current assets without the accounts receivable, aren't they? That is all they amount to?

A. They are an incomplete recital of both current assets and current liabilities, but they are an indication that we feel it is necessary to keep ourselves in a strong current position.

Q. Maybe it indicates that to you, Mr. Sperry, but isn't it a fact that men who work with figures such as these [fol. 4766] use the figure which is called "actual net working capital", do they not?

A. Yes, and that, of course, is a subject which we have not discussed at all in this hearing, have we?

Q. No, we have not, and if we are going to make any comparison between the amounts which you have suggested be allowed here, don't you think it would be proper or more proper, rather, to compare it with the actual net working capital, instead of the so-called aggregate actual working capital?

A. Well, let's not go beyond the point which I testified to, namely, that this is given simply as an indication of our feeling that it is necessary for us to keep ourselves in a strong liquid position.

Q. Can you tell us what actual net working capital means? What is actual net working capital?

A. What is what?

Q. Actual net working capital.

A. Current assets, minus current liabilities.

Q. And that is an accepted, recognized term and definition, isn't it?

A. I think that is conventional, yes.

Q. Will you determine the actual net working capital for 1940 from the company's balance sheet, Exhibit No. 48?

A. According to this classification which I assume is correct, total current and accrued assets of the company [fol. 4767] as of the end of 1940 were $5,491,000 rounded out and the total current and accrued liabilities were $3,171,000 rounded out.

Q. That leaves what amount?

A. That leaves about $2,320,000 as net working capital.

Q. Now, the $5,491,136 which you read into the record a moment ago as representing for the year 1940 the company's assets contains how much cash?

A. $3,744,000.

Q. Now, what amount did you claim is required by way of cash working capital?

A. For purposes of what?

Q. Cash working capital.

A. For inclusion in a rate base?

Q. Yes.

A. We have made request, I think, for somewhat around $900,000.

Q. $900,000, that is right. That is our understanding of the total of the first four items on your Table 3.

A. Which we think is a very conservative request.

Q. Now, will you please substitute for me the $900,000 in place of the $3,744,000 of cash that the company actually had on hand at the end of the year 1940, and tell me what the actual net working capital would be on that basis?

A. I do not see that that is relevant at all.

Q. Whether it is relevant or not, would you mind tell- [fol. 4768] ing me?

A. Perhaps you would like to make the subtraction. It is a matter of subtracting $2,600,000 from the net working capital which I outlined a minute ago.

Q. Well, using your $900,000 cash figure in place of the actual cash figure of the company for 1940 and making the calculation of actual net working capital on that basis, what would the result be?

A. The result, as I see it, would be a working capital deficit.

Q. It would be zero, wouldn't it?

A. It would be worse than that, it would be a deficit.

Q. It would be a minus or negative working capital, wouldn't it?

A. Yes, it would be a working capital deficit, we call it.

Q. In other words, your creditors supply you with working capital, do they not?

A. Not at all. That does not follow.

. . . . . .

[fol. 4775] C. H. HINTON, resumed the stand, and testified further as follows:

Cross-Examination (Resumed).

By Mr. Littman:

Q. Mr. Hinton, did you prepare Exhibits Nos. 42 and 43 and the maps which have been identified as Exhibits 44, 45, and 46?

A. Yes, I prepared Exhibits 42 and 43, and did the preliminary work on the maps, but the rest of them were completed under my direction, that is the actual coloring of the maps.

Q. That is to say, all of these exhibits which I have just named were prepared by you or under your direction and supervision?

A. That is correct.

[fol. 4776] Q. Now, Exhibit 43 contains your written testimony from pages 4 to 41, inclusive, does it not?

A. Yes, sir.

Q. The present position which you occupy with Panhandle Eastern Pipeline Company is that of production engineer?

A. That is correct.

. . . . . .

Q. You had arrived at a number of conclusions in your Exhibits Nos. 42 and 43. In order that the record may be clear and in order that I may have you express an opinion as to whether my understanding of these general conclusions is correct, I would like to take up several of them

and inquire whether my judgment or understanding of these conclusions is correct. One of these conclusions, as I gathered, is that capital expenditures on the production and gathering system south and west of Liberal compressor station in the aggregate amount of $4,983,432 would be required over the next five and one-half years to the end of 1946 if Panhandle Eastern's load were not increased beyond the present annual demand. Is that correct?

A. That is correct to the extent that it is possible to prepare a correct estimate with the exception or with this to be included, that it is necessary to spend this amount to protect leases which will be lost to the company otherwise. [fol. 4777] Q. I gathered from your answer that generally my statement is a correct representation of one of your general conclusions?

A. Yes, sir.

Q. And am I correct, further, in gathering from your answer that not every dollar of this $4,983,423 is necessarily for the purpose of producing what you have referred to as the basic load?

A. That is correct, Mr. Littman. If we did not have to protect some of our leases and guard against the losing of the leases, why, it would not be necessary to spend that amount of money to maintain the production level to supply our present market, for the market as of the mid-year 1941.

Q. Now, of course, we are speaking of the Panhandle field, are we not?

A. No, we are speaking of the Panhandle and the Hugoton field.

Q. That is right, we are speaking of the production system. Now, some of the wells, whose cost of drilling you include among the capital additions or capital expenditures, to which I have referred, are wells that are to be drilled, not for the purpose of immediately securing gas, but for the purpose of maintaining the leases. Is that right?

A. That is correct; however, if we did not drill some of the wells on the acreage which is now top leased by others, [fol. 4778] it would be necessary to make further expenditures in the Hugoton field of Kansas in order to meet our present load.

Q. Now, without going into details at this time,—we will probably go into greater detail later,—can you give us an idea of approximately how much of the $4,983,423 of capital expenditures are required to be expended by reason of the maintenance of leases and such other matters as you have just mentioned as distinguished from those expenditures which must necessarily be made in your judgment for the purpose of securing the amount of gas contemplated to be produced for the basic load?

Do you understand my question?

A. I believe that I do, yes, sir.

That is approximately $1,494,000; for the five and a half year period we could keep from spending that money, but ultimately we would have to spend that amount anyway, so it is just a matter of putting off that expenditure.

Q. To put it another way, you are going to expend the amount of—

A. $1,494,000, or approximately.

Q. (Continuing) —in advance of actual need?

A. That is right.

Q. Now, the figure that you have just given includes, not only the wells, but also the gathering lines and other [fol. 4779] expenditures?

A. That is right, with the exception of the camp at Optima, Oklahoma. I did not include that in this figure here. I can.

Q. It would not be a very large amount, would it, Mr. Hinton?

A. No, it is small.

Q. Don't bother to give us an allocation.

Now, another general principle or conclusion that I gathered from your exhibit is that capital expenditures on the production and gathering system south and west of Liberal compressor station in the aggregate amount of $7,147,219 will be required over the next five and a half years to the end of 1946, in order to permit the company to deliver to its main pipe line the volumes of gas which Mr. Morton has estimated will be required during that same period, is that correct?

A. That is correct.

Q. Now, what part of the sum of $7,147,219 represents expenditures not immediately required for that purpose?

A. By "not immediately", do you mean within this five and one-half year period?

Q. Yes, I mean within the five and one-half year period, for the purpose of producing the amounts of gas contemplated by your so-called anticipated load.

[fol. 4780] A. In the event that we have no valid proration in Hugoton field, Kansas, the amount will be very nearly the same as the $7,147,219.

. . . . . .

Q. Will you please explain what you mean by "valid proration"?

A. I mean this, that if the development of Panhandle Eastern Pipe Line Company in the Hugoton field, Kansas, is not curtailed by a proration order, we will spend approximately this amount of money. In the event that we did have valid proration, why it would exceed this in all probability.

Q. Who would issue this proration order?

A. The State Corporation Commission of Kansas.

Q. How would that proration order affect the situation, Mr. Hinton?

A. Well, in order to explain that, I will probably have to explain how proration works in the State of Kansas.

. . . . . .

By Mr. Littman:

Q. Well, am I correct in understanding that the pro-
[fol. 4781] ration law of Kansas has a material bearing upon your exhibits? A. Oh, yes.

Q. Then, it would be wise, I think, to have you explain your understanding of the proration situation.

A. In December, 1938, the State Corporation Commission placed an order upon Hugoton field, Kansas,—

Q. You are speaking of the State Corporation Commission of Kansas?

A. Yes, sir, I believe I said that, did I not?

(Continuing) —and under this order it was necessary that every operator in that field be developed so that their participation in the total production of the field was equal

to their total development, that is, if the development of each company—

It will probably be easier to give an example. If Panhandle Eastern had development which gave them a 50 per cent participation in the Hugoton field, then they were entitled to 50 per cent of the total production from that field.

Q. Over what period? Annual periods?

A. Those, at that time, were monthly. It has now been changed to six months. The reason that this proration order has a very far-reaching effect upon the capital expenditures declared by Panhandle Eastern is that other [fol. 4782] companies can set the pattern for the field, that is, if it takes ten wells of average size to give an allowable of 5,000,000 feet and this company that is taking 5,000,000 feet, instead of having ten wells, has twenty wells, it means then that every other company that produces gas in that field must change their ratio of development to withdrawal to meet that twenty wells for 5,000,000 feet.

Q. Why, in order to avoid drainage?

A. No, it is just an order that everybody shall take from their wells the same amount, that is, for the same size well. Any producer that sets the pattern for that field can change the ratio of requirements there over a two or three months period, so that we might have to drill many more wells than we now have included in our plan.

If you will notice, we have very few wells in the Hugoton field, Kansas. Now, then, if that development shifts around in the Hugoton field so that a new pattern is set, why then we would have to drill wells that we don't contemplate drilling now to take the same amount of gas from Hugoton field, Kansas.

Q. In other words, a change in the proration would have the effect of increasing your capital expenditures?

A. Yes, sir, it could. I don't say that it would, but it readily could.

Q. And you have not made any estimate upon that [fol. 4783] contingency?

A. No, sir, that would be almost impossible to use on an estimating base and it has been ignored in this amount shown here.

Mr. Lee: Isn't the proration schedule under the law of Kansas a matter of litigation now?

The Witness: That is correct, it is.

Mr. Lee: And haven't some of the lower courts invalidated it?

The Witness: I am not sure about that, Mr. Lee.

Mr. Lee: Is it being enforced?

The Witness: No, sir.

Mr. Lee: So that all that you talk about is up in the air as far as enforcement is concerned, isn't it?

The Witness: It has just been before the District Court out there.

Mr. Lee: By injunction, wasn't it?

The Witness: And it is going back to the Commission for rehearing, or the State Supreme Court, and that will probably happen some time this month.

Mr. Lee: But the law that was passed,—you said in 1938?

The Witness: Yes, sir.

Mr. Lee: Has resulted in making it inoperative since 1938, hasn't it? That is the contest on the law?

[fol. 4784] The Witness: Well, it has been inoperative a great deal of the time, but there have been times in each period when it has been in effect.

Mr. Lee: But it hasn't been in effect in your own knowledge in the Hugoton field in Kansas? It would have to be practically in effect to be of any importance, because, isn't it true that litigation was started to enjoin the right from the time it became effective under the statute?

The Witness: That is correct, and it is now getting to the point that we are now likely to find out which way it might go within the next few months.

Mr. Lee: And if the Court invalidates it, then that matter of proration is out of the window until they pass another proration law, isn't it?

The Witness: I don't know how that works legally.

Mr. Lee: You know that the authority of the Commission in Kansas is predicated on that proration statute, don't you?

The Witness: Yes, sir, I do know that, but I don't know what effect any court decision might have on the future.

Mr. Lee: No, but I say the present law, if invalidated by the Supreme Court of Kansas will result in wiping out proration until some new statute is enacted and sustained, won't it?

The Witness: I believe that is the way it works, yes, sir.

* * * * * * * *

[fol. 4786] By Mr. Littman:

Q. Well, Mr. Hinton, I gather from your testimony that excluding from consideration the proration situation, $7,147,219 will all have to be expended in capital expendi-

[fol. 4787] tures over the next five and a half years, to the end of 1946, in order to permit the company to deliver to its main pipe line the volume of gas which Mr. Morton has estimated will be required during that same period?

A. I believe that this figure is very nearly correct. There are two wells which might be kept out of this, but which would probably cost us a little bit more from an operating standpoint if we did not drill on it. I refer to the two locations on the Canadian River bed which is a State lease, which does not expire.

Q. You might not have to drill those to secure this quantity of gas required for the anticipated load?

A. That is correct. That would be a matter of some $40,000.

Q. Mr. Hinton, you testified at page 32 of your Exhibit 42, referring to this so-called anticipated load, that, "but we know that larger volumes of gas will be required and that such increases, in large part, will be beyond the control of the company. To serve present markets and the anticipated increases, capital expenditure of a more realistic

figure will be required. To serve the existing markets, as well as anticipated increases, the capital expenditures required will be at least the sum of $7,147,219."

Is that correct?

A. As nearly as I am able to estimate, yes, sir.

[fol. 4788] Q. In other words, it is your testimony that the company will, in reality, be called upon to produce the amount of gas estimated by Mr. Morton, which you have referred to in your exhibit as the "anticipated load," is that correct?

A. Yes, sir.

Q. I take it, then, that the capital expenditures with respect to the so-called basic load, which does not contemplate any increases, are more or less of an academic question, are they not?

A. We used that, first, on our problem as a base and figured from that the increased cost.

Q. Based upon an assumption which you, in your own heart and mind, know will not be the situation in the next five and a half years?

A. To what assumption do you refer?

Q. Well, the assumption that I was referring to was the basic load. You know, don't you, that there will be no such thing as a basic load in the next five and a half years?

A. That has been proven for the period from June up to now, yes, sir. I don't know what it will be at the end of five and a half years, but I think that Mr. Morton's figures are going to be very close to what our load will reach.

[fol. 4789] Q. In other words, you are a disciple of Mr. Morton in that you are already making preparations to meet the increased demand which Mr. Morton has estimated will be made upon the system in the next five and a half years, is that correct?

A. Yes, sir.

Q. Now, another general conclusion that you reached was that the operation and maintenance expenses, which would be incurred in the Panhandle and Hugoton fields, in order to produce and deliver to the main pipe line at Liberal compressor station an amount of gas equivalent to the volumes now being produced over the next five and a

half years, would increase in those years in the total amounts shown in Schedule 3 of Exhibit 43. Is that a correct statement? A. Yes, sir.

Q. And am I correct in stating that a further conclusion that you reached is that operation and maintenance expenses which will be incurred in the Panhandle and Hugoton fields in order to produce and deliver to the main pipe line at Liberal compressor station the volumes of gas which Mr. Morton has estimated will be needed to fulfill Panhandle Eastern's market requirements over the next five and one-half years are those expenses which are set forth in Schedule 4 of Exhibit 43?

A. Yes.

[fol. 4790] Q. Now, commencing on page 4 of your written testimony in Exhibit 42, near the bottom of the page you set forth a number of "principles and assumptions," which you followed in arriving at the conclusions in your exhibit and in making your studies. The first one which appears on page 4 reads as follows:

"1. Panhandle Eastern will, so long as economically advisable, continue to apportion its takes between the Panhandle field and the Hugoton field on approximately the present basis."

Is that one of the principles that you follow or assumptions that you follow?

A. That is correct, Mr. Littman.

Q. Now, I refer you to Schedule 5 of Exhibit 43, entitled, "Probable Production From Panhandle Eastern's Own Wells and Wells Under Gas Contract (Panhandle Field) During the Period July 1, 1940, to December 31, 1956."

Were the figures shown in Schedule 5 arrived at by a calculation involving the percentages discussed by you under the assumption No. 1, which I read a moment ago?

A. As long as it was economically possible.

. . . . . .

[fol. 4791] Q. Do you understand my question?

A. Yes, I feel that I do. In other words, you want to know if I based that schedule on the application of the same percentages that we used in the year 1941 down through the years.

The answer is no, because it is not economical to do so. We did that as far as we could to give every lease owner, [fol. 4792] every producer as near the same benefit from their contract as possible, but only to the point where it did not cost Panhandle Eastern too much money to do so.

Q. How far through the years did you apply the percentages which are shown on page 5 of your written testimony?

A. Down to 1944. That is, they are approximate, they are within one per cent.

Q. In other words, if I understand you correctly, you apportioned the take as between the Panhandle field and the Hugoton field in almost the exact ratio as in the past for 1941, 1942, 1943, and 1944?

A. No, I said until 1944, but it, perhaps, might be well to go on from there. In the year 1944, in order to meet our peak requirement at Liberal, it was necessary to make further developments in the Hugoton field. In order to develop our leases in the Hugoton field to the point where we would be able to meet our peak requirement, it was necessary that we take slightly more gas from the Hugoton field for the year 1944, but as the load increased in 1945 we, again, went back to about the same percentage and that continued through the year 1945.

Q. Well, then, 1944 is an exception?

A. It was caused by having to develop to meet our anticipated peak load requirement at Liberal, inasmuch as [fol. 4793] we had to drill these extra wells, build the extra pipe line, why, we had to give these landowners somewhere about the same pull as we had been giving the others.

In 1944 our annual load from the Hugoton field was 22,568,683,000 cubic feet. From Texas we took 55 billion cubic feet. Our load increased—

Q. Are you speaking of the year 1942?

A. 1944 to explain—pardon me.

Q. I think you read a wrong figure.

A. I did, that should be 54 billion, instead of 55 billion.

Q. What was the figure for the Hugoton field?

A. I read the 1944 figure instead of the 1943 figure there.

In order to straighten this up and show what happened, perhaps it would be well to show what was taken for the year 1943 from each field.

Q. I think that would be a good idea.

A. The amount being 54 billion cubic feet from the Panhandle field of Texas, 19,051,408,000 cubic feet from the Hugoton field, making a total of 73,051,408,000 cubic feet. But in order to meet the anticipated peak load daily load for 1944, it was necessary to make some additional development in the Hugoton field and the total load increased to 77,568,683,000 cubic feet, and the increase from [fol. 4794] the Panhandle field of Texas was only one billion feet, so that changed the percentage up to 29.10, which was out of line from the split between the fields that we had been using.

Does that explain it all right, Mr. Littman?

Q. Yes, that explains the exception for the year 1944. Then, thereafter, did you go back to the same percentage of taking from the two fields?

A. To the year 1945 we did. At that time we had reached what we felt would be the maximum amount of gas that we could take from the Panhandle field of Texas with a reasonable investment. From the year 1945 on the load increases coming from the Hugoton field and that changes the percentage to a point where a greater per cent comes from the Hugoton field than had been taken from it in the years 1941 through 1945.

Q. What governs or fixes the take from the Panhandle field from 1946, and thereafter?

A. The capacity of the system and the ability of the wells to deliver gas at economic pressures.

Q. Both? A. Both.

Q. At the same time?

A. Yes. If we had a different system, it would probably be economical to produce wells at lower pressures, but it would not be a sound investment to install that type [fol. 4795] of system.

Q. Are you speaking now of the present system?

A. No, I am not. I am speaking of the system which has been revised or looped and is included in the capital expenditures shown in Schedule 2 of Exhibit 43.

Q. That is for the anticipated increased load?

A. Yes, sir.

Q. Then, is my understanding correct that Schedule 5 of Exhibit 43 is referable wholly to the anticipated future load?

A. I am sorry, I didn't get one word there. Is what?

Q. Is referable wholly to the anticipated increased load? A. Yes, that is right.

Q. This schedule No. 5, to which I just referred, could not be used in connection with the basic load, so-called?

A. No, sir.

. . . . . .

[fol. 4800] Q. Your exhibits do not show the figures for the Hugoton Field which are comparable to those shown in Schedule 5 for the Panhandle Field which, of course, is for the anticipated future load?

A. That is correct.

Q. I would like to have you read into the record the comparable figures, Mr. Hinton, in the same detail as shown in Schedule 5 of Exhibit 42.

A. How do you want that, Mr. Littman? Do you want me to read those in, mention the year first and then the amount?

Q. I think, perhaps, the reporter might make a tabu-[fol. 4801] lation on one of the pages similar to that shown in Schedule 5 and then you could read across, that is, having one column "Period" and in the second column "The Panhandle Eastern Wells" and in the third column "Gas Purchased Wells".

Perhaps it might save time, Mr. Hinton, if you could furnish us with an exhibit showing the figures which I just requested and, also, showing the data for both fields under the basic load.

A. In other words, you just want the total that we expect to take from both fields, that is, the amount from each field under both the basic load and the anticipated load?

Q. Yes.

A. And that is not to be split between company wells and gas purchased wells?

Q. I would like to have it split as between the company wells and gas purchased wells, showing the same detail as you show here in Schedule 5.

A. That is going to be rather difficult to work out in the Hugoton field, because while we have it established in Kansas, we are not too familiar with what size well we are going to get either in Texas County, Oklahoma, or Sherman County, Hansford, and that will change the proportion between the produced gas, that is, the gas produced by Panhandle Eastern, and that purchased by Panhandle Eastern.

Do you understand what I mean?

[fol. 4802] The value of the well governs the division between purchased and produced gas.

Trial Examiner: In other words, you don't feel confident in estimates that you can make now based on advance history?

The Witness: Well, not down and through 1951, because there has been so little drilling down there, and especially in the Hansford County acreage. I could make one, but it would be a pure estimate.

. . . . . .

[fol. 4803] By Mr. Littman:

Q. What factors governed the determination of the total withdrawals for each of the years 1941 to 1956 shown in Schedule 5 of Exhibit 43?

A. Acreage and potential. That is, the proration formula which is used in the Panhandle Field, Texas, governed the division of the loads shown on Schedule 5, Exhibit 43.

Q. Mr. Hinton, my question had reference to the total take from the Panhandle Field, which consists of the total of Columns B and C.

A. What governed the total?

[fol. 4804] Q. Yes, what factors governed your determination of the total withdrawals for each of the years shown in Schedule 5?

A. The division between the two fields of the total load based on the same division as was effective for 1941, with the exception of the year 1944, which was curtailed to some extent over what it might have been were it not for the fact that it was necessary to develop Hugoton Field to a greater extent in order to meet the peak day requirement in the Liberal station.

Q. Is my understanding correct, that you took the total requirement from both fields and simply applied a percentage for each of the years to secure the total take from the Panhandle Field except for the year 1944?

A. A near percentage, I would say, because we kept the take from the Panhandle Field in round numbers, and in order to do that, why, it fluctuated the percentage to a certain extent which was less than a total of one percent.

Q. Now, how far down through this schedule does that situation prevail?

A. Down to the year 1946.

Q. But that method was not used, namely, the percentage method, was not used after 1946?

A. That is correct.

[fol. 4805] Q. That is, my statement is correct? A. Yes.

Q. What method was used to arrive at the total take from the Panhandle Field represented by the totals of Columns B and C for the year 1947 down through 1956?

A. Horsepower and pipe line capacity.

Q. In other words, from 1947 down to 1956, you arrived at the total production for the Panhandle Field by assuming that you would take out all of the gas that you could take out with the gathering and transmission facilities on hand?

A. No, I would not say all that it would be possible to take out, because, as that load becomes smaller, in all probability the development of the field will be held back in the Hugoton Field and the amount of gas that will be taken from the Panhandle Field will be taken during the peak load months for two reasons, and that is that it will cost the company less money in the way of capital expenditures and the other is that when the pressure gets down to a lower point, it will not be economical to try to produce a gas well every day out of the year.

Q. Let's take each of the years, Mr. Hinton, and see if we cannot get a better understanding of your method.

Now, what was the total estimated future load for the year 1942?

A. 68,101,459,000 cubic feet.

Q. You mean M. c. f.?

[fol. 4806] A. No, I said 68 billion. If it were M. c. f., it would be 68 million.

Q. I am sorry. Now, would you mind stating your figures in M. c. f. because they are so stated in Schedule 5 and it may be easier to follow?

A. I intended to ask you which way you would rather have me use those.

Q. I think M. c. f. would be much more convenient.

Now, you have determined that out of the 68,101,459 M. c. f. required to be produced to meet Mr. Morton's 1942 load, that you would take 50 million M. c. f. of the Panhandle Field and 18,101,459 M. c. f. from the Hugoton Field. Is that correct? A. That is correct.

Q. Now, what I am seeking to have you explain is, how did you arrive at the 50 million M. c. f. amount which, of course, represents the total of Columns B and C in Schedule 5 of Exhibit 43 for the year 1942?

A. The foundation for those figures for the two fields is based on our acquiring greatest percent of gas in place possible without curtailing production to the extent that we would be doing an injustice to the landowners on which the wells are located.

Q. Are you speaking of the Texas Panhandle Field?

A. I am speaking of both fields.

Q. How did you arrive at the division or apportionment [fol. 4807] of take between the two fields, that is, between the 50 million and the 18 million-odd M. c. f.?

A. By applying the development of our company showing how we would participate in each field in relationship to the total development in each field, and taking all possible from the acreage surrounded by the areas of greatest withdrawal by other companies and without cutting back the Hugoton Field production where the withdrawal is much, much lighter than it is in the Texas Field.

Q. Is the method by which you arrive at the apportionment of take as between these two fields shown in your working papers, Mr. Hinton?

A. No, sir, I do not believe it is. I mean, it would be very difficult to put this on paper. It is something that you just learn by being in contact with the two fields and knowing about what the rate of withdrawal is per acre from the areas in which the wells are located.

Q. Well, is it simply a judgment figure?

A. To some extent, it is a judgment figure, but it is influenced by what is actually happening.

Q. Is there any mathematical computation behind the apportionment?

A. To some extent, yes.

Q. To what extent?

A. To the extent that it is necessary to find out what [fol. 4808] the per acre withdrawal is around the different wells owned by the company and trying to keep the withdrawal in proportion to what is happening around our leases as nearly as possible without cutting back the production from the landowners to a point where the company feels that it would not be fair.

Q. What was there to prevent you from concluding that you could have taken 40 million M. c. f. from the Panhandle Field in 1942, rather than 50 million in 1942?

A. Because 40 million from the Panhandle would not come in nearly protecting our reserve in the Panhandle as the 50 million will.

Q. What was there to prevent you from withdrawing 60 million from the Panhandle Field for the year 1942?

A. The fact that it is necessary to have sufficient development in the Hugoton Field to meet our four-months' winter requirements, and supply our peak day and if we had that development in the Hugoton Field, then it is necessary that we take some gas from each of those wells all through the year, and in order to give the landowners a fair share of the production, it was necessary to take that amount of gas from the Hugoton Field.

In other words, if we would take 60 million M. c. f. from the Panhandle Field, that would mean that we would only be taking approximately 8 million from 137 wells in the Hugoton Field, which would not be proportionate with [fol. 4809] the take of the wells surrounding our leases in that field.

Q. What was there to prevent you from taking 52 million M. c. f. from the Panhandle Field in 1942, rather than precisely 50 million?

A. Fifty million is a round figure, and if we would have taken 52 million based on our anticipation of market requirements for the year, it would mean that we would not be protecting our Kansas reserve inasmuch as the

withdrawal from the Hugoton Field will increase for that year.

Q. Well, in other words, if you had done what I suggested and had taken 52 million M. c. f. from the Panhandle Field in 1942, you would have had to take 16 million M. c. f. from the Hugoton Field and do you suggest that that could not be done?

A. That could be done, Mr. Littman, but I do not think it would be as good a business as it is to take it as the way we have it down here.

Now, you will remember that we have developed Oklahoma gas from 1941 to 1942 and the amount of gas that we are going to take from the same area of Hugoton Field will be approximately the same, but the increase in that amount comes from Texas County, Oklahoma, of the Hugoton Field.

Q. Now, under the basic load, your working papers show that 16 million M. c. f. would be taken from the Hugoton Field, is that correct?

[fol. 4810] A. That is correct, which means that we would not be able to protect our reserves and meet the withdrawal of the field and by not meeting the withdrawal, not taking approximately the same proportion from our acreage as is being taken from others, it means that our reserves would be diminished without our being able to get full benefit from them.

Q. You manage to do that under the basic load, do you not?

A. No, we do not, and under the basic load, the total recovery from our reserves would be much, much less than it will be by increasing our market.

Q. Now, was the method used for the year 1943 with respect to determining the total takes as between the two fields the same as that which you have described for the year 1942?

A. Hardly. It wasn't exactly the same. In other words, we will not take quite as much per acre from the Hugoton Field in 1943 as we have here for 1942.

Q. Why?

A. Due to the fact that we have a load increase that will have to be met from the Oklahoma acreage, and in order to supply the increase from the Oklahoma acreage, it is neces-

sary to drill more wells and by the amount of acreage which we will have by drilling from 1942 to 1943, it will [fol. 4811] mean that we will be taking somewhat less per acre in the Hugoton Field in 1943 than we did in 1942.

Q. This is kind of a trial and error method, is it not, Mr. Hinton? I am earnestly endeavoring to ascertain what you did.

A. Yes, I would say that it was more trial than error though, because when we get the answer, we do not feel we have the error left.

Q. I was not implying there was an error, necessarily, in your method. I was merely using a term that is used to express a cut and try method.

A. Yes, using an engineering term, of cut and fill.

Q. That is the type of method that you have used?

A. Yes, sir.

Q. And I presume that is the type of method you feel must be necessarily used?

A. It has to be watched down through the years. It is not possible to make a forecast this many years in advance and say that this is going to be exactly the right figure, because the withdrawal could change from the two fields very decidedly, and, of course, then we would not be protecting our reserve exactly as we would like to by using the same set of figures, but it is as good as I believe anyone could make at the present time.

Q. In other words, circumstances may arise which would [fol. 4812] substantially alter the proportion of take as between the two fields?

A. That is true. For instance, if the carbon black industry was moved to the Hugoton Field from the Texas Field, why, then I would say that we would probably have to take the volumes that we have set for the Panhandle Field down here from the Hugoton Field, and the volume we have set for the Hugoton Field from the Panhandle Field.

Q. Now, you have given us a description of the method used in 1944 for the purpose of arriving at the total amount to be taken from the Panhandle Field and the total amount to be taken from the Hugoton Field, have you not?

A. Yes, sir.

Q. Or did you want to elaborate on that?

A. Well, I am willing to go ahead and explain if there is anything that is not clear about it. I will be glad to answer the question.

Q. Is the method used in 1945 the same that was used in 1943 for the purpose of determining the take as between the two fields?

A. Yes, with this exception, that by the time we reach 1945, our withdrawal per acre from the Panhandle Field will be increased, but we feel justified in increasing that, due to the fact that we would have never, with the exception of possibly the past year, been able to protect our re- [fol. 4813] serve in the Panhandle Field in proper order, due to the fact that we did not have the market.

Q. In other words, it is advantageous, you feel, to take it out of the Panhandle Field as quickly as possible?

A. That is the economical way to get the gas from the Panhandle Field.

Q. Would you explain why it is best to do that from an economical standpoint?

A. The pressure decline in the Panhandle Field is becoming more pronounced each year, and the 60 billion feet of gas that we could get in 1946 will cost us less than that 60 billion that we get in 1948, due to the fact that we will have to have more wells on the line; we will have to probably have several individual compressors on the various wells.

Our ratio of compression will be different at the Sneed Station; more fuel will be required; more engine hours will be required to get that same amount of gas into and through the Sneed Station as the pressure declines in the field.

Q. What about drainage?

A. As long as we are taking at a rate that is comparable with the other producers in the area in which we operate, why, we are not going to suffer a great deal of drainage.

However, if we could take, say, if we had a reserve there of a trillion feet and if we could take that trillion feet all within the next ten years, it would be worth much more [fol. 4814] to us than if we have to take it over a period of 15 years.

In other words, if we were assigned a certain amount of gas, the shortest possible time that we could take that amount of gas out, why, the less it will cost us.

Q. I take it then, that one of the controlling considerations in the preparation of this Schedule 5 and this estimate is the element which you mentioned a moment ago, namely, that you are endeavoring to get this gas out of the Panhandle Field as quickly as possible, having in mind the market?

A. We are trying to take so that we do not lose any more of the reserve which we originally had in the Panhandle Field.

. . . . . .

Q. Now, you have just completed your explanation of the method used for the year 1945, have you?

A. I believe that would apply pretty well to any year, Mr. Littman.

Q. Was the method that you used in 1946 to determine the 60 million M. c. f. withdrawal from the Panhandle Field any different from the methods used in the previous year?

A. Yes, to this extent, that in 1946 we anticipate a load which makes it necessary that we take a greater amount of gas from the field.

[fol. 4815] In other words, the percentage changes from between 26 and 27 percent to almost 35 percent from the Hugoton Field.

Q. Why?

A. Because at that time we will be taking a total amount of gas of 92,034,276 M. c. f. estimated, and we do not feel that we can economically develop in the Panhandle Field to take annual loads greater than 60 million feet and, for that reason, instead of going ahead and spending many thousands of dollars which would be necessary to take amounts in excess of 60 million feet, we are then changing our development up to the newer area in the Hugoton Field where we feel that we will get an ultimate recovery of much more gas for the same capital expenditure.

Q. Sixty million M. c. f. withdrawal from the Panhandle Field which is first reached in 1945 and continues

through 1948 is the largest withdrawal of any shown in your Schedule 5, is that correct? [—].

[A]. Do you use any different method in 1947 to determine the 60 million M. c. f. take from the Panhandle Field?

A. We feel that is all that our development will carry and at that time, as in 1946, we are working in an area of declining pressures and it would not, we feel, or I feel, be a good investment to go in there and put in additional horsepower in large number and larger pipe lines in order to get what extra amount that we could get over the 60 million M. c. f.

[fol. 4816] Q. What method did you use in 1948?

A. In 1948, the same.

Q. Now, looking at 1949, the total take from the Panhandle Field by Panhandle Eastern drops from 60 million M. c. f. to 55 million M. c. f.

How did you arrive at that figure?

A. The pipe line capacity, ratio of compression, the deliverability of the wells.

Q. You could not get any more gas out in that year?

A. That is a round figure and that can fluctuate either way. I feel it is very close to correct, but I do not mean to say that it will be exactly 55 million M. c. f.

Q. Now, does the method used for the year 1949 apply for the remaining years through 1956 shown in Schedule 5 of Exhibit 43?

A. Yes, it does.

Q. Mr. Hinton, a few moments ago, you made reference to production per acre. Do you have a certain standard production per acre that you seek to derive from the acreage in the Panhandle Field and from the Hugoton Field?

A. I do not believe I would call it a standard. It is that withdrawal per acre that is set by the total withdrawal from the entire field.

Did I make myself clear? In other words, if we had a [fol. 4817] thousand acres in a field and the take was 5 million a year from that field, see, that would mean that there would be 500 M. c. f. per acre, I believe, withdrawal and that is the way we take the entire field, find out what the total withdrawal from the entire field is and especially

around close to the areas in which we operate, and try to regulate our withdrawal so that we will suffer the least amount of migration of gas to outlying leases.

Q. You have named all of the factors that govern the determination of the total withdrawals as between the two fields, have you?

A. All I can think of, Mr. Littman. I believe they have all been covered.

Q. Now, referring back to your Principle 1 which appears at the bottom of Page 4 of your written testimony in which you state:

"Panhandle Eastern will, so long as economically advisable, continue to apportion its takes between the Panhandle Field and the Hugoton Field approximately on the present basis."

Isn't it apparent, Mr. Hinton, that that so-called principle or assumption did not have very much to do with the working out of your Schedule No. 5?

A. I would say that it had a great deal to do with it; on the contrary. If it were not for the fact we were trying to carry on the present practice, we would immediately [fol. 4818] have jumped up our withdrawal from the Panhandle Field by maybe 10 to 15 billion a year over what we have it here.

In other words, we would have paid no attention to the protection of the reserve in the Hugoton Field and the treatment of the landowners. We would immediately have gone down there to try to get the 40 or 50 billion feet of gas at a higher pressure which would have come at a less cost to the company, so I feel we have stuck to that very closely, and that it is governed by economics entirely.

* * * * * * * * *

Q. When did the economics cause the apportionment of take as between the Panhandle Field and the Hugoton Field to change from the approximately present basis?

A. I would say, the year 1946.

Q. And thereafter?

A. And thereafter.

Q. So that you have only four full years wherein the apportionment of take as between the Panhandle Field

[fol. 4819] and the Hugoton Field is approximately on the present basis? A. As long as economically possible.

Q. Before I go to your second assumption, what is the present annual capacity of the main line from Sneed compressor station to Liberal station?

A. On the basis under which we have to operate with a load factor such as we have, it is now approximately 45 million M. c. f.

Q. And what is the maximum daily capacity?

A. We have recently reached 165 million of 8-ounce gas, that is 14.73 gas.

Mr. Culton: Roughly, what would that be on 16.4 divided by about 110?

The Witness: It would be about 149.

By Mr. Littman:

Q. What additional capacity will be provided on this main line running from Sneed compressor station to Liberal station by the capital additions which you estimate will be required under the future load?

A. There will be the installation of two 1300 horsepower units at Sneed making a total additional horsepower of 2600 horsepower; there will be two 650 units installed at the Hansford station, making a total addition of 1300 horsepower to that station; the line from the present Hansford station south will be looped with 22-inch [fol. 4820] pipe, a distance of about 32 miles; the present pipe line from Liberal station south will be looped for a distance of about 35 miles with 26-inch pipe.

The section of pipe from the intake side of Sneed station down to Windmill Junction, that is a point where the present 18 and 20 join into a single 20-inch line will be looped with 26-inch line a distance of 2.7 miles from Windmill Junction southwest to what is known as Zofness station.

That strip of present pipe line which is 20 inches in diameter will be looped with 22-inch pipe a distance of, as I remember, 8 miles and from Zofness station west, the present 12-inch line will be looped with 20-inch line and the present 16-inch line will be looped with 16-inch line.

Q. Now, what additional capacity will be provided on the line running from Sneed compressor station to Liberal

compressor station by reason of these capital additions which you mentioned?

A. I believe that is 220—I cannot find it right now. I have been working on several problems lately trying to get different volumes in there using the least amount of steel, and I have been changing these things around until that figure has slipped my mind, but I believe it is 220 million.

Q. 220,000 M.c.f. maximum daily capacity?

A. That is right.

Mr. Culton: Is that into Liberal or out of Sneed or both?

[fol. 4821] The Witness: It is into Liberal, out of Sneed.

By Mr. Littman:

Q. And what is the additional capacity which will be provided for that line by capital additions under the basic load?

A. Under the basic load, we can get by there for some time with the addition of extra horsepower, and I do not remember whether the pipe line enters into the 5½ year period or not.

It will eventually have to come to take care of the amount of gas we want from there.

Q. The capital additions are shown in your Exhibit 42 under the basic load from Pages 21 to 26?

A. Yes, that does have to occur under the basic load.

Q. You mean, you expect to loop the line between Sneed compressor and Liberal compressor stations?

A. We expect to loop from Liberal to Hansford, but not from Hansford to Sneed. The reason of the other loop is to pick up the Oklahoma gas in the future and at the same time utilize part of that capacity to be able to come into Liberal station at a more desirable intake pressure.

Q. Now, what will be the additional capacity provided by the capital expenditures under the basic load for this line as between Liberal station and Sneed station?

A. If the horsepower was put in at the present time [fol. 4822] and provided our dehydrating unit at Sneed works as it looks like it is going to and our condensate

separator works, it will be approximately 15 million per day.

. . . . . .

Q. In other words, the present capacity of 165,000 M.c.f. would be increased to 180,000 M.c.f.?

A. That is correct.

Q. Under the basic load expenditures?

A. That is right.

Q. And to 220,000 M.c.f. per day under the anticipated load expenditures?

A. That is right.

Q. Now, your second Principle or assumption reads as follows:

"It will continue to apportion its production between its own leaseholds and its gas purchase contract acreage on the basis now existing."

Is that correct?

A. That is correct.

Q. Who fixes the amount of gas to be produced from each company well?

A. I do.

Q. That is left very largely to your discretion?

A. Almost entirely.

[fol. 4823] Q. Who fixes the amount of gas to be produced from each gas purchase contract? A. I do.

Q. And that, of course, is left to your discretion very largely?

A. It is all based on the value of the well and the proration formula in the field and this is based on the fact that we assume that the same proration formula will continue in both fields as at the present.

Q. You used the term "based on the value at the well"?

A. Of the well.

Q. Value of the well?

A. That is right, the number of acres contained in the lease on which the well is drilled and the open flow of that well and, in Kansas, the pressure of the well.

Mr. Culton: You did not refer to dollar value then?

The Witness: No.

Mr. Culton: Gas value?

The Witness: Yes, gas value.

By Mr. Littman:

Q. That is the proration formula, is it not?

A. That is right. That is what this pertains to.

Q. The allocation is 50 percent to acreage and 50 per cent to open flow potentials?

A. In the Panhandle Field.

[fol. 4824] Q. In the Panhandle Field. Now, what is the proration formula used in the Hugoton Field?

A. The last order in the Hugoton Field was a division of the total production and the apportionment was on the basis of 80 percent of the total production being divided as governed by the well head pressure on each lease, the number of acres on each lease.

That is, the well head pressure times the number of acres contained in the lease was the basis for the division of 80 percent of the total production.

The other 20 percent was divided on the basis of a 20-minute pitot tube open flow test.

However, the 1938 order was the same with the exception that the division of the total production was 75 per cent and 25 percent and we have continued to prorate on that basis and will continue to do so until some further order comes up, because the last order has never been effective and by changing from one method to another, it is a very considerable task and if the present order does become effective and we operate under it, then our field will not be badly out of balance and we can get our wells in a proratable standing and adjustment whenever that occurs.

Q. You said a minute ago you were going to operate under the—what method?

A. The reason I gave both of them was that I could not [fol. 4825] say that we operate under the present Kansas proration order.

I explained what that was and then I explained that we are operating under 75 percent of our total production being allocated on the basis of pressure times acreage and 25 percent to a 20-minute pitot tube open flow test.

Q. Do vendors have the right to put compressors on their own wells and produce gas in excess of the present proportion?

A. No, sir. We tell them how much gas they are to put into our line and they are at liberty to put compressors on their line, but still the amount of gas that they put into our system is governed entirely by their participation in the total system.

Q. Is the allocation in the Panhandle Field prescribed by law?

A. No, sir, that is an outgrowth of the old proration order that was once in effect in the sweet field, sweet Panhandle Field, but I would have to get a lawyer to say what case that it was ruled out but it is no longer effective.

There is a sour gas proration order but no sweet gas proration order. This 50-50 is the old sweet proration order.

Q. There is nothing to prevent you—

A. (Interposing) I would not say, without a lawyer.

Mr. Culton: I think it is appropriate for me to say their contracts provide they take on the same ratable basis they [fol. 4826] take from their own wells. Those contracts are not in evidence, but it is a matter of fact.

Their contracts provide that Panhandle Eastern take from these other parties on the same proratable basis as they take from their own wells.

By Mr. Littman:

Q. Of course, there is no limitation with respect to increasing your take from both your own wells and the gas purchase wells in a given field, is there?

A. Do you mean by "given field" one that is not operated under a valid proration order?

Q. I mean the Panhandle Field.

A. The Panhandle Field?

Q. Yes.

A. That is correct. The take could be increased or decreased. It is governed by good judgment, we hope, our rate of withdrawal.

Q. What would you say as to the Hugoton Field?

A. At the present time, I do not think that I would want to spend too much money as an independent operator

in the Hugoton Field, because they are getting to the point in this proration case where there is going to be some decision made and if it is necessary to operate in the Hugoton Field under the present order, then it will be entirely up to others as to how much gas can be taken from the Hugoton Field.

[fol. 4827] Q. Now, what would be the effect upon the total amount of gas recovered by Panhandle Eastern if Panhandle Eastern would draw more heavily upon its own wells?

A. I am sorry, I do not believe I get that question.

Q. What would be the ultimate effect upon the amount of gas eventually recovered by Panhandle Eastern if the company were to draw more heavily than it now does upon its own wells?

A. I would say that there would be a breach of contract there. That is, our contracts with our purchase companies all have ratable take clauses, and it would be impossible to do that without breaking the contract.

Q. Let me put that same question to you, assuming that Panhandle Eastern were to increase its take equally and ratably as between its gas vendors and its own wells but stepped the entire production up.

What effect would that eventually have upon its own production?

A. It would mean that we would, in all probability, get the benefit of some gas migration.

Q. It would have the effect, would it not, of draining the areas of others?

A. What others?

Q. Other leaseholds owned by others?

A. Yes, but when you say "others," you are taking in [fol. 4828] a great deal of territory, because you might not be draining the adjoining lease at all. The formation might be such that there would be compensated drainage clear back to a point in the field where there had been no development to date.

Q. It would have the effect, would it not, of increasing the total amount of recovery eventually by Panhandle Eastern?

A. Yes, it would.

Q. And that is one of the advantages in taking it out faster, is it not?

A. It would be an advantage if we were trying to take advantage of that, but we have the name of fair operators in both of those fields and we intend to keep that name, and for that reason we are developing in such manner as to avoid a rate of withdrawal which would be termed as exorbitant by other operators in the field, and that is one element that enters in the development system of our company.

Q. Mr. Hinton, your third assumption appears on Page 6, and reads as follows:

"Additional wells in Panhandle Eastern's reserves in the Panhandle Field will be drilled on only its own leases."

In your discussion of that assumption, you point out that there are 15 locations on the leaseholds in the Panhandle Field belonging to Panhandle Eastern Pipe Line Company, do you not?

[fol. 4829] A. That is right.

Q. Aren't those 15 wells set forth in your statement of capital expenditures to be made under both the basic and anticipated loads?

A. Yes, sir. Going back to 3 there, I just wondered if you noted the exception of the one location that there may be an additional purchase well or an additional well drilled on acreage under a gas purchase contract?

Q. Yes, I noted that. I was confining my question to the 15 locations on the leaseholds in the Panhandle Field owned by Panhandle Eastern.

Now, those 15 wells are going to be drilled under both the basic and the anticipated load theories, is that right?

A. That is correct.

Q. Which leads me to believe, and I want you to tell me whether I am correct or not, that the reason for drilling these wells is primarily because of the obligations of existing lease contracts?

A. Well, I do not know whether we would say obligations or not, I would say, under the terms of the present lease, we are not obligated to drill under all of those, and I am not sure whether we are obligated to drill on any or not.

We could let those leases expire, but if we wanted to keep them as part of our reserve and be assured that we could continue to have them, it will be necessary to drill [fol. 4830] them, because somebody might come in there and offer $25 or $50 an acre for those same leases and renew them or top-lease our present lease.

Q. The point I am making is simply this, Mr. Hinton, in so far as the basic load is concerned, it would not be necessary to drill these 15 wells to provide sufficient gas?

A. No, it would be economical to drill them, though.

Q. It would be advisable to drill them?

A. It would be economical to drill them, as well as advisable.

Q. But not because of the immediate requirement of gas?

A. No, that is right, but in order to avoid paying a renewal cost and also in order to get the benefit of those wells as a participating element in the total market from the Panhandle Field, it will be cutting back the amount of gas which we buy and making a total over-all saving to Panhandle Eastern which was taken into consideration, as well as the lease term.

Q. Well, Mr. Hinton, the last sentence in the first paragraph of Page 6 was the one that I was trying to have clarified. You say:

"The time for drilling these wells will be determined by the demands for additional gas and the obligations of existing lease contracts."

[fol. 4831] Now, in so far as the basic load is concerned, the time for drilling these 15 wells will be determined—

A. (Interposing) By the terms of the lease.

Q. By the terms of the lease, is that right?

A. Yes.

[fol. 4835] C. H. Hinton a witness, having been previously duly sworn, resumed the stand and testified further as follows:

Cross-Examination (Continued)

By Mr. Littman:

Q. Mr. Hinton, does Panhandle Eastern expect to secure additional acreage in the Panhandle Field?

A. No.

Q. Why?

A. That is practically an impossibility.

Q. Why?

A. Because there is no acreage left to secure that lies within the area in which we operate and which would be economical to develop and connect to our present system.

Q. Have you made a full and thorough investigation of that?

A. Yes, sir.

Q. Does Panhandle Eastern expect to secure additional supplies of gas from vendors in the Panhandle Field?

A. I do not think so.

Q. Why?

A. Because if we did secure additional gas there, it would mean that we would take less gas from the acreage which we have under lease and which would not permit our recovering the amount of gas which we should re- [fol. 4836] cover from our own acreage and that which is now under gas purchase contract.

Q. I am afraid I do not understand your answer, Mr. Hinton.

A. It again goes back to the rate of withdrawal per acre from the Panhandle Field in order that we would be able to withdraw from our own acreage and that which is now under gas purchase contract the amounts of gas which would insure that we are protecting our reserve.

If we took on the additional acreage, it would mean that the rate of withdrawal per acre would be curtailed to the extent that we would not be able to get the amount of gas that we should from our present acreage.

Q. Why?

A. Because we would be taking less gas per acre each year by the addition of more wells.

Q. I am afraid I still do not understand your answer.

A. Perhaps I should give you an example.

Q. Very well.

A. We will assume that our rate of withdrawal per acre from wells connected to our system at the present time is 500 M. c. f. per year.

Q. Now, you are speaking of both the company-owned wells and vendors' wells?

A. That is right.

[fol. 4837-4847] We will assume that we connect 20 additional wells. The amount of gas which we would take per acre would be reduced in the proportion that the 20 additional wells would participate in the total market or the total withdrawal by Panhandle Eastern and by declining that rate of withdrawal, it would place us in the position that we would not be able to take as much gas from the reserve which we have at the present time as we will without the connection of additional wells.

Q. Do you mean that these 20 additional wells would drain your present acreage?

A. No.

Q. Is that what you mean?

A. No. You just have to take into consideration the total withdrawal by everyone from the Panhandle Field and if we at this time would connect additional wells, it would mean that we would retard the amount of gas that we take from each of the present wells, and we feel that we have about the proper development there for the system which we feel it would be economical to develop to take the production from the Panhandle Field.

Trial Examiner: May I ask if there is some understanding between the competitive companies that in any way affects the statement you have made?

The Witness: There is none. It would be better, perhaps, if there were.

[fol. 4848] Mr. Lee: May I ask a question there?

Would that addition you have referred to, would that situation operate to preclude Panhandle from obtaining additional wells in the field if they were available?

The Witness: No. When you say, "preclude," I do not know exactly what the interpretation of that would be.

Mr. Lee: You told Mr. Littman that there were no more gas leases, as I understood it, or purchases of wells available in the Panhandle Field.

The Witness: That are not under lease.

Mr. Lee: Would the condition that you have just described prelude Panhandle from taking on additional leases if the opportunity were afforded in that field?

The Witness: It would, in this respect, Mr. Lee. The amount of gas that has been withdrawn from that field to date and the field performance indicate that the remaining length of life of that field does not extend over a great number of years, and in order to add these additional wells and maintain our rate of withdrawal per acre, it would mean that we would have to spend many thousands of dollars to increase the capacity of our pipe line system from both the gathering standpoint and the trunk gathering line from Sneed into Liberal, Kansas, and it is debatable whether that would be a wise expenditure, taking into consideration the status of the Panhandle Field at this time.

[fol. 4849] By Mr. Littman:

Q. Do I understand you to mean that if a gas vendor had a number of wells, let us say, some reasonable distance from your acreage so as to exclude the question of drainage, and wanted to sell gas to your company, let us say in the amount of 5 million M. c. f. per year, that you would not be interested in buying that gas?

A. I do not think we would unless the picture would take a radical change from the future that we have in mind. When I say "we," I mean the company.

Q. Suppose it were 10 million instead of 5 million M. c. f. Would that change the picture any?

A. No, because with our present projected estimated market, we have laid out a development program which is believed to be the most economical from the standpoint of the production of gas by this company.

Q. Well, you mean that you are more or less wedded to a definite program which you have submitted in your Exhibit 42 of capital expenditures and withdrawals, is that right?

A. No, I would not say that we were wedded to any definite program, except that program which is backed by figures that show it is sound economics to develop as we have laid out our plan.

Mr. Goodman: May I ask a question at this point?

Mr. Littman: Certainly.

[fol. 4850] By Mr. Goodman:

Q. You have developed a plan for what you regard as the most economical exploitation of the field in view of your markets, is that right?

A. As nearly as possible.

Q. And if you acquired more acreage, that would be a substantial deviation from that plan?

A. Do you mean more acreage in the Panhandle Field of Texas?

Q. In the Panhandle Field.

A. That would.

Q. And it would effect a less economical exploitation of the field?

A. It would mean more capital expenditure and it would mean less recovery.

Q. I understand. The total result, in your judgment, would be that the acquisition of more acreage in the Panhandle Field would result in a less economical exploitation of the field in comparison with the plan that you have now?

A. There is only one way that I would qualify that, and that would be that if our company would be able to have at this time, without spending a great deal of money, an additional 50,000 acres in the Panhandle Field, then I would say it would probably justify our rearranging our system.

[fol. 4851] Q. Yes. In other words, it would depend upon the costs involved in modifying your present plan?

A. That is right.

Q. And the results that could be secured?

A. Weighed against the development in the Hugoton Field.

Q. Yes, I follow you.

Now, Mr. Hinton, how long has that plan to which you have just referred been in existence?

A. In a vague sort of form, for the past several years.

Q. Well, have computations been made concerning the ultimate economy of that plan?

A. There have.

Q. And where do those computations appear?

A. I am not sure that they have been filed away carefully. They might be difficult to find, but they have been made and they have been studied and then probably laid aside.

The management has gotten the general idea in mind and they were never carried further into detail.

Q. You have a fundamental plan for the exploitation of the Panhandle Field showing the costs of that exploitation and the results which may be secured, haven't you?

A. You mean outside of the study here? (Indicating)

Q. Well, you answer.

[fol. 4852] A. Not a detailed study showing dollars and cents all the way along. It is one of those things that in the gas business the general idea is obtained by making various sets of figures.

It is presented to the management and when it is felt that the management has the problem in mind, then it is not pursued further into detail.

Q. But you have some approximation of unit costs of exploiting that field, haven't you?

A. Yes, if we did not—

Q. (Interposing) You would not know where you were?

A. That is right.

Q. You would not have the basis of material to determine whether it would pay to take on additional acreage?

A. That is right.

Q. In other words, that involves some idea of what you will spend to exploit the field entirely, doesn't it?

A. I would say that it does, not in a detailed sort of way, but the key to that problem, Mr. Goodman, is the total amount of gas, what percent of the gas that was originally in place can be recovered by a company.

Q. That is right, that is right.

Now, the cost of recovering it approximately, an approximation of the cost—

A. (Interposing) That is right.

[fol. 4853] Q. (Continuing) No doubt not in the form of the exact itemization of the cost items, but by such

generalities as one customarily uses in projecting plans for a rather remote future, is that right?

A. That is correct.

Q. Do you make those studies?

A. I make probably the most of them.

Q. And who passes upon them?

A. When I get something in mind that I feel should be called to the attention of the management, I take it to my immediate superior first.

Q. Who is he?

A. Mr. H. W. Pope.

Q. Mr. Pope.

A. And he will usually call Mr. Neuner and then there will probably be four or five of the department heads go over the problem and see whether it is sound or not. The idea—

Q. (Interposing) Just a minute. As a matter of fact, the fundamental project for the exploitation of the Panhandle Field is something which is Mr. Neuner's responsibility, isn't it?

A. I do not believe that you could say that would be Mr. Neuner's total responsibility.

Q. Well, I do not mean to speak in terms of total, but [fol. 4854] he is the top man on it, isn't he, for all practical purposes?

A. No, that would go to Mr. Creveling before any definite action was taken on a major problem.

Q. Well, I am not referring to definite action, I am referring to that fundamental master plan of the exploitation of the field and the development of the tentative and fairly standard unit costs which you use to guide you and as generally used by the management as a rule of thumb in determining whether it would be advisable to take on more acreage or as being basic to your immediate reaction that it would not, for example.

A. It is most certainly true that Mr. Neuner would have to have the plan well in mind.

Q. Yes, perhaps better in mind than you would, is that right?

A. Well, looking at the over-all picture, certainly. Looking at the production end of it, probably not as well, because he would not have time to go into the detail that I would have on that problem.

Q. Now, what written form do these studies take?

A. There are very few studies that are prepared that are made in final written form. Most of the studies—

Mr. Culton: (Interposing) If you have some example, show him one.

Mr. Goodman: Wait a minute. I do not want to be interrupted here.

[fol. 4855] The Witness: Most of the studies are made on 14-column paper with notations along and they are presented in pencil. They are seldom typed.

By Mr. Goodman:

Q. Do you carry, or do your make, a private reference study, that is to say, do you keep a general fundamental study as a matter of your private records for your own guidance in that matter?

A. I have a great many files of figures to which I refer from time to time after they have been prepared, perhaps two or three years.

Q. Well, do you systematize that and keep it together as a matter for your fundamental reference?

A. I hate to answer that question, because that is one of my weaknesses, that is, filing. I oftentimes have difficulty in going back and finding what I want, but since I am under oath here, that is what I have to say.

Q. Now, you say you have developed this in terms of unit costs governing the complete exploitation of the field, is that right?

A. That is right.

Q. And what units do you use? Do you have that in mind or on paper?

A. The units that I use include the royalty cost.

[fol. 4856] Q. The what?

A. The royalty cost. That is the royalty on the gas which is produced from our own leases, the purchase price of gas at the well head, the capital expenditure and the operation.

There are many items which I cannot get until it is possible to have the Accounting Department furnish the

data, that is, on amortization, the depletion of reserves from the standpoint of income tax and, well, you are more familiar with accounting than I am and I will probably miss some of them, but there are many items that are set up on the accounting records which I do not use or do not make myself.

They come from the Accounting Department, and it is seldom that I have the opportunity to compile a complete cost. That is, I base my studies usually on the cost of gas, purchase cost at the well head and weigh that against the capital expenditure required to change the amount which we get from our acreage from each field, and it is the governing cost as far as I am concerned, because the amortization and the depletion is a figure that is going to occur, in my judgment, about the same anyway, and I think those would be the governing factors on the control of a development in the gathering system of our company.

Q. Let me see if I understand you correctly. You take as a standard for the purposes of reference, the purchase [fol. 4857] cost of gas at the well head and then, in determining whether a particular development of a project is advantageous or not, you compare the costs or the unit cost of that which would result from that project if that project were carried through with the purchase cost of gas at the well head, is that your fundamental method?

A. Yes.

Q. And point of reference?

A. Yes, sir.

Q. And what figure do you use for the purchase cost of gas?

A. The purchase price.

Q. What figure is it? Is it one figure or may it be many figures?

A. No, I take the method of proration for that field and find out what different costs participate in the total market. That is, we have 2½ cent gas, we have 3½ cent gas, we have 4, 4½ and 5 cent gas, and in order to determine the cost of gas, why, it is necessary to find out to what extent each price of gas participates in the total market.

Q. I see.

Now then, you find out a standard of reference for purchased gas, and then you prepare a cost study for producing gas under the new project or the contemplated project?

A. Yes. (Indicated by nod of head.)

[fol. 4858] Mr. Wheat: Did you answer the question "yes"?

Mr. Goodman: He answered "yes."

Mr. Wheat: He nodded his head, and I wondered if the reporter got it.

By Mr. Goodman:

Q. And that project is justified or not fundamentally by the relation of those figures, the unit cost on production in comparison with the unit cost of purchase, is that right?

A. Always keeping in mind that the greatest percent of the amount of gas estimated to be in place will be recovered.

Q. I see.

Now, do you have in mind, Mr. Hinton, a substantial development project for the recovery of gas in the Panhandle Field?

A. I would say that it is a medium extensive program.

Q. I mean, do you have in mind a project—

A. (Interposing) You mean a definite—

Q. (Continuing) A definite project.

A. Yes.

Q. What is the name of that project?

A. Well, I do not suppose—

Q. (Interposing) The one you have in mind.

A. (Continuing) I do not suppose that it has this title on paper, but if I were going to make a title for it right now, I would say that it is "The additional requirement [fol. 4859] to the Panhandle Field, Texas, gathering system to secure the greatest ultimate recovery from reserves under lease and under contract at this time."

Q. And that project was reduced to a comparison with the unit cost of purchased gas, is that right?

A. No, because that includes purchased gas all the way through. That includes 53 wells now under gas purchase contract.

Q. I do not think you have quite answered my question.

I first had in mind definitely a project as we were talking about it, in which you would have occasion to compare the relative advantage of the project in comparison with the cost of purchased gas.

A. No, I believe that you have missed the point that I have tried to bring out, and that is this:

That in order to obtain a high percentage recovery from our present reserves, it is necessary that we take the approximate amount of gas which we have laid out or assembled in this study here, that is, Exhibit 43, Schedule 5, and in order to take the amount of gas that we have listed in this Schedule 5 of Exhibit 43, it is necessary to make the additional capital expenditures which have been set out, the reason being that the original line was not designed to carry these volumes of gas and it is not a study weighing between company cost and purchase cost of gas.

[fol. 4860] It is a capital expenditure that is required to take from both company and gas purchase wells amounts of gas which it is believed will give us our greatest ultimate recovery for the economical capital expenditure required.

Mr. Littman: You are now speaking, and have been speaking, of the anticipated load, haven't you?

The Witness: Yes.

By Mr. Goodman:

Q. Put that out of your mind for the moment, and go back to the subject of our previous questions and answers.

We were talking about a method of determining the advantage of a particular project for the recovery of gas, and you mentioned a fundamental basis of reference, the unit cost of purchased gas, and I asked you to—

A. (Interposing) No, Mr. Goodman, I did not say the unit cost of purchased gas alone. It is a combination of the cost of company gas and purchased gas. It is a weighted figure.

In other words, if there is 50 percent of it that is based on the royalty cost and 50 percent on the purchase price, why, it is a combination of those two figures that actually set the cost of that gas at the well head.

Q. All right.

Now, I ask you to have in mind a specific project, exemplified by that mode of calculation. I do not see it in Ex-
[fol. 4861] hibit 43. That is not anything I had in mind.

I had in mind a specific project which exemplified unit cost calculations.

A. And by unit cost, what do you mean that that unit cost should include?

Q. Well, I do not care what it includes. I want a unit cost, not of material, but of the product, namely, of gas.

A. I would say that 43 is a specific problem and the cost of that gas under 43—

Mr. Littman: (Interposing) You mean Exhibit 43?

The Witness: Exhibit 43 in Texas at the present time, that the weighted average will be, as I recall, 1.8549 cents per M. c. f.

Mr. Littman: May I have that figure, please?

(Whereupon, the figure indicated was read by the reporter.)

The Witness: May I check that back?

Mr. Littman: It might be well to do that.

By Mr. Goodman:

Q. That is something that was developed in supplement to Exhibit 43, is that right?

A. That was developed for the 1942 budget.

Q. Now, I had asked you about that before?

A. That is right.

Q. And your counsel had stated that Mr. Burnham would be the—

[fol. 4862] Mr. Culton: (Interposing) That is not so.

Mr. Goodman: What is not so?

Mr. Culton: That I stated Mr. Burnham would testify on that. Mr. Burnham's testimony was related to the Consumers Power Company estimate.

That is what I told you Mr. Burnham would make an estimate on.

Mr. Goodman: Was it agreed that you would then produce Mr. Hinton's figures?

Mr. Culton: You may get any information Mr. Hinton has.

The Witness: That was my understanding, but Mr. Culton spoke up and said we would be glad to furnish that, and I brought the files on the strength of that, to give you that information.

Mr. Goodman: All right.

Just a minute, rather than consume time here by question and answer, I would prefer to see the information first.

Mr. Culton: Any time, sure.

The Witness: Sure.

Mr. Goodman: Is that all right?

Mr. Wheat: First let's get his check on the figure he quoted from memory, so the record will be clear.

Mr. Goodman: Yes.

Mr. Wheat: You were looking for the correct out-of-[fol. 4863] pocket cost figure. Can you give that now?

The Witness: I can tell you one thing, it is within, I would say, 10/10,000's of a cent, but I had better check it.

Well, I find that I do not have that weighted back on this page. Would it be all right if I do that at the lunch hour and give you that figure, or I will give it at recess.

It is a matter of adding these up and dividing.

Mr. Goodman: That is all right.

Mr. Littman: What page of your working papers are you referring to?

The Witness: This is not a working paper. It is the estimated cost of gas at well head, 1942. It is a budget file that Mr. Goodman requested.

Mr. Littman: Those papers and that file were not turned over to the staff of the Commission with your working papers?

The Witness: No, sir.

Mr. Littman: May I see that table for a few moments?

The Witness: Yes. It is not weighted back there, as I thought it was. I usually do that.

. . . . . .

[fol. 4864] The Witness: The figure was 1.8709.

Trial Examiner: Now, so that your answer may be complete, will you state what that figure is?

Mr. Littman: That is 1.8709 cents?

The Witness: Yes, per M.c.f., that figure being the amount of money which is paid for royalty and for the gas purchased.

It is a combination of those two. The figure that I gave from memory was in error, due to the fact that we have increased our royalty rate from 4 cents per M.c.f. to 4½ cents, the past year.

By Mr. Goodman:

Q. Mr. Hinton, you have produced a folder of papers and you have indicated that you intend to present to me [fol. 4865] that folder of papers in compliance with a request of mine. A. Yes, sir.

Q. Now, will you state the request which you consider that that folder complies with?

Mr. Culton: We submit that is highly improper interrogation, Mr. Examiner.

Trial Examiner: I assume what Mr. Goodman is asking for is a definite statement by Mr. Hinton as to what this folder contains. Is that not true?

Mr. Goodman: Well, this folder is presented in compliance with a request.

Now, I want the presentation to have a purport and the witness to state the purport of the presentation, rather than to deal with some generalty.

In other words, I want him to state his understanding of the request which the presentation complies with and the nature of the folder itself.

Mr. Culton: We submit that it is improper interrogation, Mr. Examiner.

The Witness, as the Examiner has suggested, can state exactly what the folder is.

Mr. Goodman: No.

Trial Examiner: The record will show that almost exactly, I think, but I think now that Mr. Hinton should state just what this folder is and we know that this folder [fol. 4866] and its contents have been offered to Mr. Goodman for his examination.

The Witness: This folder, which is titled, "Estimated Cost of Gas at Well Head, 1942", is probably somewhat in error, because——

Mr. Wheat: You mean the title is in error?

The Witness: The title is in error, because that might lead anyone to believe that the cost of gas at the well head included the cost of operation and the amortization of investment and many other things that it does not include.

What this folder does include is the amount of gas which Panhandle Eastern proposes to take from the west sweet Panhandle Field, Texas; the portion of the Hugoton Field located in the State of Kansas and the portion of the Hugoton Field located in Oklahoma.

It shows that the gas will be prorated and the amounts of gas which will be produced from each field and portion of the field and the amount which will be purchased; the unit cost showing that one-eighth of the royalty at 4½ cents and the proportion of the purchased gas which will be purchased at 2½ cents and 3½ cents plus one-eighth of the one-half cent increase in royalty which will be paid to the Shamrock Oil and Gas Company.

I believe that that describes it to the extent that you wish.

[fol. 4867] By Mr. Goodman:

Q. What was the occasion of your assembling those papers and bringing them here?

A. The original purpose of assembling these papers, these calculations, was to furnish Mr. Morton the cost of gas per month for the year 1942, and when I say cost of gas, I mean royalty and purchase price, in order that he could include that figure in his 1942 budget and know the amounts, approximately, that would be required to take care of this cost each month during the year.

The reason that this file was brought here was at your request.

Q. And what request do you refer to?

A. A request that you made during a period of cross-examination of several days ago, at which time you indicated that you would like to know the amount of money that we were paying for gas.

Q. You then say that this is in response to a request of mine to know the amount of money you were paying for gas? A. The bringing of this file here, yes.

Q. Yes, and it is offered for that purpose?

A. That is correct.

Mr. Goodman: All right.

Trial Examiner: May I ask, Mr. Hinton—it may not be necessary when the papers are examined—but I would like to have you state whether this computation involves [fol. 4868] only the cost of gas that is purchased outright, and the cost of gas on which royalty is paid?

The Witness: The royalty cost only, not the cost of gas on which royalty is paid, because it does not—

Trial Examiner: (Interposing) Well, that is true.

The Witness: It is just the royalty cost.

Trial Examiner: It is just the royalty item?

The Witness: Yes, sir, that is correct.

Trial Examiner: It does not include production costs?

The Witness: No other costs.

Trial Examiner: And it does not include data with reference to gas produced on land wholly owned by the company if there are any such areas?

The Witness: You mean, other than just the royalty on that gas? It does not include that.

Mr. Culton: What the Examiner is getting at is, I think, the fact the company does not have fee-owned land. It pays royalty on all—

The Witness: (Interposing) Yes, that is true. I am sorry, I missed your point. We do not own any land or any royalty.

Mr. Culton: Does that include what gas is produced in Local Area?

The Witness: No, this is just for the fields described.

[fol. 4869] Mr. Littman: What fields are those?

The Witness: The Local Area Field.

Trial Examiner: He has named them, Mr. Littman.

The Witness: I described them.

Trial Examiner: The Panhandle, except the sour gas area and the Hugoton in Oklahoma and Kansas. Is that not right?

The Witness: That is correct.

Mr. Littman: You totaled the costs of royalties and the cost of gas purchased in those fields.

The Witness: No. They show on separate sheets the figure which I gave of 1.8709 cents per M.c.f. applies only to the West Panhandle Field, Texas.

Mr. Littman: And that figure was obtained by totaling for that field the cost of gas purchased and the total royalty cost and dividing the sum of the two by the number of M.c.f.'s, is that right?

The Witness: The total number of M.c.f.; yes.

Trial Examiner: These papers, then, do not contain a similar computation for the Hugoton Field?

The Witness: Yes, they do, but—

Trial Examiner: (Interposing) It is separate?

The Witness: (Continuing)—but I interpreted Mr. Littman's question there to mean that this figure which I gave would apply to a combination of both fields rather than the Panhandle Field alone, and I wanted to make it clear that this does apply only to the Panhandle Field, [fol. 4870] Texas, gas.

Mr. Littman: That is, the 1.8709 cent figure?

The Witness: Yes.

By Mr. Goodman:

Q. Mr. Hinton, now the papers in this folder include all of the papers that you handed to Mr. Morton, is that right?

A. No, sir. The paper which I handed to Mr. Morton is the summary of the detail sheets here.

In other words, it is necessary to make rather extensive calculations, because we have to determine what proportion of the gas will be produced and what proportion will be purchased and when all of these calculations are made and the answers obtained, they are placed on the summary sheet, which goes to Mr. Morton, and he retains that for his budget files.

Q. And is the summary sheet in the folder too?

A. No, sir.

Q. In other words, you do not show me the summary sheet at all?

A. I show you what is on the summary sheet, but I show it by a collection of detailed sheets.

Q. All right.

Now, except for the summary sheet, the folder is complete in connection with what you gave to Mr. Morton?

A. Yes, sir, that is correct.

[fol. 4871] Cross-Examination (Resumed)

By Mr. Littman:

Q. Mr. Hinton, a while ago we were discussing the matter of securing additional gas supplies from other gas

vendors than those who are now under contract with Panhandle Eastern.

Have you even made an investigation to ascertain how much additional gas could be secured from the Panhandle Field by Panhandle Eastern from additional gas vendors?

A. In a rough sort of way, yes, sir.

Q. What did your investigation disclose?

A. That there is acreage which is under lease to other companies at this time that could be developed and probably placed under gas purchase contract.

Q. At what price?

A. It did not go that far. It is assumed that the price would be the usual purchase price of gas in the field.

Q. The usual field price: and what is the field price?

A. All the way from .6 of an M.c.f. up to 4 cents, I believe.

Mr. Wheat: Six-tenths of a cent per M.c.f.?

The Witness: Six-tenths of a cent. I believe there is some gas that sells for 6 cents down there. In the area in which we operate, the average price is 3½ cents per M.c.f., usually with an agreement in there concerning taxes and the application of higher royalty rates to apply [fol. 4872] to that price.

Mr. Culton: That is on long-time contracts?

The Witness: Yes, sir. Well, purchase contracts are usually for the life of the lease.

By Mr. Littman:

Q. And the average field price would be close to what amount? A. Three and one-half cents per M.c.f.

Q. In the Panhandle Field?

A. In the West Panhandle Field, in the areas in which we operate.

Q. Now, Mr. Hinton, can you give us an idea of how much gas you found might be available by purchasing from other gas vendors than those who are now under contract?

A. I do not recall that figure exactly. I believe it is around 11,000 acres.

Q. And approximately where was this acreage located?

A. Moore County, Texas.

Q. Can you give us a general idea of how much gas might be expected to be secured from that amount of acreage, let's say, over the same period as that which you show in Schedule 5 of Exhibit 43?

A. If you will tell me at what rate of withdrawal you want me to base it on, I believe I could tell you fairly closely. The rate of withdrawal would govern the amount of gas that could be recovered to as much as 50 percent. [fol. 4873] Q. Well, I think it would be best for you to assume the same general rate of withdrawal as that which you assumed for purposes of Schedule 5 in Exhibit 43.

A. In order to take at the same rate of withdrawal into our system, it would be necessary that we have a market increase out of the Panhandle Field that would be equivalent to the amount that we would withdraw per acre.

Q. That is the main barrier that stands in the way of your advising the company to go out and secure this additional gas purchase reserve, is that correct?

A. And after we had that—

Q. (Interposing) Is that correct, sir?

A. That is correct, yes.

Q. You see, when you nod your head, the record does not show that, and I would like to have you speak your answer into the record, if you did not.

A. I will do my best, sir. I would like to go ahead—

Q. Yes.

A. (Continuing) And tell you a bit further what would happen.

If we would add 11,000 acres to our present property and take at the same rate of withdrawal we are taking from our property, it would be necessary, in all probability, to loop the entire distance between Sneed and Liberal and add many thousand horsepower.

[fol. 4874] Mr. Wheat: Of compressor power?

The Witness: Yes.

By Mr. Littman:

Q. That is, of course, based upon the assumption that you would take it out as fast as you are taking it out and at the same rate of withdrawal as shown in Schedule 5 of Exhibit 43? A. Yes, sir.

Q. And if you did not take it out that fast, you would not have to necessarily construct these additional facilities to which you have referred?

A. But if we did not take it out that fast, we would not recover the same amount of gas which is connected to our system at the present time, because by retarding that withdrawal, it would mean that we would not meet the average of the field and, therefore, there would be a migration of our gas to other portions of the field.

Q. In other words, you would not get all of it?

A. We would not be protecting our reserve.

Q. But you would get a substantial part of it?

A. We would, in all probability, get a substantial part of it, but the cost per M.c.f. would go considerably higher than it is under the plan we have set forth.

Trial Examiner: Is the drainage factor different in the [fol. 4875] Panhandle Field from what it is in the Hugoton Field?

The Witness: Yes, sir.

Trial Examiner: In what way?

The Witness: First, by the total withdrawal from the field and, secondly, that the Hugoton Field is a tighter formation of less thickness and migration of gas in that field is not as free as it is in the more porous Panhandle Field with the greater thickness through which it can travel.

Trial Examiner: Reference has been made to a development in the Hugoton Field involving the drilling of one well per square mile as a means of removing all of the commercially profitable gas.

Is that same rule true in Panhandle?

The Witness: I would say that it would be easier to drain a square mile in the Panhandle Field, Texas, by one well than it would in the Hugoton Field.

Trial Examiner: Because of the freer migration of the gas?

The Witness: That is right, the permeability being higher there.

Now, the reason I say that, is due to the fact that I have spent many hours studying the reaction of wells blown into the atmosphere and studying the length of time that is required to build up the pressure and the Texas wells show that they are far superior in permeability, the Texas formation to the Hugoton, Kansas, formation.

[fol. 4876] Trial Examiner: Are you able to state whether or not the competitive area of the Panhandle Field where wells of competing companies are rather close to each other, whether there has been difficulty in those competitive companies taking their requirements that have been marked or outstanding?

The Witness: Do you mean daily requirement or annual requirement?

Trial Examiner: I was thinking of total recovery from a given area.

The Witness: Yes, total recovery, there has been and probably always [—] be that trouble.

Trial Examiner: Will you give us some further light on those competitive factors; why you are in close competition?

The Witness: It is felt that the close competition to all producers of sweet gas is the sour gas field which is located in the northern part of Moore County, where the withdrawal per acre is more than twice what it is in the sweet field, and the recent pressure maps indicate that the withdrawal is beginning to be felt in the sweet gas area.

Trial Examiner: In other words, the sweet gas is migrating into the sour gas area from which the gas has been rapidly withdrawing?

The Witness: The pressure maps indicate that that is what is happening.

[fol. 4877] Trial Examiner: These factors you have now described are related to the prediction that the Panhandle Field will be less long-lived than the Hugoton Field.

The Witness: That is correct, yes, sir.

By Mr. Littman:

Q. Now, Mr. Hilton, I do not believe that you have yet answered my question as to the approximate amount of gas that you would expect to recover from these 11,000 acres owned by gas vendors, assuming the same rate of withdrawal as that shown in your Schedule 5 of Exhibit 43 and assuming the facilities which you assumed are required to carry the gas to the market?

A. Well, before I make an answer to that question, I would want to get that acreage, see where it is located, see what development has taken place immediately around the acreage, and to examine some of the logs in that vicinity, because to just make an answer to that problem without giving it consideration could run into errors that would be far beyond approximate.

In other words, it is not a question that can be covered just offhand.

Q. Well, Mr. Hinton, I understand that no such estimate as that which I have asked you to make would be exact, but I thought you might give us some general idea.

It would be a substantial amount of gas, would it not? [fol. 4878] A. Yes. If you want to assume a figure, why, say 10 million an acre. That is a good, round figure.

Q. You mean that would not be an unreasonable figure to assume?

A. Not if that acreage is located where I remember it. It could be an unreasonable figure if that is farther to the margin or around areas in which there are a show of water in the wells at the present time or around which small wells have been developed.

Q. Do you mean 10 million M.c.f. recovery per acre?

A. Yes. After all, that is just an assumed figure, but probably not unreasonable.

Q. It is an assumed figure, but the figure you gave me was the total recovery figure, was it not? A. Yes.

Q. And to the best of your ability with the information that you have at hand and your general knowledge of the field, the 10 million M.c.f. figure is your best judgment of the amount of gas that would be expected to be recovered from these 11,000 acres? A. Yes.

Q. Now, when did you last make an investigation of the amount of purchased gas that might be available to Panhandle Eastern?

A. It has been some time. It is just a knowledge that [fol. 4879] you get of the field by being around it.

You know that there is a certain amount of available acreage. It is possible that it could all be under contract at this time, but I still believe that there is about that much.

Q. Available? A. Yes.

Q. To Panhandle Eastern?

A. I would imagine that we could probably make a contract for it if we so desired.

Q. Now, the 11,000 acres of gas acreage which is available to Panhandle Eastern is that which is in the immediate vicinity of Panhandle Eastern's present acreage, is that right? A. Fairly close, yes.

Q. Now, there is additional acreage available out further and beyond that locality, is there not?

A. Yes, there is a great deal of marginal acreage which will probably never be drilled at all.

Q. Well, isn't there other acreage available that is owned by individuals that would be willing to sell gas?

A. I am not sure about that because I have not been concerned about that.

Q. You have not made an investigation of that?

A. No.

Q. In other words, you have not made an investigation of how much gas is available for purchase in the entire Panhandle Field?

[fol. 4880] A. No, because it would not be a sensible thing to do from the standpoint of our company.

Q. You are primarily interested in the acreage close to your lines at this time, is that right?

A. We are concerned in getting the greatest amount of gas from the Panhandle Field that can be obtained under the proper economic development.

Q. Now, the economic picture may change very rapidly, may it not?

A. Well, it may. It hasn't in the past several years but, of course, there are lots of things that are changing now quite rapidly.

Q. I think we can all agree on that.

The economics, to use your term, of operation in the Panhandle Field may be entirely different ten years from today than it is today, isn't that correct?

A. That all depends on what happens to the rate of withdrawal.

Q. And nobody is any too sure about the rate of withdrawals either, are they?

A. No, not too sure, but our daily report of last week showed that the daily withdrawal from the Panhandle Field was about 74 million per day greater than it was a year ago for pipe line use only.

[fol. 4881] Q. Well, the economics which you have been interested in are primarily those of today, are they not?

A. No, I would say they are those of today and of the next several years.

Q. The immediate future? A. Yes.

Q. How far into the future?

A. I would say, at least ten years.

Q. Did you make a detailed study of the advisability and the economy of acquiring any part of these 11,000 acres under gas purchase contract?

A. I do not recall making a study of that particular thing, no. We have made a great deal of studies on the connection of gas purchase acreage, and I would say that we have connected probably more distress gas wells than any other one company that operates in either of the fields.

Q. In other words, you have not made such a—

Mr. Culton: (Interposing) Would you mind letting him explain what he means by "distress gas wells"? That is a term that he and I know the meaning of, and you gentlemen probably do, but the record does not show it.

The Witness: A distress well is a well that is owned by a man who thought he could get a market when he drilled and later found he was unable to get a market and rather than let that develop or stay there with that investment in it, the company entered into a gas purchase [fol. 4882] contract with the producer.

Trial Examiner: Usually at a very advantageous price?

The Witness: No, I would say that it would be the average of the field.

Mr. Culton: Some of them have been more advantageous than others, though?

Trial Examiner: In other words, there is a commercial factor that enters in?

Mr. Culton: Of course, we would not purport to do it and lose money, would we?

The Witness: We have lost a great deal of money by connecting those wells.

Mr. Goodman: I thought the term "distress well" indicated that relief of distress was a big-hearted gesture.

The Witness: And that is exactly what I would say was meant.

Mr. Culton: Complete your answer. You had started to answer the question as to the cost to the company.

The Witness: That same thing would happen if we would connect those 11,000 acres we are discussing at this time. That would cost our company many thousand dollars to go in and connect that acreage.

By Mr. Littman:

Q. And the primary reason why you do not step in and [fol. 4883] acquire that acreage is simply because you do not, at this time, have the market for it, is that correct?

A. That is correct.

. . . . . .

[fol. 4884] By Mr. Littman:

Q. Mr. Hinton, you have from time to time referred to figures which represent production-per-acre figures. Will you state whether or not you have at hand the production-per-acre figures that you used in arriving at your estimates in Exhibits 42 and 43? Perhaps before giving us those figures you might define what you mean by the term "production-per-acre".

A. It is the number of m.c.f. produced per acre per year.

Q. Throughout the entire field?

A. Oh, of course, that is an average. That doesn't mean taking into consideration the certain number of feet away from the well bore that a certain number of m.c.f. is produced from and declining that on out from the well bore, but what it does mean is the number of acres under lease and it does not mean the total withdrawal area of any well.

Q. Well, in your previous discussions you have stated that you, at various times, compared the production-per-acre figures of Panhandle Eastern's acreage with that of all operators in the Panhandle field.

A. Yes sir, I have, but I do not have those figures with me.

Q. Do you know what the average for the entire Panhandle field was in 1941, for instance?

[fol. 4885] A. Offhand, I do not,—I can tell you,—for the year 1941, because the total production figures are not yet tabulated. That is obtained by an exchange between companies and the data from the Railroad Commission, and that is not yet out for the year 1941.

Q. Do you recall the figure for the year 1940?

A. I do not, but I can furnish that figure to you.

Q. Well, suppose you supply the figure for the year 1940.

A. Now then, when you asked for that figure, did you want it for the entire Panhandle field, did you want it for the west Panhandle field, or did you want it in the areas in which we operate and that, in my opinion, is the figure that should be used?

Q. Well, is that the one that you used, the latter one?

A. Yes, sir.

Q. What we want is the figure that you considered, so we will ask for the latter character of figure.

A. The latter figure, however, is governed by the overall picture of the field, that is, the sour gas must be taken into consideration on that, not as a figure to show what the withdrawal is in these particular areas, but to show what is happening to the entire field in order that we can forecast what the influence of this heavier withdrawal from the sour gas area will be upon the areas in which we operate.

. . . . . .

[fol. 4888] Q. Mr. Hinton, be more specific with reference to the production-per-acre figures. You testified that you used certain production-per-acre figures to arrive at the figures shown in Schedule 5 of Exhibit 43. I would like to know what those figures are. You are now showing me the page of your working papers?

A. That is right. That is File No. 39. It is a group [fol. 4889] area summary and it shows the number of wells that had been drilled up to July 31, 1936 and on down through July 1941 in each area. It, also, shows what the withdrawal from each of these areas had been for those years and it shows what the withdrawal per acre in each of those areas had been.

Now, the only thing that I don't have here to furnish for your information is what the withdrawal from the Panhandle Eastern acreage has been through those years compared to this and I have it somewhere, but I thought it would be in the folder here. It is possible that I worked it out and did not place it in these folders, but I have data here so that I can readily work that out and furnish it to you.

Q. Well, these areas to which you have referred are the areas in which the Panhandle Eastern production system is located.

A. That is correct, and is shown on an exhibit,—I don't know what number,—but it is a group area map.

Mr. Culton: I think it is 44, I am not certain.

The Witness: It is either 44 or 46.

Mr. Wheat: Just a second, we will get that.

Trial Examiner: 46.

Mr. Culton: That is right. I have checked on it.

By Mr. Littman:

Q. Now, what is the source of the data shown in your [fol. 4890] working papers, File No. 39? A. Yes.

Q. Which shows the summary of withdrawals and acreage by group areas in the Panhandle field?

A. The records of the Railroad Commission, located at Pampa, Texas.

Q. And does it include all of the acreage line within the various groups termed "A" to "G", inclusive?

A. Yes, all within the boundary lines of those group areas.

Q. That is acreage owned by the others as well as Panhandle Eastern?

A. All acreage, regardless of the owner.

Q. And all wells? A. And all wells.

Q. What effect did you give, in arriving at your conclusions in Exhibit 43, to the average production per acre throughout the entire west Panhandle field?

A. I only gave consideration to these group areas as governed by the total west Panhandle field, also, the east sweet field and the west sour field. We operate in a certain portion of the west sweet field and the group areas there are so divided as to give us like operating conditions in each of those areas. Now, if we would only take the areas as outlined there, and not give consideration to the outlying portion of the field, why, we would get an an- [fol. 4891] swer which would not be even close to approximately right.

Do I make myself clear?

Q. No, you don't, Mr. Hinton. Perhaps if you would elaborate on that a little we would follow you better.

A. I believe the best way to explain that would be to put up your group area map.

Q. Exhibit No. 46? A. Exhibit No. 46.

Q. Very well.

Mr. Culton: Do you have your copy with you?

The Witness: I didn't save one.

Is there an exhibit here that shows the outline of the Panhandle field of Texas?

Mr. Littman: Yes, Exhibit 75 or Exhibit 76. I think Mr. Davis' exhibit contains a small map.

Mr. Culton: I think it would be better to use the latest rock pressure map. It probably has more of the things you want to talk about on it, the 1940 rock pressure map.

Trial Examiner: That is Exhibit 26.

The Witness: Now, in determining what is the proper procedure to take, from the standpoint of the Panhandle Eastern Pipeline Company, in finding out what our rate of withdrawal should be from its acreage in the Panhandle field, we weigh like areas as nearly as possible with what is happening in general in that area. In other words, we [fol. 4892] have in the group "A" a group of 15 company wells.

Trial Examiner: You are referring now to Exhibit 46 for identification?

The Witness: Yes, sir.

Now, we know that by looking at the pressure map over here, which is Exhibit 26, this general area which is covered by group "A" lies in the eastern portion of the west sweet field and that the pressure gradient from the north part to the south is 250 pounds. Therefore, we know that in the short space covered by this group there is going to be a decided migration of gas from this area into the areas of lower pressure.

Mr. Culton: May I suggest that you explain, for the purposes of the record, what you mean by a pressure gradient of 250 pounds.

The Witness: The difference of the maximum and minimum pressures that prevail in that area.

Trial Examiner: I think it might be well also, Mr. Hinton, for you to explain the relationship of the area to which you now refer in your group "A" to that area of development for the production of oil extending, roughly, from Pampa to Borger on the border line of this pressure zone, which you have referred to.

Mr. Culton: I suggest, also, in that same connection [fol. 4893] that we show the relationship to the sour gas area.

The Witness: The area immediately east and to the north, cutting out the northeast corner of group area "A", is an area of long-term oil production and that, in all probability, accounts for a large part of the gas that has been produced, of which a large part of it has not been

metered, that has caused the low pressures to the northeast side of "A".

Now, "A" is the easternmost area of the general area in which Panhandle Eastern has development. Now, we come over to area "B" and we find a situation that is altogether different; that is, it might be well to tell how many wells are located in area "A" at the present time, as of July 31, 1941 there are 98 wells.

By Mr. Littman:

Q. And those wells are owned by not only Panhandle Eastern, but the others? A. That is correct.

Q. And other producers? A. And other producers.

Now, we come over to group area "B" and we find a decidedly different situation. That is, there are not many wells in that portion of the Panhandle field and the rate of withdrawal is now about the same as it is in "A"?

Mr. Culton: You mean the rate of withdrawal per acre?

The Witness: Per acre, but the difference in pressure [fol. 4894] in the two areas shows that there is a far greater amount of gas remaining in group area "B" than in group area "A".

Mr. Culton: Is there as great a pressure gradient in "B" as there is in "A"?

The Witness: No, the pressure gradient in "B" is 100 pounds.

Going up to area "C" we, again, come very close to the oil development—

Mr. Culton: (Interposing) Where is the oil development with respect to "C"?

Pardon me for butting in, Mr. Examiner, but I thought I might help him elucidate that.

Trial Examiner: I will appreciate it if you will watch those answers and see that they develop the facts fully in connection with these statements.

The Witness: Will you please read my answer?

(Whereupon, the last answer was read by the reporter.)

The Witness: (Continuing) Which lies to the northeast border of "C" and, in fact, I believe that there is oil production within a very few miles east of "C" to the northeast and there are a few oil wells which do not show on this map that are located in the extreme east edge of area "C" just to the north of the Canadian River.

Area "C" is an area which suffered a great deal of drainage during the time when gasoline plants were operating and the gas was blown to the air. There is no [fol. 4895] way of telling exactly how much gas has been produced from that area, but, again, we encountered lower pressures in "C" and the general history of that area shows that the average well drilled in this portion of the field has a much sharper pressure decline than those in area "B".

Mr. Culton: What is the pressure gradient of "C", approximately?

The Witness: About 150 pounds, that being from 200 to 350.

Now then, we come up to area "D" here, which has considerable development for the size of the area, there being 19 wells and the total acreage in "D" being 19,763 acres. The rate of withdrawal from "D" is comparatively light, yet we find that there is a low-pressure area that is coming in from "D", apparently, from the sour gas area.

Although this is not connected yet, I believe that next year's map will show that this low-pressure area coming down into "D" is coming from, not only the southern part of the sour gas area, but up further withdrawal is much heavier. For that reason the life of "D" would be less than in the area of "B" where there is less development, less migration. The migration in "B" can be only to the east. In "D" it is up where the withdrawal per acre is approximately twice what it is in this total area in which we operate.

[fol. 4896] Mr. Wheat: You mean toward the northwest?

The Witness: Yes.

Mr. Culton: What kind of production is coming from the northwest?

The Witness: Sour gas.

Mr. Culton: There is another sour gas area up to the northwest of "B", then?

The Witness: This is all sour gas.

Mr. Culton: That is what I wanted you to bring out.

The Witness: In fact, these two wells here which are owned by the King Oil Company and which are now connected to our line, at one time were pronounced as sour wells.

Mr. Culton: That location is near the north boundary line of "D" and "C".

The Witness: That is correct and just south of Sneed compressor station.

They do contain a slight amount of sulphur at this time, but not enough to keep them out of the sweet-gas class.

We come on down to area "E" here, which is an area of lighter development yet than "D" and is bordered on the south by acreage which is owned by the Canadian River Gas Company, which is only in a small part developed in comparison to the general development of all companies in the Panhandle field.

Now, the areas of "F" and "G" are, again, threatened by the sour gas area to the north and by the fact that the [fol. 4897] Texoma Natural Gas Company has shifted production from the low pressure area to the east of the field over into this area.

By Mr. Littman:

Q. By "this area", you mean "E"?

A. "F" and "G", and have carried on intensive drilling campaigns. The rate of withdrawal from both "F" and "G" will undoubtedly increase to a large degree within the next two or three years.

Now then, in this study when we weigh the total withdrawal of these companies, we not only take into consid-

eration the present rate of withdrawal, but we also determine how many available locations are remaining and at what pressures they can extract on these wells. Therefore, we can fairly well determine what the shift of production from one area to another will be and that is considered as well as the past rate of withdrawal.

Now then, I wonder if I have made myself clear.

By Mr. Littman:

Q. Can you read into the record at this time the rates of withdrawal for each of those areas for, let us say, the year 1941 or 1940?

A. Either one that you want.

Q. Suppose we have both.

A. The rate of withdrawal from area "A", which consists of 74,893 acres for the year 1941, was 573 m.c.f. per acre; from area "B", which consists of 31,309 acres, the [fol. 4898] rate of withdrawal was 553 m.c.f. per acre.

Q. Mr. Hinton, are those for the calendar years 1940 and 1941?

A. Yes, sir. All Railroad Commission figures are calendar-year figures.

Q. From January 1 to December 31?

A. Yes, inclusive.

Q. Of 1941?

A. No. These are mid-year figures. I should have put that mid-year in there earlier, but if you think it best to repeat it, I will. Withdrawal figures that have been read are from August 1 to July 31, inclusive.

From area "C", consisting of 65,901 acres, the rate of withdrawal for 1941 was 590 m.c.f. per acre; from area "D", consisting of 19,763 acres, the rate of withdrawal was 361 m.c.f. for 1941; for area "E", consisting of 39,059 acres, the rate of withdrawal for 1941 was 560 m.c.f. per acre; for the group area "F", consisting of 31,475 acres, the rate of withdrawal for 1941 was 609 m.c.f. per acre; for the area "G", consisting of 32,685 acres, the rate of withdrawal was 518 m.c.f. per acre.

Mr. Culton: For the purpose of clarification, that is for the term August 1, 1940 to July 31, 1941?

The Witness: That is correct.

[fol. 4899] Mr. Culton: All right. Now, your other figures are from August 1, 1939 to July 31, 1940?

The Witness: What are the figures?

Mr. Culton: I thought you were going to give the two years. Didn't you ask for both, the two years?

The Witness: Did you want the two years?

Mr. Littman: I want those for the preceding year.

Mr. Culton: That would be from August 1, 1939 to July 31, 1940, wouldn't it?

The Witness: Yes.

Well, it will not be necessary to call those acreages again, will it?

Mr. Littman: No, let me make this suggestion, Mr. Hinton, would you mind preparing a table which will show the production per-acre figures that are included in your working papers?

Mr. Culton: Couldn't he just add those seven figures to this and he will have it in the record all in one place. If he now gives that from the summer of 1939 to the summer of 1940, you will have it all there.

Mr. Littman: Yes, but you have other years, do you not? Your study includes what years?

The Witness: From August 1, 1935 to July 31, 1941, inclusive.

By Mr. Littman:

Q. I see. Now, do you have a breakdown of those [fol. 4900] figures, which would show the production-per-acre of Panhandle Eastern's acreage?

A. For those years?

Q. For those years.

A. No, I will have to prepare that because it would be in this file if I had it, because this is a group area summary file.

Q. You have heretofore made such a study, have you not? A. Yes.

Q. Will you prepare a statement for each of these years, 1935 through 1941, showing both the production-

per-acre figures for the Panhandle Eastern's own acreage and for the total acreage in each of the sections of areas?

A. I think that would probably be a very good idea, because there is one thing on the summary of these group areas that I think should be brought out and that is to show that the recovery or withdrawal per acre has practically doubled from July 1935 up to July 1941 in these areas. I believe that I would like for you to have that, so that you will understand that there is a problem there in keeping in step with the general change of the rate of withdrawal in these areas.

Q. Very well. We will appreciate it if you will furnish us such a statement, Mr. Hinton, at your earliest convenience.

Now, how did you apply and use those figures of withdrawal per acre in arriving at the figures shown in Sched- [fol. 4901] ule 5 of Exhibit 43?

A. By the information that was assembled it was possible to show approximately what pressures we would be able to expect in each of these group areas through the various years. The pressure, of course, is the key to the amount of gas that a well will deliver into the pipeline system.

Q. Now, can you give us a specific example of how you applied the figures of withdrawal per acre in arriving at this? Did you make a mathematical calculation?

A. Yes, I have made many mathematical calculations.

Q. Now, for instance, let us say, in one of those areas you had an average withdrawal for the year 1939-1940 of, let us say, 500 m.c.f. Now, what did you do with that figure? That is what I am trying to find out.

A. I took that figure and applied it to the number of acres that we had and from that answer I could tell whether we were in step with the field, whether our rate of withdrawal per acre was high or whether it was low.

At the same time I kept in mind that up to date we had not obtained as much gas for the pressure drop in our acreage as had been obtained from the field as a whole. Therefore, that threw us behind in what we should have obtained for the present field pressure. In keeping that

in mind it is my intention to reverse migration of gas eventually, that is gas that has formerly migrated from [fol. 4902] our leases to others, to take a rate of withdrawal that it will enable us to take because the flow will be reversed and we will get back what we have lost to date.

Trial Examiner: Is there a prospective development for oil which might affect your future problem in this regard?

The Witness: Not in the Panhandle field. In the Hugoton field there is a prospect.

Mr. Culton: These areas have already, heretofore, been tested?

The Witness: Yes. Now, there are new wells going down in proven areas.

Mr. Culton: But other areas than these, "A" to "G"?

The Witness: They are well defined.

Mr. Culton: That is the question the Examiner had in his mind, whether these particular areas have already, heretofore, been tested for oil and found non-productive.

Trial Examiner: And we might add to that inquiry whether or not the gas is being processed for casinghead gasoline as actively as it was in the past years or in the earlier development of the former Pampa field.

The Witness: No, my remembrance is that it was only a small part of what it was originally.

Trial Examiner: Does that affect your problem, that fact?

[fol. 4903] The Witness: Yes, it does in this respect, that if there were, at the present time, being the same amount of so-called casinghead gas processed as there was in former years, why then our expectant recovery would be diminished by the volume that was being processed. You will note that I named that "so-called casinghead gas".

Trial Examiner: Yes. Does the rule of practice of the Texas Railroad Commission in any way affect that sit-

The Witness. It does.

Mr. Culton: In what way? Explain that.

The Witness: The gas-oil ratio has been set. That was formerly neglected.

Mr. Culton: In other words, formerly there was no limit to the amount of gas to be produced with one barrel of oil, whereas now there is a limit?

The Witness: That is right. I think they have done a very good job on their gas-oil ratio work.

Trial Examiner: Well, that is tending to conserve your reserve?

The Witness: That is correct.

By Mr. Littman:

Q. Mr. Hinton, who drew the boundaries of these group areas referred to as "A" and "G", inclusive?

A. I did.

Q. And what governed the establishment of those [fol. 4904] boundaries?

A. Two things, areas of like operating pressure on the pipeline system and areas of like productive areas, that is, wells of similar size.

Q. Yesterday we were discussing the so-called principles and assumptions upon which you based your study, comprehended by Exhibits 42 and 43. One of these is No. 5, which appeared at the bottom of page 6, entitled, "As the Panhandle Field Declines the Company must look more and more to its reserves in the Hugoton Field".

Now, on page 7 you make the following statement: "The Panhandle field will not be a one-horse shay; it will not suddenly cease producing, but in my opinion its decline in productivity will be an ever-increasing rate."

Will you tell us what you mean by that statement?

A. I mean by that statement that we take the data on the field, that is the pressure records, and the amount of gas that has been withdrawn, and we find that there is a tendency there that when we apply the weighted average pressure of the field to the amount of gas withdrawn

er number of pounds to produce the equivalent amount of gas.

Q. Now, looking at Schedule 5 of Exhibit 43, again, I thought perhaps your statement had reference to the fact that Panhandle Eastern, for example, was not going to be able to produce as much gas in the latter part of the [fol. 4905] 15-year period as in the first part of the 15-year-period shown in that schedule.

A. Yes sir, I believe the schedule showed that quite clearly.

Q. And that is what you had reference to, that kind of performance?

A. No, I mean that where a well in this area is now producing, say, a million-feet-per-pound drop, just for example, that as the field further declines it will take two pounds to produce that same million.

Mr. Culton: A two-pound drop?

By Mr. Littman:

Q. Well now, speaking of the time elements, what would you say with respect to the time required to get the gas out in the latter period as compared with the present period?

A. It would take a great deal longer.

Q. In other words, you had that in mind as well as the increase in the drop of rock pressure per unit of gas produced?

A. It will take a great deal longer and it will be impossible to obtain the same amounts, because it wouldn't be there to obtain.

Q. Well, even if it is there to obtain, I understand your testimony to be that it will take a longer period of time to produce it.

[fol. 4906] A. That is correct, Mr. Littman, it will.

Q. In the latter period than in the former?

A. Yes, sir.

Q. And is that true, generally, of gas fields whose life has expired and whose performance can be viewed in retrospect?

A. With the exception of a gas field that has a water or oil drive.

Q. Well, there is no such thing present in the Panhandle field, is there?

A. No, but answering your question as to all gas fields, yes, they would have to be included.

. . . . . .

[fol. 4907]

C. H. Hinton, a witness, having been previously duly sworn, resumed the stand and testified as follows:

Cross-Examination (Continued)

By Mr. Littman:

Q. On Page 7 of your Exhibit 42, you state the following so-called principle and assumption:

"The Panhandle Field is a highly competitive one and one of varied producing characteristics," do you not?

A. Yes, sir.

Q. On that page, you state that "a production engineer charged with the duty of obtaining from his company's reserves production of given volumes at any time is faced with many major problems, particularly is this true in the Panhandle Field."

Why is this particularly true of the Panhandle Field and what do you mean by that statement?

A. In order to obtain a given volume at a given time, it is necessary that development must be carried on that is considerably in excess of the average daily requirement for the company and the fact that it is necessary to develop and drill wells in excess of the average daily requirement with a load factor similar to the one of Pan-
[fol. 4908] handle Eastern, it means that so much acreage must be developed that it is difficult to compete with the withdrawal of other companies with higher load factors.

Q. Is that condition one that is peculiar to the Panhandle Field?

A. Yes, I would say that it is, for this reason;

That the heaviest withdrawal is taken by pipe line companies and the carbon black industry, all of which

have a load factor much higher than Panhandle Eastern load factor.

Q. Now, is it your plan, Mr. Hinton, to so operate your production system so that you will receive in the future at least the share of the reserves in the field as are represented by Panhandle Eastern's holdings of acreage in the field?

A. Yes, at least that amount and, desirably, greater amounts.

Q. As you indicated this morning, you are going to endeavor to get more than your share and expect to do so?

A. Not more than our share over the entire picture, but more than our share if production would be started from the field as of June, 1941.

In other words, in this field if the development were just starting and there was a uniform spacing program in the field, then we would expect only to withdraw at a rate that would compare with other withdrawals, but in the past, we have not withdrawn at that rate.

[fol. 4909] Therefore, our recovery has, to date, from that field indicated that we have a reserve that would be far less than the one that is estimated.

That is, if our reserve would be computed today on a pressure decline base for the amount of gas that has been taken by this company in comparison with the pound decline in the field, why, our indicated reserve would be considerably less than it is.

For that reason, we feel that we have not had our share to date and by stepping up our production to a rate that will be higher than the average of the field, we hope to get back that which we have not gotten up to this date.

Q. Do you agree with testimony of Mr. Rufus Smith, to the effect that Panhandle Eastern's acreage is located in the better portion of the Panhandle Field?

A. I certainly do.

Q. And you are aware, are you not, of the fact that Panhandle Eastern's wells have a 50 percent better average open flow potential than the average of the wells throughout the West Panhandle Field?

A. I do not know just what the percentage is. I know that it is higher than the average.

Q. Does 50 percent sound reasonable to you?

A. Taking the entire Panhandle Field, I would say that [fol. 4910] it would be a reasonable figure.

Q. Mr. Smith shows a comparison of the open flow potentials of Panhandle Eastern's wells with those of the wells in the field in his Exhibit 30.

The schedule to which I just referred is Schedule 5 of Exhibit 30.

I hand you that schedule and ask you whether you have seen it before?

A. I do not believe I have seen it in this form. I think this was taken from the annual reports of the Texas Railroad Commission, the way it is set up here. I believe that it was.

Q. And doesn't that schedule show substantially what I stated a moment ago, that the average open flow potentials of the wells of Panhandle Eastern are approximately 50 percent above those of the average of the field?

A. No, it does not show it to be quite that much, I do not believe—well, it possibly is when you would add them all up. They show to be better at least.

Q. And you would say 50 percent would not be very far off, generally, wouldn't you? Of course, it could be calculated exactly from this schedule but, for purposes of discussion, what would you say?

A. If I were just looking that over, I would say 25 percent.

[fol. 4911] However, if Mr. Smith said 50 percent, he has undoubtedly made the calculation.

Q. Well, the fact is that Panhandle Eastern's wells have a much higher open flow potential than the average of the Panhandle Field? A. Yes, sir.

Q. And what effect would that have upon the deliverability of your wells? A. On the deliverability?

Q. On the ability of your wells to produce at least as much, if not more, gas than the average?

A. It would indicate that the ability of our wells to deliver gas would be in excess of the average deliverability of the wells in the field.

Q. So that the problem of taking the gas out is not so much a physical one as it is a matter of markets?

A. Not in 1941 or 1942, it is not.

Q. You mean my statement is not correct?

A. I mean it is correct for the present and for the next three or four, I do not remember, six or seven years, probably, but after that time, then it would not be correct, because the problem of getting the gas out would then enter into the production angle.

Q. How?

A. Because the wells would no longer be capable of [fol. 4912] delivering the desired amount of gas.

Q. Well, the wells throughout the field would suffer the same fate, would they not, with respect to ability to produce gas? A. No, sir, they would not.

Q. Why?

A. Because a large part of the gas taken from the Panhandle Field goes to pipe lines that are so designed that they can operate at much lower pressures than our operating pressures, or to the carbon black industry, where it is possible to operate at comparatively low pressure and, of course, the working pressure at the well head governs the amount of gas that that well will deliver, so, if our system was designed so that we could operate at 100 pounds lower pressure or if we had a local market so we could operate at, say, 200 pounds lower pressure, our development problem would be entirely different than it is.

Mr. Culton: Suppose you explain what you mean by "working pressure". I do not think that has been explained in the record.

The Witness: The working pressure is the back pressure against which a well produces gas.

Mr. Culton: In other words, it is the pressure in the gathering line?

The Witness: In the gathering line, or the critical flow [fol. 4913] prover or whatever the apparatus might be upon the well.

By Mr. Littman:

Q. Well, one of the reasons why you suggest the capital expenditures detailed in Exhibit 42 is for the purpose of

reducing those pressures so that you may be enabled to increase your withdrawals?

A. That is correct. If we did not make that capital expenditure, then it would not be possible to take the amounts of gas that are set out in Schedule 5 of Exhibit 43.

Q. Now, when you have made the capital expenditures and installed the facilities contemplated by Exhibit 42 under the anticipated load, you will then be withdrawing at least, if not more than, your prorata share of gas in the field, will you not?

A. Well, until such time as the pressure in the field declines to the point where it is possible for the short distance local market pipe lines and the carbon black industry to go ahead and take their present rate of withdrawal, but at such time it will no longer be possible for us to go ahead and take our present rate of withdrawal without spending tremendous sums of money to increase our capacity to the point where we will be able to operate wells at a comparable pressure.

Q. When do you expect that to occur?

A. I think that we will have a drop-off in our deliverability to the point where we will no longer be able to maintain 60 billion a year, about 1948.

[fol. 4914] Q. Then in 1949 you would expect to withdraw 55 billion cubic feet from the Panhandle Field?

A. That is right.

Q. Then 50 billion in 1950? A. Yes, sir.

Q. Then 45 billion in 1951? A. Yes, sir.

Q. And so forth, isn't that right. A. Yes, sir.

Q. As shown by totaling Columns B and C in Schedule 5 of Exhibit 43?

A. Of course, that does not mean that that will be to the M.c.f. as set out there, because it would be impossible for anyone to make that accurate an estimate of what can be withdrawn, but I do believe that those will be fairly close to the figures which we will experience.

Q. Now, on Page 9 in your written testimony set forth in your Exhibit 42, you make the statement at the end of the first paragraph as follows:

"It is doubtful whether the true equilibrium pressure has ever been ascertained at any date subsequent to the time production was first commenced."

Why is that a fact?

A. The application of known mathematical formulas [fol. 4915] applied to equilibrium pressures would not give the result that we obtain by that application on the weighted pressures which we have.

Q. Now, what particular equilibrium pressures are you referring to here in this statement? Those of the Texas Commission?

A. Yes, sir, those are the Texas Railroad Commission's annual weighted pressures as shown on their pressure maps and published in the annual reports.

Q. And, in your judgment, those are not absolutely correct and true equilibrium pressures?

A. I feel that they are as true and correct as it is possible to get an equilibrium pressure on that field, taking into consideration the well spacing and the distance between wells.

Mr. Culton: Mr. Littman, I think it is fair to the Railroad Commission to state that they do not contend that those weighted average figures represent the equilibrium pressure.

Mr. Littman: I so understand, Mr. Culton, and I wanted the record to be clear.

Mr. Culton: Yes.

Mr. Littman: That it was not necessarily a matter of any errors on the part of the staff of the Texas Railroad Commission but, by reason of the inherent nature of the problem itself.

Is my statement generally correct, Mr. Hinton?

[fol. 4916] The Witness: Yes, I am glad that it was brought out that no criticism was being made of the Texas Railroad Commission.

By Mr. Littman:

Q. Well, can you state what isobaric intervals are used by the Texas Railroad Commission for purposes of determining the equilibrium pressure?

A. Yes, sir. The isobaric interval used on the annual pressure maps is 50 pounds.

Q. And, of course, those are the ones that you used?

A. Yes.

Q. Isobaric intervals of 10 pounds would be more accurate, would they not?

A. It is all according to what scale map you were working on.

Q. All things being equal, Mr. Hinton?

A. All things being equal, I think there would be a slight advantage there to use the 10-pound interval, although I have tried it in several cases on 20 pounds against 50; and the results are very close, because when you start to draw your 10-pound or your 20-pound interval, you are still at a loss to know where that line should be drawn.

Q. But all things being equal, you would get a more exact result by using the 10-pound isobaric interval, would you not?

A. Well, possibly a slightly more accurate result, but I [fol. 4917] do not think that the increase in accuracy would be worth the extra work.

Q. Now, will you state briefly the reasons why the true equilibrium pressure cannot be obtained for the Panhandle Field? I believe you undertook to do that but I do not think you gave us very much detail on that subject.

A. I do not think that it can be reached, because no one knows what lies away from the well bore, any more than the result of production indicates and, in order to reach a true equilibrium pressure, it would be necessary to know exactly where the pressure line would be placed and the reason that an equilibrium pressure is difficult to reach in the Panhandle Field is due to the fact that there are, in many cases, several thousand feet between wells, some of it running into miles, and it all depends on what the pressure is in that area between the wells, how much the pressure gradient is before it is possible to draw in a pressure contour line correctly.

The fact that there is the great variation in pressure from one edge of the field to the other governs the rate of flow of that gas from areas of higher pressure into areas of lower pressure that will work very closely on the ratio of the difference of absolute pressure squares.

That is, if we have an area of 400 pounds and we square that down to 300 pounds, the difference in squares between 300 and 400 pounds will be approximately the same as the [fol. 4918] difference in the squares between 300 and 250 pounds.

I do not know, I haven't worked them out, but it will be approximately that. Therefore, the rate of migration is governed by the pressure and in drawing in the pressure contours, it will be necessary that every bit of this information be taken into consideration.

However, regardless of the care that you give the application of the theory of the difference in squares, it still would depend upon the formation and unless you knew exactly that we had the same permeability, we would still have a problem confronting us, which we do.

Q. Now, Mr. Hinton, on the next page, namely, Page 10 of Exhibit 42, you have set forth a table in which you show in the third column the pressure loss in pounds over the Panhandle Field for various periods from the beginning of the field down to August 1, 1940, do you not?

A. Yes, sir.

Q. And those pressure losses were taken from the reports of the Texas Railroad Commission, were they not?

A. The pressures were and I believe that production also includes an estimate of unmetered gas as well as metered gas.

Q. I was confining my question to information on the present pressures.

A. Yes, they are Railroad Commission pressures.

[fol. 4019] Q. I gather from your testimony that there is a certain amount of tolerance inherent in the figures of the Texas Railroad Commission?

A. Yes, I would say that there would necessarily have to be, on an area of this magnitude.

Q. And the area reflected in these figures in the table shown on Page 10 of Exhibit 42 embraces the entire Panhandle Field, does it not?

A. Yes, sir.

Q. Both east and west? A. That is correct.

Q. Within what limits would you say that these figures shown in Column 3 headed, "Pressure loss in pounds" are accurate for all practical purposes?

A. It would be very difficult to name a percentage of error in that figure, but I think it would be comparatively low, due to the fact that it would have the tendency to be a compensating error, rather than an error of multiplication.

Q. Well, would you say that the degree of accuracy would be within one pound or two pounds or what?

A. I think that it could easily be within one pound.

Q. That is, one way or another, either up or down?

A. Yes.

Q. For each of the figures shown in the five columns?

A. That is true.

[fol. 4920] Q. Headed, "Pressure loss in pounds"?

A. Yes.

Q. Now, Mr. Hinton, in your direct testimony, you discussed your capital additions for the basic and for the anticipated load, but there are certain items that you did not discuss in detail, and I want to go through some of them for our information.

Will you please turn to Page 26 of Exhibit 42 on which page you start your list of capital additions to provide for the anticipated load from June 30, 1941, through 1946.

You won't need to refer to the basic load figures which appear from Page 21 to Page 25, inclusive, because the anticipated load figures embrace the basic load figures, do they not?

A. Yes.

Q. Now, looking at Page 26, have all of the capital expenditures listed on that page been made in the last six months of 1941 which have expired since you last testified in this proceeding?

A. They all have been made with the exception of the drilling in of the well located near Guymon, Oklahoma, in Hugoton Field, Oklahoma.

Q. Is that well now being drilled?

A. It has been drilled and the production string of casing has been set. I just talked to the office at noon and they have had 17 below zero weather out there and they are shut down.

[fol. 4921] They have not torn down the rotary rig yet.

Q. When will that well be completed and in service?

A. As soon as it gets warm enough that the water won't freeze. Probably we can pick out a few warm days through January or February to complete it.

Q. Have you purchased the new automobile listed on Page 26 as Item "e"? Fortunately, we have.

Q. Now, is this new automobile purchased to replace one that had been traded in?

A. No, sir. If that had been, it would not have been a capital expenditure. It would have been an operating expense. Q. You did not trade an old automobile on this new one, did you? A. No, sir.

Q. Now, throughout your capital expenditures for the anticipated load, you, I think, have some other automobiles and trucks?

A. That is right.

Q. That are expected to be purchased?

A. Yes, we hope.

Q. Well, did you expect to retire some of your automobiles and trucks during the next five years?

A. Certainly. We will retire them, but they will be [fol. 4922] immediately replaced by other equipment, by similar equipment. When you say "retire", do you mean to reduce the number of automotive units?

Q. I mean to retire an automobile from service, to trade it in on another one or to sell it or dispose of it because of its age.

A. Yes.

Q. You do expect to lose some automobiles, in other words, between now and the end of 1946?

A. Certainly.

Q. Due to wear and tear and so forth? A. Yes, sir.

Q. Have you made any deduction from your capital additions for the automobiles that are going to be retired from service?

A. No, because they will be replaced by similar units: as soon as one unit is retired, that will be replaced by another like unit.

Q. You have not included in these figures in Exhibit 42 the units that will be purchased for the purpose of replacing those that are retired?

A. No, sir.

Q. In other words, the automobiles and trucks that you include in your exhibit are only additional units?

A. That is true.

[fol. 4923] Q. Is that correct? A. Yes, sir.

Q. Now, in 1942, which is shown commencing on Page 27, you have an item shown as "b. Install liners in two old wells in the Panhandle Field."

Do those old wells now have liners?

A. No. If they did have liners and we had these two liners in the budget, it would not be a capital expenditure. It would be a maintenance item.

Q. Now, throughout the entire exhibit, you have a number of—well, I mean throughout that part of this exhibit which relates to these capital expenditures, you have numerous provisions for installation of liners.

Are you stating that in each and every instance where you have made a provision for a capital addition for the installation of liners, that those are not for the purpose of replacing or renewing old liners, but will be installed in the wells for the first time?

A. Yes, sir, everything is an addition and not a replacement that is included in this list.

Mr. Culton: Pardon me, I wonder if it would not be advisable at this point, so the record may be clear, to explain the difference between a well using liner and tubing and the wells as they have heretofore been operated without liner and tubing.

[fol. 4924] Mr. Littman: Very well.

The Witness: The reason that we have included liners in our future capital expenditures is due to the fact that, as pressure becomes lower in the field, it is more difficult to clean the well bore by blowing the well to the atmosphere, and in order to keep out all cavings possible from the well bore, these liners are installed.

A liner is merely a piece of pipe of small enough diameter that it can be lowered down the production string. The slots are either cut in rectangular shape, triangular shape, or in circles, and these slots permit the gas to feed into the well bore and at the same time hold back the cavings.

What else?

Mr. Culton: The tubing.

The Witness: A well that is tubed can be produced either through the tubing or if no packers are set, it can be produced through the old production string and in event that it is produced through the old production string;

why, the tubing merely acts as a syphon and is usually placed within two or three feet of the bottom of the well to take off the water from the well bore with the least waste of gas.

Mr. Culton: On your new wells, what is your practice as to liners and tubing?

The Witness: We do not complete a well in the Panhandle Field without a liner.

[fol. 4925] Mr. Culton: That is on the new wells?

The Witness: On the new wells, unless it is a large well and the flow will not permit us to install a liner. I am afraid we are not going to have many more of the type that we will not be able to install liners.

Mr. Culton: Pardon me for interrupting, but I thought that distinction might be pointed out.

By Mr. Littman:

Q. Now, in the year 1942, as shown by Item "c", you have made a provision for the installation of tubing in various old wells in the Panhandle Field, and I believe in the Hugoton Field, as well?

A. No, we have no tubing in 42 in the Hugoton Field.

Q. Is this all new tubing, or is it tubing that is installed to replace old tubing?

A. We do not have tubing in any well at this time in either field. The item "c" install tubing in two old wells in Panhandle Field costing $4,262" should be revised, because we have changed our mind about those two wells since this was made, and instead of running tubing in these wells, we intend to run another production string because we have studied the problem a little more thoroughly, and one of those is on the State Permit 1-106 well, and we feel that by running another production string, that we are going to be able to cement off water that is now coming into the well from above.

[fol. 4926] The other is for our Sneed 1-23 well; and we have had samples of water analyzed and find that the analysis of the water indicates that it is coming from above, rather than from two old abandoned holes which we thought was the source of the water in this well, so

rather than to take the last resort on this Sneed 1-23 well, we are going to—

Mr. Culton: (Interposing) What would be the last resort?

The Witness: Tubing—we are going to run a production string and see if we cannot yet save that well and get more production than we would by tubing.

By Mr. Littman:

Q. Would that increase or decrease your capital expenditure?

A. That would at least triple that item.

Mr. Culton: By that, what do you mean?

The Witness: It would be in excess of $12,000 instead of $4,000.

Mr. Culton: All right. The cost would be in excess of $12,000 instead of $4,000, the two wells together?

The Witness: Yes, sir.

By Mr. Littman:

Q. And would that $12,000 all be classed by Panhandle Eastern as capital addition?

A. Yes, I think it would, because it would be material that would be used in the further completion of this well. [fol. 4927] In other words, it we would have drilled that well and encountered the trouble at the time of the drilling, it would have been necessary to run another string of pipe, and that has happened on many wells in the Panhandle Field.

Therefore, I think it justifiable to include it as a capital expenditure.

Q. The next item you have is Item "d Acidize five old wells in Panhandle Field," costing $7,750. Have these five old wells been acidized before?

A. No, sir.

Q. This will have been the first acidizing operation?

A. That is correct. If they would have been acidized previously, that would be a maintenance item.

Q. Now, Mr. Hinton, throughout this study of future capital expenditures, you have numerous items similar to Item "d," which I just read and which we just discussed.

Are all of these acidizing operations comprehended by this exhibit those which are being made for the first time?

A. There may be one or two exceptions to that. I do not quite remember. What I mean by exception is, that in the years gone by, meaning the last three or four years, sometimes upon the completion of a well, we merely put in a treatment of acid which we term as a wash shot.

That is to clean out the well bore and make the well somewhat easier to maintain, but not with the thought of getting the ultimate increase in the open flow of that [fol. 4928] well and in that case where we put in the final shot, that is listed as a capital expenditure.

I am not sure whether there are or there are not some of those wells included.

Q. It is your testimony, then, that all of the acidization operations comprehended by your Exhibit 42 are those which will be charged to capital by the Panhandle Eastern?

A. I feel that everything included is a justifiable capital expenditure.

Q. Have you discussed the matter with the accounting staff that determines how matters of this kind shall be charged?

A. Yes.

Q. And they so advised you? A. Yes.

Q. Now, Item "e" on Page 27 is, "Lay well lines for five wells in Panhandle Field", costing $15,395. Will you state how many feet of well line you include for each well and the size of the pipe?

A. I would if somebody did not have File No. 32 of the working papers out.

. . . . . .

[fol. 4929] By Mr. Littman:

Q. Are you now prepared to answer the question I put to you just before the recess?

A. That was concerning item "e" on page 27 of Exhibit 42.

Q. That is right?

A. Yes, there will be 475 miles of 4-inch pipe required to connect those five wells.

. . . . . .

Q. Now, on page 27 of your Exhibit 42 you have an item listed as item "h", called "Increased capacity of present gathering line by looping existing lines and additional gathering lines costing $422,464". Will you state [fol. 4930] the breakdown of this line as to sizes of pipe and lengths and location?

A. I believe that I can give that correctly. It was given yesterday in yesterday's testimony. If I go ahead and give you those figures now and check them against the work sheets, then will it be permissible to make any necessary correction on the amounts?

Q. It will be satisfactory for you to correct your present figures, if you should find them incorrect.

A. That includes the looping of the present line commencing at the intake side of the Sneed compressor station and extending in a southwesterly direction for a distance of 2.7 miles.

* * * * * * * *

Q. You have a legend on Exhibit 45 which would be helpful.

You may proceed with your explanation.

A. The 2.7 miles of pipe just described commences at the intake side of the Sneed compressor station, which is located on the western portion of the Basemore Survey, Moore County, Texas, and extends in a southwesterly [fol. 4931] direction 2.7 miles. The size of this line is 26 inches o.d.

Q. Outside diameter? A. Right.

Q. That brings us to a point where the present 18-inch line coming in from the southeast and the present 20-inch line coming in from the southwest join. Isn't that point called Windmill Junction?

A. Yes. I can't make it out on the map or I would identify that section number.

We then expect to loop from Windmill Junction in a southwesterly direction to a point on the system known as Zofness Junction, which is located in Section 29, Block 6-T, T. and N. O., Moore County, Texas.

Q. Will you give us the distance of that last connection?

A. I believe that distance is eight miles and it is to be 24-inch o.d. pipe. From the described point of ending of this line it is then planned to loop the present 12-inch line, which is directly west of said point, for a distance—I can't recall that distance but it is to the point where the present system is enlarged to 16-inch pipe. That will be 20-inch pipe.

Q. You can give us the approximate distance, can you not, Mr. Hinton, each square being a mile?

A. It looks to be 6.33 miles.

From that point in an almost straight westerly direc-
[fol. 4932] tion it is planned to loop the present 16-inch pipe line with another 16-inch o.d. pipe line to a point near the center on the north line of Section 25, Block 44, H. and T. C. Survey, Houston, Texas.

I believe that that is all of the major looping that was included in that.

Q. That takes care of the gathering line from Zofness to Sneed by looping, does it not?

A. And, also, to the west of Zofness out near the extreme end of the present system, the extreme west end of the present system.

Q. Now, you, also, refer, in your description of that item on page 21, to certain additional gathering lines to serve new roads. Have you described that gathering line or those gathering lines? In other words, I would like to have the balance of the facilities embraced by this item.

A. There is an additional gathering system which commences at the center of the north line of Section 28, Block 44, H. and T. C., and extends southwesterly approximately one mile to the center of Section 29, Block 44, H. and T. C. This will be 8-inch i.d. pipe.

Q. And what is the length?

A. Approximately a mile.

Q. Are there any other facilities embraced by this item. A. Not gathering lines.

[fol. 4933] Q. Well, have you described all of the items included within the item "h" on page 27, for which you expect to expend the sum of $422,464?

A. No, I do not believe so. That is all I see here at the present time and it will bear checking when I get the work papers.

Q. You will check the matter when you get your working papers and report any additional facilities, if there are any?

A. Yes. It seems to me that it would be much better if we could wait until those working papers do get here, because it would save us the time of repeating this, if that would be all right with you, if you have any other thing that you could go ahead with.

Q. I do not believe, Mr. Hinton, that we will have any other situations like this for the year 1942. Let's see how well we can get along.

A. All right.

Trial Examiner: Mr. Hinton, you have been making reference to Exhibit No. 45, have you not, in the location you have just pointed out on the map?

The Witness: Yes.

Mr. Culton: Perhaps you had better clarify that by showing that this construction which you are talking about all has a certain color on the map, does it not?

The Witness: Yes, it is all colored brown.

[fol. 4934] By Mr. Littman:

Q. Before we leave that item, Mr. Hinton, I call your attention to your testimony at pages 716 and 717 of the transcript in which you made the following statement in response to the following question:

"Q. And this is the character of additional gathering line capacity that you think will be needed in this particular situation?

"A. It could be taken care of in either manner and we studied both methods of trying to increase our load into Zofness. The design of our pipe line system is such that it is almost necessary to loop the greatest part of it, even if we went to what we might term 'a centralized horsepower' and, therefore, we decided that probably the looping would be better because we would spend about the same amount of money and we would cut down the operating cost at another compressor station, which would be located out near the Zofness Camp."

Q. Did you mean to use the term "centralized horsepower"? A. Yes.

Q. Or decentralized horsepower?

A. That would be termed as "centralized field horsepower". If it was a decentralized system, it would mean that we would take care of each individual well with a small booster, but by centralized that would mean that there would be a compressor station built in Section 29, Block 6-T, N., T. and N.O., Moore County, Texas, and the [fol. 4935] production would come into that station and it would be boosted or the pressure would be increased by that station, so that we could come into Sneed station at a higher intake pressure.

Trial Examiner: May I ask a question, Mr. Hinton, about the mechanical factors in the production of gas? I assume when you go into a new field and bring in a new well in a newly constructed gathering line, the gas would come into the newly constructed line, we will say, at the rock pressure which might range upwards of 400 pounds per square inch.

The Witness: It will be all according to the type of well and what volume of gas you want to take from the well. For instance, a well in the Hugoton field of Kansas that was drilled at a virgin pressure of between 435 and 445 pounds and operated at 400 pounds would not deliver the same amount of gas by any means that a well in the Panhandle field that was drilled at virgin pressure and operating against 400 pounds would deliver into the line. It would vary in each field and that is what I am trying to bring out.

Trial Examiner: That is by reason of the different rate of production due to difference in permeability of formations?

The Witness: Yes.

Trial Examiner: All right. Now, your well, we will say, continues to feed into a gathering line at an assumed [fol. 4936] pressure of upwards of 400 pounds per square inch, continuing until that pressure drops. The problem of pressure is not a problem for you until the pressure becomes less than the pressure you desired to maintain in your line, is that true?

The Witness: That it true.

Trial Examiner: And what then happens?

The Witness: There is one of two things which usually happens and that is that the well ceases to produce gas or there is horsepower installed to aid in delivering gas into a pipe line.

Trial Examiner: Now, in what way does the use of compressors aid the induction of gas into the pipe line?

The Witness: It lowers the pressure against which the well is forced to produce its gas.

Trial Examiner: So that instead of a pressure against which the new gas has come, you are approaching a vacuum condition or a lessened pressure?

The Witness: A lessened pressure but considerably far from a vacuum.

Trial Examiner: Will you ever reach the point where there is an actual vacuum beyond your entrance valve?

The Witness: No.

Trial Examiner: That is impractical?

The Witness: That would be very expensive.

Trial Examiner: So that you are simply taking ad- [fol 4937] vantage of the natural pressure and that can not be assisted from a practical standpoint?

The Witness: No.

Mr Culton: Mr. Hinton, I am wondering if the Examiner's questions couldn't be amplified on by explaining the difference between the use of field compressor stations and the centralized plant about which you spoke? In other words, in one of them you take the gas immediately at the well, do you not, and boost its pressure in the field compressor station, but in the centralized station you put on something in the nature of a suction at the gathering point?

The Witness: Well, it is just a matter of assembling the horsepower in one place or scattering it out of the field.

Mr. Culton: But one pushes and the other pulls. That is the ordinary way of saying it, isn't it?

The Witness: Well, that is the ordinary way of saying it, but it is erroneous because you never—

Mr. Culton: (Interposing) Never get down below zero, I understand.

The Witness: No, you never actually suck gas. All that happens is that the pressure is lowered to the point where the gas of the higher pressure will flow to the area of lower pressure.

Mr. Wheat: Mr. Hinton, is it possible that the Examiner had in mind the fact that there have been some gas [fol. 4938] fields in which they have said they were pulling against a vacuum? That is not true in the Panhandle field and, in your opinion, will not be true, commercially? Is that correct?

The Witness: That is correct.

Trial Examiner: Well, the effect of charging the pipe at the Liberal station at a high pressure, if all valves between that station and the field were open, would, to a certain extent, be the effect of suction back of the compressor, would it not?

The Witness: Well, when you speak of suction, I am thinking of something that has a direct pull.

Trial Examiner: Well, doesn't it have that very thing?

The Witness: No, sir.

Trial Examiner: In order to produce your volume of gas under the high pressure?

The Witness: No, sir, I don't think that it does. It just merely lowers the pressure so that there is a pressure gradient which is efficient to enable the desired volume of gas to flow.

Trial Examiner: In other words, the Liberal compressor station does not accomplish more than to remove the resistance?

The Witness: That is correct.

By Mr. Littman:

Q. Item "p", shown on page 27, is an item for the construction of the Cimarron River crossing for loop line, [fol. 4939] costing $220,384. Will you please identify on your map, Exhibit No. 46, the Cimarron River crossing and give us the number of the line and the location by section number?

A. Well, the location of that river crossing will be, in all probability, Section 26, Township 33, Range 32, Seward County, Kansas.

Q. The Cimarron River is not shown on that map.

A. No, it is not.

Q. And what is the number of the line?

A. It is four 16-inch lines and I don't know what you mean by "number". To what number do you refer?

Q. Well, what is the loop line number?

A. I don't know.

Mr. Culton: You refer to the accounting practice, don't you?

Mr. Littman: I understand these lines have certain numbers.

Mr. Culton: That is for accounting purposes on the accounting records.

The Witness: No, for operation, also.

Mr. Culton: Are they?

The Witness: Yes, sir.

By Mr. Littman:

Q. But you do not recall the number?

A. I do not recall what it is.

[fol. 4940] I might add that the result that may be obtained by the installation of the river jetties may have something to do with the location or the relocation of the proposed river crossing.

Q. Now, on page 28 you show an item "r", the construction of the gathering line from Section 31, Township 4 to near Optima in Texas County, Oklahoma, at a cost of $324,180.

A. That is correct.

Q. What is the size, length and location of that gathering line?

A. That will be a 22-inch o.d. line, the distance will be approximately 15 miles and it will leave the present 22-inch line in the southeast quarter of Section 31, Township 4, Range 19, Texas County, Oklahoma, and extend west to the approximate center of the south half of Section 34, Township 4, Range 16 west.

Q. Now, your next item on that page is item "s", "Construct gathering line in Oklahoma connecting with the Optima line at a cost of $856,606".

A. That is right.

Q. At which point will the latter line connect with the one which you just described?

A. Near the center of the south half of Section 34, Township 4, Range 16.

Q. Now, will you please give a description of the gathering line embraced by item "s"?

[fol. 4941] A. The first gathering line will extend from the center of said Section 34 in a south and slightly easterly direction, a distance of approximately 7½ miles, and it will be 12-inch i.d. pipe.

The next line will start from the same point in said Section 34 and extend in a southwesterly direction a distance of 8.4 miles to a point in the approximate center of the northwest quarter of Section 12, Township 2, Range 15, Texas County, Oklahoma. At that point this gathering line reduces from a size of 16 o.d. to 12 i.d. pipe and extends to a point in the northwest quarter of Section 4, Township 1, Range 15, a distance of 5.8 miles, thence in a westerly direction slightly south this pipe is extended with 10-inch pipe for a distance of 6.3 miles to a point in the southwest quarter of Section 9, Township 1-14, thence in a westerly direction the extension is made with 8-inch pipe for a distance of 6.1 miles to a point in the southwest quarter of Section 9, Township 1-13 west, all in Texas County, Oklahoma.

Q. Now, that completes the branch that runs from the central point that you gave a moment ago as south and then west. Now, I notice some other branches on the map.

A. We again start near the center of the south half of said Section 34-4-16 and extend in a northwesterly direction with 16-inch, o.d. pipe a distance of 16.7 miles. [fol. 4942] The size of the pipe is here reduced to 10-inch and extends in the same general northwesterly direction, a distance of 4.6 miles.

Q. (Interposing) Will you give us the point on the map?

A. Yes. That is from the center of Section 36, Township 5, Range 13 and 10-inch pipe extends to a point near the center of the northwest quarter of Section 20, Township 5, Range 13.

Branching off from the 16-inch line, heretofore described, at a point near the center of the north half of Section 5, Township 4, Range 14 and extending in a northerly and slightly easterly course to a point near the center of the southeast quarter of Section 29, Township 5, Range 14, a distance of 1.6 miles, there will be laid a 6-inch line.

Q. Now, is that called a gathering line?

A. Yes. A gathering line is a line that serves more than one well.

From a point near the southwest corner of Section 7 another gathering line takes off of the 16-inch line and runs in a northeasterly direction to a point near the center of Section 6, Township 4, Range 15 west. There this line divides and a branch runs to the northwest which will be 8 inches inside diameter and this will extend to a point near the center of the south half of Section 25, Township 5, Range 14 west, a distance of approximately 1.7 miles.

The other branch from the end of the 10-inch line lo- [fol. 4943] cated near the center of the north half of Section 6-4-15 will extend northeasterly to a point near the center of the southwest quarter of Section 28, Township 5, Range 15.

There is, also, another line that takes off from the end of the 22-inch trunk gathering line that will start near the center of the south half of Section 34, Township 4, Range 16 west and extend in a northeasterly direction a distance of 5.0 miles and this pipe will be 16 inches, o.d.

At the end of the 16-inch line, which is in the northeast quarter of Section 12, Township 4, Range 16, a line will extend almost due east to a point in the northwest corner of Section 12, Township 4, Range 17, a distance of approximately 5.3 miles.

Then, from the end of the same 16-inch line there will be a line that will extend in a northwesterly direction to the center of Section 8, Township 5, Range 16, a distance of approximately 6.8 miles and this line will be eight inches inside diameter.

I believe that completes the description of all the gathering lines.

Q. Does that complete the description of all of the facilities embraced within the item "s" on page 28?

A. I believe that it does, Mr. Littman.

Q. Well now, you may, of course, check your answer later and supply any corrections or additions, if you wish, [fol. 4944] but I am very anxious that you do that so that we may know that if you don't have any corrections later that we may rely upon the testimony and description.

A. Well, we know that there will be corrections because I am not that good at scaling.

Q. Those distances which you have given are approximate, having been measured by you by the scale on the map?

A. And estimated in most cases.

Q. Now, in this exhibit you used the term "well lines" and "gathering lines". A. Yes.

Q. You have already defined the term "gathering lines" as used by you. Now, will you define the term "well lines" as used by you in this exhibit?

A. A well line is a pipe line that is used to transport gas from the well to the gathering line.

Q. And the well line serves only one well, does it not?

A. Except in rare cases where a location is drilled that was not planned in the development and then sometimes the well line to the original well is extended to the other well but it is still carried on the books as a well line.

Q. Well, is there any such exception in your Exhibits 42 and 43? A. No, sir, there is not.

Q. You see, this is important for us to know so that we [fol. 4945] may make certain that we understand precisely what lines are included within each of these items.

A. Yes. I think it would be helpful for you to have that detailed information and as soon as the photostatic sheets arrive here, if the other file doesn't turn up, why, that will be furnished.

Q. Very well.

Now, your next item "t" on page 28, "Construct well lines for 20 new wells costing $47,610", can you give us the total length of pipe and the sizes of pipe for each length? I meant to say on the length of each size of pipe for these new wells.

A. I can give it to you approximately.

About 14.69 miles, all 4-inch, i.d. pipe.

Q. That is the total mileage for the 20 well lines?

A. Yes, sir.

Q. I should say for the 20 wells and 20 well lines.

A. I wouldn't argue with you about it.

Q. You have an item on page 28 called item "x", "Construct office building at Hugoton Camp, costing $7,000". A. Yes, sir.

Q. Why do you include this item?

A. Because there is no place for any clerical work out there at the present time.

Q. Don't they have an office building in the Hugoton [fol. 4946] Camp now?

A. Yes, we do. We have two rooms that are approximately nine feet by 10 feet and there are many times 20 men in those two rooms, so you can readily see that there is small chance of doing any of the clerical work required and it is necessary that it be done just whenever enough of the men get out so that it can be done.

During the wintertime operation in that field a large crew is required due to the type of gas that is produced in Hugoton field and it is often necessary that these fellows wait around the office until such time as word is carried back by a chart changer telling them which well lines have to have attention.

. . . . . .

Q. Now, looking at the list of capital expenditures contemplated and estimated for the anticipated load for the year 1943, I see that item "e" shows the construction of well lines for five new wells in the Panhandle field at a cost of $23,335. Will you give us the length of pipe and size of pipe?

A. Yes, sir. The total amount of pipe required is 7.20 [fol. 4947] miles and that is all 4-inch, i.d. pipe.

Q. By the way, were all of the well lines to which you referred as being covered by item "t" in the previous year, 1942, located in Texas County, Oklahoma?

A. Yes.

Q. Do you have the information available for the five wells in 1943 embraced by item "e" as to length of line for each of the five wells?

A. Yes, sir.

Q. You have your working papers here for that?

A. I do.

Q. Will you please read those into the record?

A. For the Purvin-Redmond well, located near the center of Section 69, Block 44, H. and T. C. Survey, that line will extend .20 of 1 mile to a point near the same location, of course.

The Hauneman, located near the center of Section 100, Block 44, H. and T. C. will extend from a point near the center of Section 69, Block 44, H. and T. C., to the well and will be approximately 1 mile in length.

The Kilgore 56 will be located near the center of Section 56, Block 44, H. and T. C. Survey, and will extend to a point near the center of the south line of Section 57, Block 44, H. and T. C., and the total distance will be approximately 1 mile.

[fol. 4948] The Kilgore near the center of the north half of center Section 57, Block 44, H. and T. C., will extend to a point near the center of the south line of Section 57, Block 44, H. and T. C., and will be approximately 70 miles in length.

The Taylor will extend from a point near the center of Section 5, Block 1, J. P. Survey, and will extend to a point in the southeast quarter of Section 23, Block 1, J. P., and will be a distance of 4.30 miles, making a total of 7.20 miles for the five wells all located in Moore County, Texas.

Q. On page 29 you have item "g." You have an item of construction of additional gathering lines to serve new wells in Panhandle field, costing $7,815. Will you describe those facilities?

A. Yes.

Q. And give the location.

A. That is a gathering line for the purpose of taking on the Purvin-Redmond well and will extend from a point near the center of Section 69, Block 44, H. and T. C., Moore County, Texas to the south line of Section 58, Block 44, H. and T. C., Moore County. It will be 6-inch i.d. pipe and approximately 1.5 miles in length.

Q. Mr. Hinton, I refer you to item "k" on page 29, which provides for the construction of well lines connecting 10 Oklahoma wells costing $20,710. Will you give us a description of those well lines?

[fol. 4949] A. Yes, sir. I believe, probably, the best way to identify those would be to mention the farm name and then describe the line. I think it would be about as clear that way as any.

Q. And I think it would be well to point to the map, Exhibit No. 46.

A. The first well line is to the Beer lease and that is located near the center of the south half of Section 20-5-14 and that extends in a southeasterly direction to a point in the southeast quarter of Section 29-5-14. It is a 4-inch i.d. line of approximately 1.03 miles in length.

The Duer is in the center of the south half of 12-4-17 and extends in a northwesterly direction to a point in the northwest quarter of Section 12-4-17, a distance of .47 of 1 mile.

All of these pipe lines will be 4-inch inside diameter pipe, so I won't read the diameter each time.

The third well is the Heimsath. That is located in the center of the north half of 21-4-15 and extends in a northeasterly direction to a point in the northeast quarter of 21-4-15, a distance of .22 of 1 mile.

The Miller is in the center of the south half of 19-2-17 and extends in a westerly direction to a point in the southeast quarter of Section 23-2-16, a distance of approximately 1.30 miles.

[fol. 4950] The Miller—this is the second Miller well—is located near the center of Section 23-2-16 and extends to a point in the northeast quarter of Section 23-2-16, a distance of .40 of 1 mile.

Another Miller well is located near the center of the north half of Section 25-2-16. The pipe line extends to the northwest quarter of 25-2-16 a distance of .42 of 1 mile.

Another Miller well is located near the center of the northwest quarter of Section 36-2-16. The pipe line extends to near the center of line of 25-2-16, a distance of .90 of 1 mile.

The Stamper is located from a point near the center of the west half of 17-3-16. The line extends to a point in the southeast quarter of 17-3-16 and that line is .68 of 1 mile.

Then the Stratton is near the center of the west half of 18-1-16 and the pipe line extends in a westerly direction to a point on the west ling of 18-1-16, a distance of .27 of 1 mile.

The White is near the center of the west half of Section 2-3-16. That line extends in a northwesterly direction to a point in the northeast quarter of Section 20-3-16, a distance of .70 of 1 mile, all being 4-inch inside diameter pipe and all located in Texas County, Oklahoma.

Q. Now, on page 29 you have an item called "n", "Construct additional gathering lines serving new Hugoton [fol. 4951] wells, costing $52,710." Will you please describe those facilities?

A. The items under "n," page 29, Exhibit 42, include a 6-inch line which starts in the northwest quarter of Section 4-1-15 and extends in a southeasterly direction to a point on the west line of Section 18-1-16; a distance of 4.2 miles, the diameter of the pipe being 6-inch i.d.

Q. Does that complete your description?

A. No, sir. It is what is known as the Miller block extension, which begins near the southeast quarter of Section 11-2-16 and extends to the northwest quarter of Section 25-2-16 and that will be a 12-inch line 2.7 miles in length. Both lines described will be in Texas County, Oklahoma.

Q. Now, before leaving 1943, I note that you have a section on your map, Exhibit No. 46, colored in green, which is for the year 1942.

A. Yes, sir.

Q. In Section—

A. (Interposing) 26-4-17.

Q. (Continuing). Called Duer. This patch of green seems to be isolated from the rest of the system. Will you explain what facilities are embraced by that part of the legend?

A. The lease on the Duer well includes the northeast quarter of Section 26-4-17 and by drilling the well on this [fol. 4952] acreage here the entire lease was secured, so that will be secured acreage but not pro-rated acreage at this time because it would be in excess of a 640-acre unit, which is the maximum unit that we use in our proration formulas.

Q. You don't intend to drill the portion colored in green to which I just referred? Isn't that right?

Mr. Culton: You mean during the period that this covers.

The Witness: No, not during the period which this map covers, but that puts us in an excellent position to either trade acreage with some other company that has a similar base to add to ours or to buy adjoining acreage to that.

By Mr. Littman:

Q. Well, you haven't included any facilities for the connection of that lease, have you?

A. No, sir. We will just save $80 a year in delayed rent.

Q. Now, looking at the year 1944, which commences on page 29 of Exhibit 42, you have an item "e", "Laying well lines connecting five new wells in Panhandle field, costing $15,071." Will you please describe those facilities?

A. You understand that I do not have my working papers for this year and the description will be approximations which I may correct afterwards.

Q. This is one of the years for which you do not have the working papers?

[fol. 4953] A. Yes.

Mr. Culton: We are in the Panhandle field now. You have the Hugoton but—

The Witness: (Interposing) No, we are over in another year now.

By Mr. Littman:

Q. Well, do you have your working papers for the year 1945?

A. I believe I have. Yes, I do.

Q. Well, let us skip 1944 for the present and go to 1945. I call your attention to an item of "h" on page 30 of Exhibit 42, calling for the construction of well lines to connect 10 new wells at the Hugoton field, costing $36,234. Will you please describe those facilities?

A. Yes. Do you want them pointed out on the map?

Q. Not if your description is sufficient for purposes of locating them on the map.

A. It is.

You understand that five of those are in the Kansas portion of the Hugoton field and five in the Oklahoma portion of the Hugoton field. The ones which will follow are those that are in the Oklahoma portion of the Hugoton field.

The Chittenden is near the center of the northeast quarter, Section 3-4-16 and the pipe line extends to a point in the southwest quarter of 35-5-16, 4-inch line 1.1 miles in length.

[fol. 4954] The Fisher is near the center of 32-4-13 and the pipe line extends to a point near the center of 33-4-13, Texas County, Oklahoma, and the length is 1.03 miles.

The Jones is near the center of the east half of 4-3-13 and the pipe line extends near the center of 33-4-13, Texas County, Oklahoma. It is approximately 1 mile in length.

The Wright is near the center of the north half of Section 24-4-16 and the pipe line extends to a point in the southwest quarter of 24-4-16, being .35 of 1 mile.

The Zbinden is near the center of the southwest quarter of 29-4-16. The pipe line extends to a point near the center of the north line of 23-4-16, Texas County, Oklahoma and is 4-inch line, .35 of 1 mile in length, a total of 3.83 miles for the five lines.

The well lines which will be located in the Kansas portion of the Hugoton field are the Collingwood and the line will extend from a point near the center of the north half of Section 5-29-34 to a point in the northeast quarter of 8-29-34, Haskell County, Kansas, a distance of 3.1 miles; the Hayward and Friend extend from a point near the center of Section 36, Township 34, Range 40 to a point near the center of Section 6, Township 35, Range 39, Morton County, Kansas, 1.52 miles; Hoffman and Davis is near the center of 29-28-36 and the pipe line extends to a point in the southeast quarter of 31-28-36, Grant County, Kansas, a [fol. 4955] length of 1.60 miles; the Hooper will extend from a point near the center of the south half of Section 22, Township 30, Range 35 to a point near the center of the north half of Section 10, Township 30, Range 35, Grant County, Kansas, 2.45 miles in length; and the Miller is near the center of 29-28-37 and the pipe line will extend to a point near the northwest quarter of 32-28-37, Grant County, Kansas, a distance of .68 mile, all 4-inch inside diameter pipe and the total of the five wells is 7.35 miles.

Q. Now, the last letter item for the year 1945 is item "j" on page 31, "Construct additional gathering lines to serve new wells in the upper Hugoton field, costing $135,257." Will you please describe those gathering lines?

A. Yes, sir. There will be two gathering lines in Texas County, Oklahoma, the first being what will be known as the Jones and it will be a line that will start near the center of Section 22-4-13, Texas County, Oklahoma, and extend to near the center of 33-4-13, Texas County, Oklahoma, a 6-inch i.d. line, 2.3 miles in length.

The Wright will be the next gathering line and it will commence in the northeastern quarter of Section 23-4-16, Texas County, Oklahoma and will extend to a point in the southwest corner of 24-4-16, Texas County, Oklahoma. It will be a 6-inch inside diameter line of a length of .60 of 1 mile.

[fol. 4956] In Kansas the following gathering lines will be built: The first will be known as Collingwood and it will commence in the southwest quarter of Section 2, Township 30, Range 35, Grant County, Kansas and extend to a point in the northeast one-quarter of Section 8, Township

29, Range 34, Grant County, Kansas. It will be an 8-inch inside diameter line, 6.3 miles long.

The next will be known as the Ulysses and that will be a line that will commence in the northeast quarter of Section 9, Township 29, Range 36, Grant County, Kansas and extend to a point in the northwest quarter of Section 32, Township 28, Range 37, Grant County, Kansas. This will be a 10-inch inside diameter line that will be 7.6 miles in length.

Q. Does that complete the description of all the facilities embraced within item "j" on page 31?

A. It does.

Q. And that brings us to the end of the year 1945?

A. Right.

Mr. Culton: Except for 1944.

Mr. Littman: Yes.

The Witness: 1944 and the corrections on 1942.

[fol. 4959] C. H. HINTON, a witness, having been previously duly sworn, resumed the stand and testified further as follows:

Cross-Examination (Resumed)

By Mr. Littman:

Q. Mr. Hinton, will you please turn to Page 31 of your Exhibit No. 42, on which page you set forth the capital additions which you estimate will be required to be installed in that year in order to meet the so called anticipated load?

In Item "f" on that page, you provide for the construction of well lines to connect 20 new wells in the Hugoton Field, costing $63,913. Will you please describe those facilities?

A. The additions under capition "f", Page 31, Exhibit 42, are well lines which will be required to connect wells that will be drilled during the year 1946, 10 of which are located in Texas County, Oklahoma, and 10 in the Kansas portion of the Hugoton Field.

Exhibits:		
1, Statement of operating Results of Panhandle Eastern Pipe Line Company and Michigan Gas Transmission Company, 1938-1940	10775	4012
Operating Results	10775	4012
Cost, and Cost Less Reserves, of Plant and Operating Results as of December 31, 1938	10777	4013
Cost, and Cost Less Reserves, of Plant and Operating Results as of December 31, 1939	10778	4014
Cost, and Cost Less Reserves, of Plant and Operating Results as of December 31, 1940	10779	4015
Working Capital Estimate, December 31, 1938-39-40	10780	4016
Working Capital Estimate Approximate Payroll Basis, December 31, 1940	10782	4017
2, Determination of possible Revenue Reduction of Panhandle Eastern Pipe Line Company and Michigan Gas Transmission Company	10783	4018
3, Excerpts from Registration Statement of Panhandle Eastern Pipe Line Company filed with the Securities & Exchange Commission, February 12, 1937, with respect to Gas Reserves	10785	4019

	Original	Print
4, Excerpt from Registration Statement of Panhandle Eastern Pipe Line Company filed with the Securities & Exchange Commission, November 13, 1940, with respect to Gas Reserves	10786	4021
5, Excerpts from Registration Statement of Panhandle Eastern Pipe Line Company filed with the Securities & Exchange Commission, November 13, 1940, with respect to Design, Construction and Maintenance of Property	10789	4025
6, Statement of Operating Expenses and Taxes at 100% Load Factor Operation	10791	4029
7, Statement as to necessary Price per M. C. F. at 100% Load Factor	10793	4030
8, Statement of estimated Effect of 100% Load Factor on earning Power of System	10795	4030
9, Statement of Factor affecting the Nature and Magnitude of reported Net Incomes	10796	4031
10, Statement showing Effect of Variation in accounting Practices on Reported Incomes of an Enterprise	10799	4034
11, Chart showing Relation of Yield of United States Treasury Bonds and Notes	10800	4035
12, Statement showing United States Treasury Bond Yields	10801	4037
13, Chart showing History of Yields of United States Bonds, 1920-1939	10806	4045
14, Average Yield of United States Treasury Bond	10807	4047
14-A, Securities & Exchange Commission Releases Nos. 2778 and 2834 — Findings and Opinion of the Commission in the Matters of Panhandle Eastern Pipe Line Company, et al	10808	4047

Index, Volume IX.

Order of Securities & Exchange Commission Denying Applications in Part and granting Applications in Part	10842	4087
Supplemental Order of Securities & Exchange Commission amending Findings and Opinion	10844	4089
17, Miscellaneous Data concerning Property and Operations of Panhandle Eastern Pipe Line Company	10848	4090
Schedule 1, Panhandle Eastern Pipe Line Company System Compressor Stations	10848	4090
Schedule 2, List of Communities receiving Service directly or indirectly from Panhandle Company including Population and Number of Customers as of June 30, 1941	10849	4091
Schedule 3, List of Industrial Customers receiving Service direct from Panhandle Company System, June 30, 1941	10853	4099
Schedule 11, Panhandle Eastern System Summary — Miles of Pipe by Sizes, June 30, 1941	10926	4101
30, Testimony of Rufus M. Smith	10958	4103
Schedule 2, Estimated Original Gas Content in the Texas Panhandle Field under Acreage constituting Reserves of Panhandle Eastern Pipe Line Company as of July 1, 1941	10988	4123

	Original	Print
Schedule 3, Estimated Remaining Gas Content in the Texas Panhandle Field under Acreage constituting Reserves of Panhandle Eastern Pipe Line Company as of July 1, 1941	10987	4125
Schedule 5, Comparison of Open Flow Potentials in Texas Panhandle Gas Field	10990	4129
Schedule 6, Gas Acreage owned and under Gas Purchase Contracts held by Panhandle Eastern Pipe Line Company as of June 30, 1941	10991	4131
Schedule 7, Hugoton Production to Argus Natural Gas Company, Inc. by Panhandle Eastern Pipe Line Company, et al	10992	4133
Schedule 8, Texas Production to Panhandle Eastern Pipe Line Company	10993	4135
Schedule 9, Hugoton Production to Panhandle Eastern Pipe Line Company	10997	4143
Schedule 10, Hugoton Production to Panhandle Eastern Pipe Line Company	11000	4149
Schedule 11, Analysis of Cumulative Production to Main Line to and including Fiscal Month of June 1941	11003	4155
Schedule 12, Comparative Statement of Production and Purchases from each District for the two Years ended June 22, 1940 and June 22, 1941	11004	4157
36, Testimony of Glenn G. Bartle	11009	4159
Schedule 3, Estimated Original Gas Content in the Hugoton Field, (Kansas, Oklahoma and North Texas Panhandle), under Acreage constituting Reserves of Panhandle Eastern Pipe Line Company as of July 1, 1941	11038	4176
Schedule 4, Estimated unmetered Gas from Panhandle Eastern Pipe Line Company Wells in the Hugoton Field Kansas, connected to Argus Natural Gas Company, Inc. as of July 1, 1941	11041	4181
37, Testimony and Exhibits, Market Value of Leases of Panhandle Eastern Pipe Line Co.	11047	4187
R. J. Wallace	11047	4187
Summary of Market Value of Leases	11064	4199
38, Basic Statistics used in calculating Interest, ad valorem Taxes and operating Expense attributable to unused Capacity	12159	4203
39, Reproduction Cost New of Plant, Property and Business of Panhandle Eastern Pipe Line Company and subsidiary Companies as of June 30, 1941	12162	4206
Letter P. McDonald Biddison, Consulting Engineer, to Panhandle Eastern Pipe Line Company, August 29, 1941	12163	4206
Statement relating to Reproduction Cost—New—June 30, 1941	12164	4207
Summary	12165	4207
39-A, Reproduction Cost New of Plant, Property and Business of Panhandle Eastern Pipe Line Company and subsidiary Companies as of June 30, 1941	13130	4208
Letter P. McDonald Biddison, Consulting Engineer, to Panhandle Eastern Pipe Line Company, August 29, 1941	13130	4208

	Original	Print
Statement relating to Reproduction Cost New—June 30, 1941	13131	4209
Summary	13133	4209
40, Table showing estimated Main Line Sales, years 1941-1948, inclusive	13149	4211
41, Graph showing Sales and Gas Plant by Years, Panhandle Eastern Pipe Line Company and Subsidiary Companies	13150	4213
42, Testimony of C. H. Hinton relating to Future Capital Expenditures and Operating Expenses in Production and Gathering System West and South of Liberal, Kansas	13151	4215
43, Schedules presented in connection with the written Testimony of C. H. Hinton	13193	4244
Schedule 1, Additional Capital Expenditures required to produce and gather Basic Load, or Present Requirements	13194	4244
Schedule 2, Additional Capital Expenditures required to produce and gather Anticipated Increased Load	13195	4244
Schedule 3, Estimate of Operation and Maintenance Costs -west of Liberal Panhandle Field — Basic Load	13196	4245
Schedule 4, Estimate of Operation and Maintenance Costs — west of Liberal Panhandle Field — Estimated Future Load	13199	4251
Schedule 5, Probable Production from Panhandle Eastern's own Wells and Wells under Gas Contracts (Panhandle Field) during the Period July 1, 1940 to December 31, 1956	13202	4257
47, Panhandle Eastern Pipe Line Company and Subsidiary Companies, future Capital Requirements, Gas Transmission Facilities, Liberal Station and Eastward	13206	4257
48, Statement showing Balance Sheets per Books, Panhandle Eastern Pipe Line Company and Subsidiary Companies, as at each December 31, 1930 through 1940 and as at June 30, 1941	13207	4259
49, Income Statement per Books — Period from April 1, 1932 to December 31, 1941	13210	4265
50, Statement showing Earned Surplus per Books, Period from Commencement of Operations to June 30, 1941	13212	4269
51, Statement showing Capital Surplus per Books, Period from September 1, 1930 to June 30, 1941	13214	4273
52, Statement showing Investment in Gas Plant as at each December 31, 1930 through 1940 and as at June 30, 1941	13215	4275
53, Statement of Dividends paid on Class A and Class B Preferred Stocks from beginning to September 1, 1941	13217	4279
54, Statement of Dividends paid on Common Stock from beginning to September 1, 1941	13219	4280
55, Statement showing Comparison of Sales and Revenue, Principal Industrial Customers, years 1939, 1940 and 1941	13220	4281
55-A, Statement showing Comparison of Sales and Revenue, Principal Industrial Customers, years 1939, 1940, and 1941	13221	4283
56, Statement of Gas Produced, Period from April 1, 1932 to June 30, 1941	13222	4284
57, Statement of Gas Purchased, Period from April 1, 1932 to June 30, 1941	13223	4285

	Original	Print
58, Statement of Gas Revenue, Period from April 1, 1932 to June 30, 1941 and Schedule showing Detail of Sales to various Types of Customers, 1939 and 1940	13224	4287
Schedule 1, Statement of Gas Revenue, Period from April 1, 1932 to June 30, 1941	13224	4287
Schedule 2, Detail of Sales to Gas Utilities, years 1939 and 1940	13225	4289
Schedule 3, Detail of Sales to Industrial Customers, years 1939 and 1940	13227	4293
59, Statement of Gas Revenue by States, Period from April 1, 1932 to December 31, 1941	13229	4297
60, Statement showing Sales Agreements with other Gas Companies as at June 30, 1941	13230	4299
61, Study of Current and Future Trends in Commodity Prices and Wages, by David Friday	13238	4310
Graph showing Wholesale Prices from 1800 to 1940	13239	4311
Index Numbers of Wholesale Prices of Commodities by Groups	13241	4313
Commodity Price Indexes of Ten Countries	13247	4318
Statement relating to Tax Collections in the United States, from 1913 to 1942	13258	4328
Index Numbers of Wholesale Prices of all Commodities by Months, from 1890 to 1940	13263	4333
Statement relating to Wholesale Prices for Week Ended September 20, 1941	13264	4335
Graph relating to Average Weekly Earnings in Manufacturing Industries of New York State from 1914 to 1941	13266	4339
Graph relating to Average Hourly Earnings and Average Actual Hours per Week per Worker in twenty-five Manufacturing Industries from 1914 to 1941	13267	4341
Graph relating to Average Cost of Living from 1935 to 1939	13268	4343
62, Deduction from Cost of Reproduction New for Depreciation and Present Value of Plant, Property and Business as of June 30, 1941	13270	4345
Letter from P. McDonald Biddison, Consulting Engineer, to Panhandle Eastern Pipe Line Company, September 30, 1941	13271	4345
General Summary	13272	4347
63, Investors' Appraisal of the Risk of Capital in the Natural Gas Industry as compared with other Divisions of the Utility Industry, Summary of Analyses; prepared by Paul B. Coffman, Vice-President of Standard and Poors Corporation	13321	4349
Table of Contents	13322	4349
Statement of Experience and Qualifications of Paul B. Coffman	13327	4354
Investors' Appraisal of Capital Risks in Various Divisions of the Utility Industry	13348	4371
Statement A, Investors' Appraisal of Risks of Capital for the years 1937, 1938, 1939 and 1940	13351	4373

	Original	Print
Statement A-1, Investors' Appraisal of Risks of Capital for the Interim Period of 1941, January-August, Both Inclusive	13352	4375
Statement B, Investors' Appraisal of Risks of Capital for the years 1937, 1938, 1939 and 1940	13353	4377
Statement B-1, Investors' Appraisal of Risks of Capital for the Interim Period of 1941, January-August, Both Inclusive	13354	4379
Statement C, Investors' Appraisal of Risks of Capital for the years 1937, 1938, 1939 and 1940	13355	4381
Statement C-1, Investors' Appraisal of Risks of Capital for the Interim Period of 1941, January-August, Both Inclusive	13356	4383
Statement D, Investors' Appraisal of Risks of Capital for the years 1937, 1938, 1939 and 1940	13357	4385
Statement D-1, Investors' Appraisal of Risks of Capital for the Interim Period of 1941 January-August, Both Inclusive	13358	4387
Statement E, Investors' Appraisal of Risks of Capital for the years 1937, 1938, 1939 and 1940	13359	4389
Statement E-1, Investors' Appraisal of Risks of Capital for the Interim Period of 1941, January-August, Both Inclusive	13360	4391
Statement F, General Information Covering each Company as to the Nature and Size of the Business and the Territory served	13361	4393
64, Statistics supporting Data, Exhibit 63, Appendixes A, B, and C	13379	4414
Appendix A, Complete List of Companies studied and Reasons for eliminating those not used to determine Investors' Appraisal of Risks of Capital	13380	4414
Appendix B, Securities of forty-three Natural Gas Companies considered Representative of the Industry, etc.	13387	4426

Index, Volume X.

Appendix C, Working Papers showing the Computation of Investors' Appraisal of the Risks of Capital	13398	4446
Water Companies	13399	4447
Electric Operating Utility Companies	13420	4461
Manufactured and Mixed Gas Companies	13465	4501
Natural Gas Companies	13495	4521
65, Study relative to Rate of Return on Panhandle Eastern Pipe Line Company prepared by Paul B. Coffman, Vice President, Standard and Poors Corporation	13533	4547
Table of Contents	13534	4547
Chart No. 1, Main Transmission System of Panhandle Eastern Pipe Line Co. and Subsidiary	13542	4559
Chart No. 2, Growth of Natural Gas Industry in United States of America from 1906 to 1940	13548	4567
Chart No. 3, Consumption of Natural Gas in United States of America from 1919 to 1940	13550	4571
Chart No. 4, Revenue from Natural Gas Consumed in United States of America from 1919 to 1940	13552	4573

	Original	Print
Chart No. 5, Average Revenue per M. C. F. from 1929 to 1940	13554	4575
Chart No. 6, Panhandle Sales by States, vs. Industry Consumption of Natural Gas from 1934 to 1940	13556	4577
Chart No. 7, Trends of Gross Revenue from 1934 to 1940, Panhandle vs. other Pipe Line Companies and Industry	13558	4579
Chart No. 8, Operating Ratio of Panhandle Compared with other Pipe Line Companies from 1934 to 1940	13560	4581
Chart No. 9, Trend of Revenue and Expenses of Panhandle Eastern Pipe Line Company from 1934 to 1940	13562	4583
Chart No. 10, Percent Earned on Invested Capital of Panhandle Based upon Capital Structure	13564	4585
Chart No. 11, Percent Earned on Invested Capital of Panhandle Based upon Net Property, Intangibles and Working Capital	13566	4587
Chart No. 12, Return to Common Stockholders of Panhandle Eastern Pipe Line Company from 1934 to 1940	13568	4589
Chart No. 13, New Tax Bill will reduce Income sharply Computations based on Operations — Twelve Months ended June 30, 1941	13570	4591
Chart No. 14, Percent Earned on Invested Capital of Panhandle Eastern Pipe Line Company — as of June 30, 1941	13572	4593
Chart No. 15, Percent Earned on Invested Capital of Panhandle Eastern Pipe Line Company — as of June 30, 1941	13574	4595
Chart No. 16, Historical Costs of Debt Capital of Panhandle Eastern Pipe Line Company—from 1930 to 1941	13576	4599
Chart No. 17, Effect of 1941 Refinancing of Panhandle Eastern Pipe Line Company	13578	4603
Chart No. 18, Historical Costs of Preferred Stock Capital of Panhandle Eastern Pipe Line Company from 1937 to 1941	13580	4605
Chart No. 19, Earnings — Price Ratios of Natural Gas Pipe Line Common Stocks from 1937 to 1940	13582	4607
Chart No. 20, Current Earnings — Price Ratios of Natural Gas Pipe Line Common Stocks	13584	4609
Chart No. 21, Cost of Financing Northern Natural Gas Company Common Stock — Offered to Public on September 10, 1941	13586	4613
Chart No. 22, Estimated Current Cost of Financing Common Stock of Panhandle Eastern Pipe Line Company	13588	4615
Chart No. 23, Continuing Growth of Panhandle System Indicates Future Needs for New Capital	13590	4617
Chart No. 24, Panhandle Eastern Pipe Line Company Invested Capital as of June 30, 1941	13592	4621
Chart No. 25, Preferred Stock Unusual in Natural Gas Pipe Line Companies	13594	4623
Chart No. 26, Earnings Necessary to Maintain Credit Position of Panhandle Eastern Pipe Line Company	13596	4625

Table No. 8, Classification of Acreage Under Lease, February 1, 1937	14233	4745
76; Panhandle Eastern Pipe Line Company Natural Gas Supply	14243	4746
Letter, Ralph E. Davis, Inc., Engineers, to Board of Directors of Panhandle Eastern Pipe Line Company, November 12, 1940	14244	4746
Summary of Acreage in Amarillo and Hugoton Fields	14248	4751
77, Description of Physical Property of Michigan Gas Transmission Corporation	14251	4753
Testimony of George S. Young	14252	4753
Schedule 1, Compressor Stations	14272	4770
Schedule 2, List of Communities receiving Service from Public Utilities to whom Michigan Gas Transmission Corporation sells Gas Purchased from Panhandle Eastern Pipe Line Company, Population and Number of Customers as of June 30, 1941	14274	4771
Schedule 3, List of Industrial Consumers receiving Service on an Interruptible Basis indirectly from Michigan Gas Transmission Corporation System, June 30, 1941	14277	4779
Schedule 8, Michigan Gas Transmission Corporation Summary of Miles of Pipe by Sizes, June 30, 1941	14295	4781
79, Comparison of Daily provided Capacity to deliver Firm Gas with Maximum Daily Delivery of Firm Gas from System of Michigan Gas Transmission Corporation	14311	4783
79-A, Comparison of Daily provided Capacity to Deliver Firm Gas with Maximum Daily Delivery of Firm Gas and total delivery of Gas from the Pipe Lines owned or operated by Michigan Gas Transmission Corporation for the Winter Period of 1941-1942 to February 27, 1942	14312	4785

	Original	Print
79-B; Total Delivery of Gas from Pipe Lines owned and operated by Michigan Gas Transmission Corporation on Days on which the Delivery of Firm Gas from System was the Maximum	14313	4787
80, Report of Inspection of Equipment in the Compressor Stations of the Michigan Gas Transmission Corporation by H. C. Lehn	14314	4789
81, Depreciation Study, Michigan Gas Transmission Corporation by H. S. Riddle	14321	4794
Letter, H. S. Riddle, Gas Engineering Department, to G. S. Young, Vice President, of Michigan Gas Transmission Corporation, November 10, 1941	14322	4794
Summary of Inspection Data	14323	4795
82, Accrued Depreciation on Compressor Station Structure, measuring and regulating Station Structures and Equipment and other Transmission Structures and general Equipment as of June 30, 1941 by Francis S. Haberly	14369	4796
83, Reproduction Cost new of Plant and Property of Michigan Gas Transmission Corporation as of June 30, 1941 by Francis S. Haberly	14375	4801
Letter Francis S. Haberly, Engineer, to G. S. Young, Vice President, Michigan Gas Transmission Corporation, October 27, 1941	14377	4801
Table of Contents	14378	4802
Statement of Francis S. Haberly	14379	4802
Summary	1438	4810
Reconciliation of Original Cost and of Reproduction Cost to reflect Changes due to Reclassification	14390	4811
Compressor Station Structures and Improvements	14391	4813
All Stations	14391	4813
Montezuma Compressor Station	14392	4813
Zionsville Compressor Station	14398	4818
Edgerton Compressor Station	14402	4821
Other Transmission System Structures and Improvements	14405	4824
All Locations	14405	4824
Montezuma Compressor Station	14406	4824
Zionsville Compressor Station	14407	4825
Edgerton Compressor Station	14408	4826
Mains	14409	4826
Compressor Station Equipment	14416	4831
All Stations	14416	4831
Montezuma Compressor Station	14417	4831
Zionsville Compressor Station	14427	4839
Edgerton Compressor Station	14433	4844
Measuring and Regulating Station Equipment	14437	4847
General Equipment	14438	4848
Office Furniture and Fixtures	14439	4848
Transportation Equipment	14440	4849
Stores Equipment	14441	4849
Tools and Work Equipment	14442	4849
84, Reproduction Cost new less Depreciation of Michigan Gas Transmission Corporation as of June 30, 1941 by Francis S. Haberly	14443	4850

	Original	Print
Summary	14444	4850
Compressor Station Structures and Improvements	14445	4851
Measuring and Regulating Station Structures	14446	4852
Other Transmission System Structures	14447	4852

Index, Volume XI.

Mains	14448	4853
Compressor Station Equipment	14449	4853
Measuring and Regulating Station Equipment	14450	4854
General Equipment	14451	4855
87, Materials and Supplies Restatement of Cost of Major Items as of June 30, 1941; Michigan Gas Transmission Corporation by Francis S. Haberly	14466	4856
Materials and Supplies	14467	4856
88, Michigan Gas Transmission Corporation — Comparative Balance Sheets, per Books as at December 31, 1936 to 1940, Inclusive, and June 30, 1941	14475	4863
89, Michigan Gas Transmission Corporation Statement showing earned Surplus per Books for the Ten Months ended December 31, 1936, years 1937 to 1940, inclusive, year and six months ended June 30, 1941	14477	4867
90, Michigan Gas Transmission Corporation — Statement showing Capital Surplus, per books, for the Ten Months ended December 31, 1936, years 1937 to 1940, inclusive, year and six months ended June 30, 1941	14478	4869
91, Michigan Gas Transmission Corporation — Preliminary Report on Original Cost Studies by Central Service Corporation	14479	4871
Statement A, Outline of Origin and Development	14489	4878
Statement A-1, Common Stock issued and Outstanding at January 1, 1940 and June 30, 1941	14492	4881
Statement B, Statement showing Acquisition by Reporting Company or Predecessors of Gas Operating Unit or System, etc	14493	4883
Statement D, Statement relating to Gas Plant as of January 1, 1940, etc	14494	4885
Statement E, Statement showing Summary of Adjustment relating to Gas Plant, etc	14495	4886
Statement F, Statement relating to Gas Plant as of January 1, 1940, etc	14496	4887
Statement G, Statement relating to Balance Sheet as of January 1, 1940, etc	14498	4891
Statement H, Statement relating to Suggested Plan for Depreciation, etc	14499	4893
Statement I, Statistical Information Relative to Gas Plant at June 30, 1941	14500	4893
92, Michigan Gas Transmission Corporation Statement showing Original Cost Depreciated to present Conditions as at June 30, 1941 and observed Depreciation as at June 30, 1941	14507	4903

	Original	Print
93, Michigan Gas Transmission Corporation — Statement of Contributions made to Customers for Business Development for the years 1936, 1937 and five months ended May 31, 1938	14508	4905
94, Michigan Gas Transmission Corporation Statement showing working Capital as of June 30, 1941	14510	4908
95, Michigan Gas Transmission Corporation — Estimated Cost of Completing work in Progress at June 30, 1941 and Estimated Gross Income to be derived from the Completed Projects	14517	4919
97, Michigan Gas Transmission Corporation — Variation in Purchase Power of Dollar as Related to Gas Plant	14519	4921
Graph relating to Variation in Purchasing Power of the Dollar spent for Main Compressor Units	14522	4923
Graph relating to Variation in Purchasing Power of the Dollar spent for Steel Pipe	14523	4925
Graph relating to Variation in Purchasing Power of the Dollar spent for Station Structure Materials	14524	4927
Graph relating to Variation in Purchasing Power of the Dollar spent for Station Structure Labor	14525	4929
Graph relating to Variation in Purchasing Power of the Dollar spent for Station Equipment Labor	14526	4931
Graph relating to Variation in Purchasing Power of the Dollar spent for Mains Installations	14527	4933
Statement relating to Variation in Purchasing Power of the Dollar as related to "Gas Plant"	14528	4935
99, Michigan Gas Transmission Corporation — Statement of Income and Expense per books for years ended December 31, 1936 to 1940, inclusive, twelve Months ended June 30, 1941 and six Months ended June 30, 1941 and December 31, 1940	14530	4937
100, Michigan Gas Transmission Corporation — Statement of Income and Expense per books and after Adjustments and redistributions necessary to reflect the 2-6 months Period per books on an annual basis, for six months ended December 31, 1940 and June 30, 1941 and for twelve months ended June 30, 1941	14533	4943
101, Michigan Gas Transmission Corporation — Comparative Statement of Operating Revenues, for years ended December 31, 1936 to 1940, inclusive, twelve months ended June 30, 1941 and six months ended June 30, 1941 and December 31, 1940	14537	4951
102, Michigan Gas Transmission Corporation — Operation and Maintenance Expense per books for the twelve months ended June 30, 1941	14538	4953
103, Michigan Gas Transmission Corporation — Statement showing Gas Sales, Gas Transported, Gas used by Company, Line Losses and Gas Purchased for the years ended December 31, 1936 to 1940, inclusive, twelve months ended June 30, 1941 and December 31, 1940	14540	4957
106, Registration Statement of Panhandle Eastern Pipe Line Company No. 2-4597, filed with the Securities & Exchange Commission November 18, 1940, Excerpts from	14548	4959

Order allowing certiorari	7230	7221

The first well in Oklahoma to be connected is the Arnold, and the line will start at that well, which is near the center of the west half of Section 31, Township 4, Range 17, and it extends to a point in the southwest quarter of Section 30, Township 4, Range 17, Texas County, Oklahoma.

[fol. 4960] It is a 4-inch line, .68 of one mile in length.

The next well is the Banta. The line will start near the center of the south half of the northeast quarter of Section 8, Township 3, Range 16, and will extend to a point near the center of the south half of Section 9, Township 3, Range 16, Texas County, Oklahoma.

It will be a 4-inch I. D. line, .83 of one mile in length.

The next well is the Bartels. The line will start near the center of the northwest one-quarter, Section 30, Township 4, Range 15, and will extend to a point near the center of the northwest quarter of Section 30, Township 4, Range 15, Texas County, Oklahoma. It is a 4-inch I. D. line and .05 of one mile in length.

The next is the Bateman. The line will start near the center of the northwest quarter of Section 8, Township 5, Range 17, and will extend to a point in the southwest quarter of Section 9, Township 5, Range 17, Texas County, Oklahoma. It is a 4-inch I. D. line, 1.20 miles in length.

The next is the Findley. It will start near the center of the north half of Section 16, Township 5, Range 13, and will extend to a point near the northeast quarter of Section 20, Township 5, Range 13, Texas County, Oklahoma. It is a 4-inch I. D. line, 1.38 miles in length.

The next will be the Hammond. The line starts near the center of the east half of Section 19, Township 3, Range [fol. 4961] .16, and extends to a point in the southwest quarter of Section 20, Township 3, Range 16, Texas County, Oklahoma. It is a 4-inch I. D. line, .60 of one mile in length.

The next is the Hoeme. That line will start at a point which is approximately 100 feet west of the center of the east line of Section 9, Township 4, Range 17, and will ex-

tend to a point in the northeast quarter of Section 9, Township 4, Range 17, Texas County, Oklahoma. It is a 4-inch I. D. line, .20 of one mile in length.

The next is the Howell. It starts near the center of the west half of Section 32, Township 5, Range 15, and extends to a point in the southeast quarter of Section 32, Township 5, Range 15, Texas County, Oklahoma. It is a 4-inch I. D. line which is .20 of one mile in length.

The next is the Olsen. It starts near the center of the south half of Section 9, Township 2, Range 16, and extends to a point near the center of Section 11, Township 2, Range 16, Texas County, Oklahoma. It is a 4-inch I. D line, 2.05 miles in length.

The next is the Peerless Oil Company, and the line will start near the center of the north half of Section 23, Township 3, Range 16, and will extend to a point in the northwest quarter of Section 23, Township 3, Range 16, Texas County. It is a 4-inch I. D. line which is .50 of one mile in length.

That is the total of the 10 wells to be connected in the [fol. 4962] State of Oklahoma portion of the Hugoton Field, a total of 7.69 miles.

In Kansas, the first well to be connected on this line is the Berg. The line will start near the center of Section 15, Township 33, Range 34, and extends to a point near the center of the north half of Section 22, Township 33, Range 34, Seward County, Kansas. It is a 4-inch I. D. line, .56 of one mile in length.

The next is the Huxman. The line starts near the center of Section 14, Township 30, Range 34, and extends to a point near the northwest corner of Section 28, Township 30, Range 34, Haskell County, Kansas. It is a 4-inch I. D. line that is 2.80 miles in length.

The next is the Leigh. The line starts near the center of the east half of Section 27, Township 28, Range 38, and extends to a point near the center of Section 25, Township 28, Range 38, Grant County, Kansas. It is a 4-inch I. D. line, 1.70 miles in length.

The next is the Miller. The line will start at a point located in the southwest one-quarter of Section 1, Town-

ship 29, Range 35, and will extend to a point in the northwest quarter of Section 17, Township 29, Range 34, Grant County, Kansas. It is a 4-inch I. D. line, which is 2.34 miles in length.

The next is the Newby. That line starts at a point near the center of the east half of Section 28, Township 31, [fol. 4963] Range 37, and extends to a point in the northeast one-quarter of Section 27, Township 31, Range 37, Stevens County, Kansas. It is a 4-inch I. D. line which is one mile in length.

The next is the Pettijohn. This line starts at a point near the center of Section 14, Township 31, Range 39 West, and extends to a point in the northwest one-quarter of Section 14, Township 31, Range 39, Stevens County, Kansas. It is a 4-inch I. D. line which is .38 of one mile in length.

Another Pettijohn well, from which the connecting line will start at a point near the center of Section 15, Township 31, Range 39, and extend to a point near the center of Section 15, Township 31, Range 39, Stevens County, Kansas. It is a 4-inch I. D. line, which is .1 of a mile in length.

The next is the Pricherd. The connecting line will start at a point near the center of Section 22, Township 31, Range 39, and extend to a point near the center of Section 15-31-39, Stevens County, Kansas. It is a 4-inch I. D. line, which will be one mile in length.

The next is the Sullivan. The connecting line will start at a point which is near the center of the south one-half of Section 5, Township 29, Range 37, and will extend to a point in the northeast quarter of Section 32, Township 29, Range 37, Grant County, Kansas. It is a 4-inch I. D. line, which will be 1.47 miles in length.

The next is the Williams. This line will start near the [fol. 4964] center of Section 32, Township 27, Range 37, and will extend to a point in the southeast one-quarter of Section 33, Township 27, Range 37, Grant County, Kansas. It is a 4-inch I. D. line, which will be .68 of one mile in length.

The total length for the 10 wells located in the Kansas portion of the Hugoton Field will be 12.03 miles.

Q. The next item concerning which I would like to inquire, which appears on Page 31 of Exhibit 42, is Item "h", "Construct additional required gathering lines in the Hugoton Field, costing $149,291."

Will you describe these lines, giving the sizes of pipe and the length of pipe and the location?

A. Yes, sir. The Oklahoma gathering lines are described as follows:

The Arnold gathering line will start at a point in the northwest quarter of Section 26, Township 4, Range 16, Texas County, Oklahoma, and extend to a point in the southwest quarter of Section 30, Township 4, Range 17, Texas County, Oklahoma. It is a 6-inch I. D. line, 1.8 miles in length.

Q. With what line will that connect?

A. That will connect to the general gathering system in Oklahoma. If you would like it more fully described, I can show you on the map.

Q. I think it would be best for you to point to the map in describing these facilities.

[fol. 4965] A. The line just described, which will be called the Arnold gathering line, connects to the 16-inch line which extends in a northeasterly direction from the converging point of the Oklahoma gathering system, and to the east the Arnold well will be connected into this line, which will be drilled during the year 1946.

Q. And that is shown colored in blue on the map, Exhibit No. 46?

A. That is correct.

Q. To which you have just referred?

A. Yes, sir.

The Bartle gathering line will start near the center of the west line of Section 18, Township 4, Range 15, Texas County, Oklahoma, and will extend in a southwesterly direction to a point in the northwest quarter of Section 30, Township 4, Range 45, all in Texas County, Oklahoma.

It will be a 6-inch I. D. line, which will be 1.9 miles in length.

The next line will be known as the Tyrone. Now, we will call this the Tyrone line, because it extends up north to

the vicinity of the Town of Tyrone, and in the laying out and naming of the gathering lines, why, it is well to have some name that everyone understands and can identify that line by, because we don't remember the numbers so well that are on the map as we do the names.

[fol. 4966] The Tyrone line will start at a point in the northeast quarter of Section 12-4-16 and will extend in a northeasterly direction to a point in the southwest quarter of Section 9, Township 5, Range 17, Texas County, Oklahoma. This will be a 6-inch line, which will be 6.3 miles in length.

The connection on the southern end to the 16-inch line, which is really an extension in the same direction of the 16-inch line that runs northeasterly from the central point of the gathering system at Oklahoma—

Q. (Interposing) And which was one that you described as being one of the capital additions to the gathering lines in 1942?

A. In 1942, yes, sir, shown in brown. The line that it connects to is shown in brown, and the line just described is shown in blue.

Q. Now, are there any other gathering lines included in Item "h" on Page 31?

A. Not in the State of Oklahoma, but in Kansas we do build some gathering lines.

The first line will be called the Pettijohn gathering line because it will be built primarily to pick up the Pettijohn acreage or production from the Pettijohn acreage, and it will start at a point in the northeast quarter of Section 4, Township 31, Range 38, Stevens County, Kansas, and extend in a southwesterly direction to a point near the center [fol. 4967] of Section 15, Township 31, Range 39, Stevens County, Kansas. This will be a 10-inch I. D. line, which will be 5.3 miles in length.

The next extension which will be built will be an extension to the Ulysses extension, and the line will start in the northwest quarter of Section 32, Township 28, Range 37, Grant County, Kansas, and will extend to a point near the center of the east half of Section 25, Township 28, Range 38, Grant County, Kansas. That will be an 8-inch line, 4.7 miles in length.

The next line will be known as the Williams gathering line. It will start at a point in the southeast quarter of Section 21, Township 28, Range 37, Grant County, Kansas, and will extend to a point near the northeast corner of Section 33, Township 27, Range 37, Grant County, Kansas. This will be an 8-inch line, which will be 4.5 miles in length.

Q. To what line does that connect?

A. The Williams gathering line will connect on the south to the extension of what is known as the Grant County, 18-inch line. The Grant County 18-inch line—that might be a misnomer, because it is only an 18-inch line from the Liberal intake side of the Liberal compressor station up to a point where a line joins it in the northwest quarter of Section 28, Township 30, Range 34, and then it reduces to a 16, and continues in a northwesterly direction to a point in about the northeast corner of Section 24, Township 29, Range 36.

[fol. 4968] It then reduces in size to a 12-inch line for the next, approximately, 4 miles, and then the extension is a 10-inch line, and that is where the Williams line will connect to the present system on that 10-inch line.

Q. Now, have you described all of the gathering lines that are included within Item "h" on Page 31, Exhibit 42?

A. Yes, that is all.

Q. Mr. Hinton, you have an Item "i" on Page 31, "Construct new compressor station near Town of Hugoton, serving areas west of Hugoton at cost of $362,398," and an Item "j," entitled—

A. (Interposing) Pardon me. I am inclined to think that we have a direction mixed up there. We don't serve areas west of Hugoton from that compressor. It should be east.

Q. Then a correction should be entered?

A. Yes. That is on Page 31, Exhibit 42, under Item "i."

Q. In the second line the word "west" should be changed to "east"?

Mr. Wheat. That is the first "i" appearing on the page?

The Witness: It is questionable there. What that compressor is for is to take care of lowering the pressures west of the station, but the gas will travel to the east, and I thought that that might be clarified a little bit there by showing that the gas will not travel to the west.

[fol. 4969] Mr. Wheat: That is the Item "i", under 1946, is it not?

The Witness: Yes, sir.

Mr. Wheat: The second "i" item which appears on Page 31?

The Witness: That is correct.

By Mr. Littman:

Q. Are you suggesting that the word "west" be changed to "east" on that line?

A. I just brought it up for clarification there.

Mr. Culton: Suppose you point out on the map the areas that will be served around the Town of Hugoton, so that it will be clear.

The Witness: The blue triangle here (indicating) shows the proposed location of this compressor station and, probably, the reason that I said it was to serve areas west of there is because I was thinking that it would take care of these wells (indicating), but inasmuch as there is distribution and transportation in this case, why, it might lead somebody to believe that that gas is going to travel to the west instead of the east.

Mr. Culton: I think your word is all right, if that is the situation, because it does serve the wells that lie west of Hugoton.

The Witness: That is right. I just thought perhaps it should be clarified.

Mr. Culton: I think the language is all right.

[fol. 4970] The Witness: I am not sure but what I interrupted your question there.

By Mr. Littman:

Q. I was then going to ask you to describe those facilities and, also, the facilities embraced by the next item,

"j," "Construct dehydration plant in connection with new compressor station, costing $70,000."

A. All right, sir.

By 1946, it is going to be necessary, in my opinion, to install horsepower to maintain the desired load through that portion of the Hugoton system and, in order to be able to take the amount of gas from that section of Hugoton Field which we would want to take, it will be necessary to install 2600 horsepower and, of course, as soon as that pressure is boosted to a point which is above the critical freeze point in that field, it will be necessary to install a dehydration plant.

The dehydration plant will be built in conjunction with the proposed compressor station.

Mr. Culton: By the way, may I interject this question:

Do you find any difference on the freeze point in the Hugoton Field from that which exists in the Panhandle Field?

The Witness: Yes, there is some difference, and there is considerable difference in various portions of the Hugoton Field as to the type of freeze which we encounter.

Mr. Culton: In other words, there is a greater likeli- [fol. 4971] hood of freeze, even at the same temperature, in the Hugoton Field than there is in the Panhandle Field?

The Witness: Apparently, that is the case, because that is what we have experienced.

Mr. Culton: Do you know why that is?

The Witness: No, I do not.

Mr. Culton: Does there happen to be any difference in the chemical constituents of the gas?

The Witness: Oh, yes. The heat values of the two gases are different and the gasoline recovery is different in the two fields.

Mr. Culton: Do you suppose those differences might have some effect on the difference of the freeze point?

The Witness: Yes, I would say that they do.

Mr. Lee: What is the difference in the heat value?

The Witness: Why, in the Panhandle Field, our range of heat value is from about 1060 to—I don't believe we have any lower than 1020 in that field. That is 30 inches saturated.

Mr. Lee: That is B. t. u.'s per thousand cubic feet?

The Witness: Yes.

Mr. Lee: What did you say, 1020 to 1050 in the Panhandle?

The Witness: 1060. Those figures are approximate.

Mr. McRee: That isn't per thousand, is it? It is per cubic foot, isn't it?

The Witness: Per cubic foot.

[fol. 4972] Mr. Lee: When you speak of that 1020, you speak of it in the hundred-thousands, don't you?

The Witness: No, that is per cubic foot.

Mr. Lee: Yes, that is right.

Trial Examiner: There is an atmospheric pressure there, a density factor?

The Witness: Yes, that is 30 inches saturated, and in the Hugoton Field the highest that I can recall is 1034. The lowest is just below 990, that is on the same 30 inches saturated.

Mr. Lee: Are you familiar with the fact that what is actually delivered to the customer in Detroit varies, approximately, between 990 and 1010?

The Witness: I know there is usually a variation there of about 15 B.t.u.'s, and I don't recall it being down as low as 990.

It usually runs from about 1004 to 1014, in that range there. There might be a few days that it would get down that low, but not many.

Trial Examiner: That is on the same density factor, is it, Mr. Lee?

Mr. Lee: Well, I presume so, your Honor.

The Witness: That is the 14.73. That is the reason we have gone to 30 inches saturated, for comparison. We formerly took those on a 2-pound pressure base, and then we took quite a few heat-value tests on 14.65-pounds pressure base, and then we have started testing to 14.73, be-
[fol. 4973] cause our calorimeters are set to 14.73.

We are establishing heat values by calorimeter tests now, rather than by fractional analyses which we formerly used.

Mr. Culton: That is all I had on that, Mr. Littman. I just thought it might be advisable to bring up the fact that there is a slight difference in the freeze point in the two areas.

By Mr. Littman:

Q. Have you been able to locate your working papers that show the details of the capital additions for the years 1942 and 1944?

A. Yes, sir.

Q. Do you have them with you?

A. No, they are in the air mail from Kansas City right now, and they were not lost at the office of the Federal Power Commission at all, but the loss was due to my method of filing, I believe.

Mr. Culton: We have already discussed that method of filing.

By Mr. Littman:

Q. Do you expect them sometime today?

A. I though that they would be in this morning, but I think that they have an extremely heavy incoming mail into the hotel, and I would imagine that they are there but have not been sorted yet.

[fol. 4974] Q. Well, we can discuss further the years 1942 and 1944 after your working papers arrive.

Mr. Hinton, you made certain assumptions, did you not, with respect to the suction pressures at the various main compressor stations, including Liberal compressor and the stations south and west of Liberal. Is that correct?

A. Yes, I believe you call that an assumption.

Q. Well, you had to use certain figures? A. Yes.

Q. Now, those compressor stations are at Liberal, Sneed, Hansford and Hugoton, are they not?

A. The proposed station at Hugoton.

Q. Now, those suction pressure figures were used in connection with arriving at the figures shown in Exhibit 43, Schedule 5 of Exhibit 43?

A. Yes. They did govern this amount.

Q. Will you state what figures you used for each of those compressor stations, year by year, for the entire period under, first, the basic load and, second, under the anticipated load?

Mr. Culton: Is that suction pressure?

Mr. Littman: Yes. And by "period", I mean through the year 1956.

Mr. Culton: I wonder, so that the record might be clear, [fol. 4975] if we might have him explain just what is meant by suction pressure, since the word is really a misnomer from an actual standpoint.

It is apparently used, but just what do you mean by the words "suction pressure"?

The Witness: The pressure in the pipe line at the intake side of the compressor station.

The Sneed suction pressures for the years 1942 to the year 1957 are estimated to be as follows—

By Mr. Littman:

Q. (Interposing) Now, are these under the basic load, or are these under the anticipated load?

A. These are under the anticipated load, and I don't believe that I carried the basic load pressures on down there, but they can be read from the curves because, as the field pressure declines, then the intake pressure at the Sneed station will be governed by the decline of the field pressure.

Mr. Culton: That intake pressure is what is ordinarily referred to as suction pressure of the station?

The Witness: That is right.

By Mr. Littman:

Q. What is the number of the folder of the working papers that you have before you?

A. No. 11, group area, rock pressure summary, Texas.

Q. What is the number? A. 11.

[fol. 4976] Q. File No. 11?

A. Yes. I have two pressures for Sneed, because we will be dividing the header at Sneed as soon as we install the two additional engines, and by dividing the header, I mean that, on the intake side of the compressor station it is necessary that a pipe be laid parallel to the horizontal length of the compressor station in order that each engine and compressor may have piping removed for an intake and a discharge piping system.

As soon as we install the two additional engines at the Sneed station, there will be a Merco-Nordstrom gate placed in this header, which will enable the station to operate at different pressures from the line, the present 18-inch line and the present 20-inch line.

Do you have the idea now of what will happen?

Q. Yes.

A. So that, for that reason, we have these two Sneed suction pressures.

Now, they are the same for a—

Q. (Interposing) Do you have two trunk gathering lines there?

A. Well, we will have before these engines are installed. The looping was described in "1942, Capital Expenditures", and there will be two lines coming into the station.

[fol. 4977] Q. Now, you are going to read the intake pressures at Sneed compressor station for the years under the anticipated load requirements?

A. Yes.

Q. Now, the first one is for what pipe line?

A. The first will be for the pipe line serving areas "A", "B" and "C".

Q. Which areas are shown on the map, Exhibit No. 46. Is that an 18-inch line running southeast from Liberal compressor station from Sneed?

A. From the Windmill Junction, which is just south of the Sneed station.

Then, this 18-inch line runs in a southeasterly direction to a point just south of the old town site of Deahl, Texas.

Q. Very well. Do you wish to read the figures?

A. For the year 1942, we estimate that we can carry a Sneed intake pressure of 293 pounds,

Year	Pressure, pounds.
1943	285
1944	273
1945	261
1946	247
1947	231
1948	216
1949	208
[fol. 4978] 1950	190
1951	172
1952	154
1953	136
1954	118
1955	100
1956	80
1957	60.

For the group areas "D", "E", "F" and "G", the estimated pressures at the intake of Sneed compressor station will be as follows:

Years	Pressures, pounds.
1942	293
1943	288
1944	276
1945	261
1946	246
1947	228
1948	210
1949	210
1950	192
1951	174
1952	154
1953	134
[fol. 4979] 1954	114
1955	90
1956	70
1957	50.

Mr. Lee: Mr. Witness, are those estimated declines inevitable, or may there be conditions that will result in very little decline over that period of years, as far as pressures are concerned?

The Witness: It could be possible that there would be no decline at all, if everyone would stop taking gas from the field right now.

Mr. Lee: Well, but are there mechanical conditions that can reduce the decline?

The Witness: Not the formation decline.

Mr. Lee: Well, can they reduce the decline so far as getting out the reserves is concerned?

The Witness: Do you mean as far as furnishing these pressures that have been set up for the intake side of the Sneed station?

Mr. Lee: Increasing them, yes.

The Witness: Yes, by spending many thousands of dollars, it would probably be possible to come into this station at a higher pressure by installing horsepower on a decentralized system throughout the entire field.

[fol. 4980] Mr. Lee: Well, you have discussed something about that.

The Witness: Yes.

Mr. Lee: Just one other question—pardon me for breaking in on you there—while you are talking about the decline, is that on the assumption that the decline is throughout the entire area with the present number of wells, or with the prospective number of wells?

The Witness: With the prospective number of wells and the prospective development by others, and an estimate that is based on what is believed will be approximately the amount of gas which will be withdrawn, year by year, from the Panhandle Field.

Mr. Lee: Does it take into contemplation any possible increase in your acreage?

The Witness: No.

Mr. Lee: It is predicated upon the present acreage?

The Witness: But the acreage is not the controlling factor in the life of the Panhandle Field at all. It is the rate of withdrawal.

Mr. Lee: Yes, I understand, but if you went out and acquired 10,000 more acres, virgin acres that may have great gas reserves, that would make a change, wouldn't it?

The Witness: Not particularly, no, not as long as we are operating under the present conditions, because if we went out and added 10,000 acres to our present holdings in the Panhandle Field, it would mean that we would be [fol. 4981] taking a smaller amount of gas from each well, but the same total amount would be taken from the field.

That would mean that other companies would be pulling heavier from adjoining acreage, therefore, the addition of 10,000 acres to our present acreage would have very little influence on the total length of life or the total term in which we could operate in the Panhandle Field.

By Mr. Littman:

Q. Now, Mr. Hinton, will you please state the intake pressures for the Hansford pressure station, first, under the anticipated load?

A. That will be rather easy, because for about the next ten or twelve years, that intake pressure will be 300 pounds, and it will drop off from 300 pounds after that, in the proportion that the Sneed discharge pressure will force it to drop off.

Mr. Culton: Explain that. Does the Sneed pressure control that pressure?

The Witness: Yes, as the intake pressure of the Sneed station declines, it is necessary to maintain the same discharge pressure out of that station, which changes the ratio of compression and means that more horsepower is required to compress the same amount of gas.

Mr. Culton: That is, at the same discharge?

[fol. 4982] The Witness: Yes, at the same discharge.

Now then, the Hansford station is a station that is powered with 650 horsepower units, and in order to get good

efficiency from those engines, it is necessary to hold about the same ratio of compression at all times.

Therefore, we are installing additional horsepower at Sneed so that we can maintain the 300-pound intake pressure at Hansford station, because that will result in the greatest efficiency from the horsepower which we will install.

Mr. Culton: In other words, the intake at the Hansford station is controlled by the output at the Sneed station?

The Witness: That is correct.

By Mr. Littman:

Q. What would you expect the intake pressure at Hansford compressof station by 1956 to be?

A. By 1956, in all probability, there will be additional horsepower installed between the two stations, because at that time we will be using the Sneed station as a two-stage station and will be handling less gas.

Of course, we will not have the pressure drop in the line, because the volume will be down, but, at the same time, we will be starting out of Sneed at a lower discharge pressure, because it will no longer be possible for the six units, which we feel will be the total horsepower installed at Sneed, to pass or compress enough gas to get the gas into Hansford.

[fol. 4983] Therefore, it is anticipated that adjustments will have to be on that line in the form of additional horsepower further up the line; that will be a small unit, probably a rotary blower type of compressor that will take care of that problem as it comes up, and we will still try to hold 300-pound intake at the Hansford station.

Q. Through 1956?

A. Yes.

Q. Can you give us the pressures for the Hansford station under the basic load?

A. It will be the same. That station is designed for a 300-pound to get into Liberal at the proper pressure.

Q. Now, will you state the pressures for the Hugoton station which, according to your testimony, is expected to be constructed in 1946?

A. I have not established a definite pressure for Hugoton Field, because the withdrawal to date has been very low. I mean the total withdrawal from the field.

There is only some 250 or 260 billion cubic feet of total withdrawal, but the past year we experienced a rather sharp pressure decline in that field, and that is the first year that there has been anything like an even heavy withdrawal.

It has been running around somewhere 100 million cubic feet a day withdrawal.

The pressure decline average for the field was between [fol. 4984] six and seven pounds for the past year. It does not take an extremely low pressure in the Hugoton Field to require additional horsepower, because those wells are forced to work at a lower pressure, and I believe that we can get along until 1946 without horsepower, but I am not sure.

However, I know that we will put it off as long as we possibly can, but I feel sure that we will need horsepower in that year.

Q. Well, I ask you for the suction pressures that you would expect to use in 1946 and thereafter for the Hugoton compressor station or, perhaps, I had better say, what suction pressures you did use in arriving at the figures shown in Schedule 5?

A. What suction pressures?

Q. I beg your pardon. Withdraw that. Perhaps I can state it more clearly.

I asked you to state the intake pressures for the Hugoton station which you used in arriving at your production as to the Hugoton Field.

A. 310 pounds gage.

Q. For 1946?

A. Yes.

Q. What about the other years down to 1956?

A. I do not make any attempt to go down through those years. Here we have a field with an estimated re- [fol. 4985] serve of, well, all the way from 6 trillion to 13 trillion, the estimates of various geologists, I believe.

There has been a total of 250 billion feet withdrawn, and anybody that would try to go down through a field that has had no greater withdrawal than that would certainly be sticking his neck out.

Q. Well, I take it that you didn't use any specific intake pressure for purposes of making your estimates with respect to the Hugoton station?

A. Yes, we know that we would use 310 pounds there, because that would get us below our freezing trouble, and if we had horsepower, we know that we would go at least that low, because we would have to install sufficient horsepower to give us a ratio of compression where it would be possible to work with that low intake pressure.

Mr. Culton: You didn't determine or ascertain the capital expenditures for that later period of the life?

The Witness: No, sir.

By Mr. Littman:

Q. The thing I would like to know is whether you used the 300-pound pressure figure?

A. 310.

Q. I thought you said 300.

A. If I did, I should have said—

Mr. Culton: (Interposing) 310 gage is what he said.

[fol. 4986] Suppose he explains what he means by "gage."

The Witness: That is just the pressure that we read by gage without adding anything for the atmospheric pressure.

By Mr. Littman:

Q. Did you use that pressure for the Hugoton compressor station for the year 1946 and subsequent years in arriving at your estimate of production?

A. I feel reasonably sure that we can still maintain 310-pound intake pressure at the side of the proposed Hugoton station in 1946, because we will have looped, by that time, a few of the bottle necks in the present system, and the fact that we have installed horsepower is not due to the inability of the wells to produce a certain amount of gas, but it is because we want to transport a greater

quantity of gas through the present 16-inch line to augment the peak day requirement into Liberal station.

Q. How much decline do you expect by 1956?

A. 1956?

Q. Yes.

A. In what field?

Q. In the Hugoton Field.

A. I wouldn't say.

Q. At the intake of the Hugoton compressor station?

A. If you will tell me what the rate of withdrawal from the Hugoton Field will be, I will give you that figure.

[fol. 4987] Q. Well, I cannot tell you that, of course.

A. And I don't believe anybody else can, therefore, it would be impossible to make an estimate.

Q. What pressure did you use for the intake side of the Hugoton compressor station for 1947?

A. I didn't use it, I didn't go beyond 1946.

Q. Now, what intake pressures did you use for the Liberal compressor station?

A. I am not sure that I can tell you all of those, because those were worked out—Mr. Burnham can tell you when he comes—but they tell us what our discharge has to be, and we do not tell them what their suction has to be.

Do you understand? That is where the main line takes over, at the Liberal station, and they tell us at what pressure we must come into that station.

I am not sure that I can remember all of those, Mr. Littman.

Q. Will you state the pressures at which the field lines come into Liberal compressor station?

A. At this time?

Q. Yes.

A. There is a minimum of 225 pounds. That is a minimum order and the maximum is 385 for the past year.

Q. Well, now, what pressures did you assume for purposes of your study?

[fol. 4988] A. Pressures between 275 and 300 pounds.

Q. For all the field lines?

A. No.

Q. For what field lines?

A. For the Kansas lines on the intake side of Liberal station. The Texas line runs slightly lower than that.

Q. What figure?

A. I believe that we would find that that would average between 250 and 260.

Q. There is more than one Texas line going into Liberal, is there not?

A. Not at this time.

Q. But you expect there will be more than one, inasmuch as you are building some additional facilities?

A. Yes.

Q. Under your anticipated load?

A. That is correct.

Q. What pressures did you assume for those lines?

A. Approximately the same pressures, because as those lines are built, they will be required to transport the same proportional amount of gas that the present system will carry.

Therefore, the ratio of compression to the Sneed station will remain practically as it is, and the incoming pressure or the intake pressure at Liberal station will be approximately the same. That is governed by volume rather than [fol. 4989] design of new lines.

Q. Now, what would you say with respect to the Oklahoma gas coming into the Liberal compressor station?

A. We had hoped to get a production of 1½ million feet per well average and come into the Liberal station at a suction pressure of between 250 and 260 pounds.

That, again, is rather difficult to make an estimate of, because we have no wells in there at this time, and, as you know, we are just completing our first well.

Q. Well now, is that a separate line?

A. Yes, that is a separate line.

Q. Well, have you made any estimate for these various lines for the various years from 1942 down to 1956?

A. Not calculating an estimate, but just going on knowledge. It is one of those things that you know is reasonably close to right, and if you spent six months trying to calculate it, you might not be any closer to being right than just your first instinct of it, carrying on of experience.

Q. Do you have any idea of what the pressures would be in 1956?

A. Where?

Q. At Liberal, for the Kansas line.

A. Oh, by 1956 we will, in all probability, be coming into the intake side of the Kansas station at approximately the same intake pressure as we are using at this time.

[fol. 4990] Trial Examiner: You mean the Liberal station?

The Witness: The Liberal, because by 1956 it is going to be necessary to install many, many more horsepower in that field to come into Liberal station.

Mr. Culton: You mean individual compressors?

The Witness: I mean there will be field compressors of several thousand horsepower each. The reason that this problem will be cared for in this way is because, at the present time, the Liberal station is so designed,—water piping, the headers and the general piping layout of the station,—in such manner that it would be almost an impossibility to add the additional required horsepower to take care of the pressure decline at that point.

Therefore, it is assumed that it will be taken care of at points in the field system.

. . . . . .

[fol. 4991] By Mr. Littman:

Q. Mr. Hinton, you assumed and used certain average well head working pressures in making your estimate for each group, "A" to "G", inclusive, in the Texas Field, did you not? A. Yes, sir.

Q. And that was for each of the years 1942 through 1956? A. That is correct.

Q. Now, there are a good many of such figures, are there not?

A. Yes, there are several.

Q. In order to save time, will you please submit to me a typewritten copy of those average well head working pressures for each of the areas?

A. Yes, if you so desire.

Q. I would prefer it in a statement form and then perhaps we can make it an exhibit and get it in the record in that manner, rather than to take the time to read it into the record.

A. Of course, all of those pressures are in my working papers, but if you prefer to have them typed, why, that can be done. I am sure there is a stenographer available around Washington somewhere.

Q. We would appreciate a statement of those well head pressures.

Mr. Culton: Mr. Littman, I am wondering—that, of course, would be rather lengthy, and I believe there is [fol. 4992] another exhibit we plan to make—I am wondering if there is any possibility that that can be postponed until Saturday, the making of those exhibits, do it Saturday?

Mr. Littman: You mean, you can submit the statement on Saturday?

Mr. Culton: No, I mean wait until that time to prepare it, because I anticipate, during this hearing, the witness won't have much time to do that.

Mr. Littman: That would be satisfactory.

The Witness: It will mean that I will have to go through these detailed sheets and copy all of those pressures on one sheet to get it in exhibit form and, of course, that will take some time.

Mr. Littman: Well, I would certainly be satisfied if we could get them by Saturday.

Mr. Culton: What I had in mind was, he probably would not be able to do it before Saturday, use Saturday for it.

Trial Examiner: I understand you are about to introduce another subject for cross-examination?

Mr. Littman: Yes.

Trial Examiner: Before Mr. Hinton leaves this subject, I will ask him to refer to the rock pressure map of 1940, which is exhibit 26 for identification, and I would like to ask whether the heavy, straight lines marking the southerly boundary of the pressure area as defined on this map are [fol. 4993] arbitrary lines, or do they mark the actual partial boundaries to the south or southwest of that known gas production area?

The Witness: The line referred to, the heavy outline line, is an actual line. It might perhaps be misleading, due to the fact that two parts of the southerly boundary of the field are straight lines.

Those straight lines in the outline boundary show where there exists a known fault, and over to the southwestern part of the Panhandle Field, the fault line is the southern line of the Panhandle Field and, also, the approximate northern line of the known helium field which is used to furnish gas to the helium plant owned by the United States Government, located west of Amarillo.

Trial Examiner: The line to which you refer is the diagonal line in Potter County north of Canadian River?

The Witness: That is correct.

Trial Examiner: And the line in Carson County, which is also a long, straight line, I understand also represents a definite fault?

The Witness: It does represent a definite fault that has been established and located by actual drilling.

Trial Examiner: Thank you.

Mr. Culton: It might be a good idea to state, for the purpose of the record, a fault represents a place where there has been a slippage of the earth so that formations [fol. 4994] which at one time were continuous are now found at one elevation on one side of the fault line, and at another elevation at the other side of the fault line.

The Witness: That is right. A fault is established by the difference in elevations of like formations within a short space.

Mr. Littman: If your Honor, please, I would like to have marked for identification with the next exhibit number, a table entitled, "Future Division of Production Between Fields Considering a Reasonable Expected Load Increase."

Trial Examiner: This will be marked for identification as Exhibit No. 131.

(Exhibit No. 131 was marked for identification.)

Mr. Littman: I would also like to have marked for identification as Exhibit No. 132, a table entitled, "Future Division of Production Between Fields without Consideration for Increased Loads, Pressure Base 16.4 Pounds."

Trial Examiner: This will be marked for identification as Exhibit No. 132.

(Exhibit No. 132 was marked for identification.)

By Mr. Littman:

Q. Mr. Hinton, Exhibits Nos. 131 and 132 were supplied by you in pursuance of my request of the day before yesterday, were they not? A. They were.

[fol. 4995] Q. And they contain dath copied from your working papers?

A. Yes. I would like to explain the asterisk which appears for the year 1946 on the West Panhandle Field on Exhibit No. 131 should not be there.

Neither should the footnote on this exhibit be there, the reason being that you will note that the footnote says, "Beginning this year it is assumed that the J. M. Huber Corporation and Northern Natural Gas Company purchase contracts will be relinquished."

Now, that footnote was copied over by my clerk and should not appear on this. For the purpose of establishing a value for gas purchase contracts, those two contracts were eliminated, but I felt reasonably sure there was a chance that those contracts would be renewed and have carried them down as still being connected to our line in these figures, although they were taken out of the gas purchase contract evaluation.

Mr. Culton: You are referring to Mr. Biddison's testimony in that. You furnished figures to him and he eliminated those figures in valuing the gas purchase contract?

The Witness: That is correct, so if the footnote and the asterisk be marked out, why, this will be correct.

It might be well to make it clear that all of these figures are M. c. f. on a 16.4-pound pressure base, on both Exhibit No. 131 and Exhibit No. 132.

[fol. 4996] By Mr. Littman:

Q. Do I understand your testimony to be that the figures shown in Exhibit 131 for the West Panhandle Field

reflect purchases under the J. M. Huber Corporation and Northern Natural Gas Company purchase contracts throughout all of the years shown?

A. That is correct, yes, sir.

Q. Is my understanding correct that Exhibit No. 131 relates to what you have called, in your Exhibit 42, the "anticipated load" and sometimes the "future expected load"? A. Yes, that is correct.

Q. And the Exhibit No. 132 has reference to the so-called "basic load", is that right?

A. And the basic load is the approximate present load—not the present, the 1940-41 load.

Q. The figures on Exhibit No. 132 in the extreme right-hand column, "Total Main Line" are the total sales figures which were estimated by Mr. Morton, are they not?

A. No, I do not believe they are based entirely on Mr. Morton's estimate. It is a 12-months' load ending—yes, they are six months actual, and six months estimated, is what it is.

Q. That is for the year 1941?

A. 1941, yes, sir.

Q. What about the years 1942 through 1960?

[fol. 4997] A. If you will notice, that figure is constant through all years.

Q. I was speaking of Exhibit 131, Mr. Hinton.

A. Excuse me, I thought you said, 132.

Q. I am speaking of the anticipated load.

A. Yes, those are Mr. Morton's estimated figures.

Q. Weren't there some adjustments made from Mr. Morton's sales figures to arrive at those shown in the extreme right-hand column, Exhibit No. 131?

A. Yes, these do not represent sales at all. These figures are production figures and the title, I believe, will make it clear, "Future Division of Production Between Fields."

Mr. Morton's figures were handed to me on the basis of sales. From that we have determined, through years of operation, about what percent of line loss we can expect to encounter, and we know, by many years experience and operation, about what fuel will be required for the compressor stations.

Therefore, that amount of gas is added to the sales to establish the required input at the Liberal compressor station.

Mr. Culton: Does this include gas used for testing and clean-outs and things like that?

The Witness: No.

Mr. Culton: It is only the gas that goes into the line?

The Witness: Line loss. In other words, if we would have a serious line failure, why, that gas would not come [fol. 4998] in as a flat percent application to the sales load.

Mr. Culton: What I am getting at, though, do you include in this the gas which is used in testing the wells or clean-out jobs, or things like that, or would that be in addition to this?

The Witness: No, sir, as I have said, this is the required amount at the intake side of the Liberal station.

By Mr. Littman:

Q. And you have also made an adjustment to a 16.4 pound pressure base, have you not?

A. Yes, our sales are on a 14.73, or 30 inches of mercury, saturated, and our field pressures, our production pressures, are on a 16.4 pound pressure base.

Q. On Page 38 of your written testimony contained in Exhibit 42, in the last paragraph, you state that you developed a pressure trend curve for the Panhandle Field as a whole, based on past performances and on the assumption that the pressure reports of the Texas Railroad Commission are accurate. Is that correct?

A. That is right.

Q. Will you produce that pressure trend curve?

A. Yes.

Mr. Littman: Mr. Examiner, I would like to have marked for identification as Exhibit No. 133, a chart entitled, "Panhandle Field, Texas, Pressure Trend." May this be marked?

[fol. 4999] Trial Examiner: This proposed exhibit will be identified as Exhibit No. 133.

(Exhibit No. 133 was marked for identification.)

By Mr. Littman:

Q. I hand you Exhibit No. 133, Mr. Hinton, and ask you if this chart shows the curves to which you referred in the testimony to which I just alluded a moment ago?

A. Yes, it does.

Mr. Littman: If your Honor please, we do not have copies of this chart.

Mr. Wheat: Possibly it won't be necessary, on this particularly technical chart, Mr. Littman, to bother about copies.

Mr. Littman: We are having marked for identification as exhibits our own copies. Perhaps we can later determine whether we want additional copies or not.

Mr. Culton: We have no point about it.

Mr. Littman: You have the tracings for this chart, have you not?

The Witness: Yes, I do.

Mr. Littman: And copies could be readily made if they are required?

The Witness: Right.

Mr. Littman: Are the tracings in Kansas City?

The Witness: They are.

By Mr. Littman:

[fol. 5000] Q. Was the curve shown in Exhibit No. 133 developed from data contained in your working papers, which data are shown in a sheet of your working papers which I now hand you? A. Yes, it was.

Mr. Littman: I would like to have marked for identification as Exhibit No. 134, the sheet I just handed the witness, entitled, —

The Witness: (Interposing) But not this sheet alone. This is the application of withdrawals applied to the performance of the field. This is a portion of the calculations used in extending the curves.

Mr. Littman: Well, am I correct in understanding that the sheet of your working paper, a photostatic copy of

which I now hand you and which I will have marked for identification, does contain certain data from which you derived the curves shown in Exhibit No. 133?

The Witness: That is right. This is the past production and estimated future production from the Panhandle Field, Texas, on a 16.4 pressure base.

Mr. Littman: I would like to have marked for identification the photostatic copy of one sheet of Mr. Hinton's working papers, which is entitled, "Past Production & Estimated Future Production from Panhandle Field, Texas, 16.4 Pound Pressure Base," as Exhibit No. 134.

Trial Examiner: It will be so marked.

[fol. 5001] (Exhibit No. 134 was marked for identification.)

By Mr. Littman:

Q. Doesn't Exhibit No. 134 contain the data from which you plotted the curves which appear in Exhibit No. 133?

A. It contains the result of previous data, and the curves were plotted from this result marked in Columns A, B and C.

Q. Now, I would like to have you explain the source and derivation of the figures shown in Exhibit No. 134.

At the left hand column, you show the years first in 1926 and earlier, and then each of the years 1927 down through 1960, do you not?

A. That is correct, as far as the annual withdrawals are concerned. The pressures are not shown for years previous to 1935, because it was impossible to obtain data to establish those pressures.

Q. Well, I was just talking about the column headed "Year" for the present.

Now, are those calendar periods from January 1 to December 31 of each of the years shown?

A. Yes, those are calendar years.

Q. Now, in the second column, you show figures which are called, "Annual Withdrawal M. M. C. F."

Now, what do those figures represent?

A. The annual withdrawals from the Panhandle Field, Texas.

[fol. 5002] Q. Now, the first figure of 247,425 M. m. c. f. represents the amount of gas withdrawn from the beginning of the Panhandle Field through the calendar year 1926, is that correct?

A. As nearly as it was possible to obtain a correct figure at that time of the unmetered gas that there was. There was a considerable quantity of gas estimated for that year.

Q. What is the source of those figures headed, "Annual withdrawal"?

A. For the year 1926 and earlier—

Q. (Interposing) Well, for all the years shown. If the sources are different for the various years, you might give each.

A. They are different. Up to the year 1935, I might say midyear, 1934, those figures shown are from a combination of actual metered gas and the best judgment that Victor Cotner and H. C. Crum were able to apply to the unmetered gas.

I have talked to Mr. Cotner in detail about how he went out and gathered this information and I feel that, as far as the actual gasoline plants and the metered gas is concerned, that those figures shown are fairly close to accurate.

However, I do not think that this represents the total amount of gas that came from the Panhandle Field.

Q. You mean the amount that has been taken out is larger than that represented by the figures shown in your column headed, "Annual Withdrawal" on Exhibit No. 134?

[fol. 5003] A. Yes, I think it is larger and there is more than one certain specific thing that leads me to believe that.

One is the action of pressure curves, of which I have probably plotted a hundred in the last ten years on this field, trying to arrive at some method of finding what we could expect in the future, and the other is the fact that we know that there has been a great deal of gas produced

from this field through oil well production which has been termed as "casing head gas."

Q. And the casing head gas is not included in the figures headed, "Annual Withdrawal"?

A. Not up to that time, because it was not compulsory to meter casing head gas. There was no gas-oil ratio, and it was possible for an oil producer to use any amount of gas that he desired, to produce a barrel of oil.

Q. Up to what time?

A. Let's see, I believe that started in the early part of 1935, but I am sure that by August, 1935, that it was effective.

Q. In other words, the figures after August, 1935, include the casing head gas?

A. They do include the casing head gas.

Q. But prior thereto—

A. (Interposing) No, it is just an estimate of it, and it is pretty difficult to make an estimate of casing head gas.

[fol. 5004] It is fairly easy to make an estimate of gas that is used in gasoline plants and that is not metered because it is possible to know the capacity of those plants, but when you are just producing gas to the air, it is a pretty difficult proposition to make too accurate an estimate of it.

Q. Now, have you given all of the sources of the figures shown in the column headed, "Annual Withdrawal"?

A. I believe that there is some consideration given there to gas blown to air, that is, after the year 1935.

Q. I believe you explained that you secured the figures through the year 1935 and prior thereto from an estimate made by Messrs. Cotner and Crum?

A. Prior to that date, yes, sir.

Q. Prior to 1935? A. Yes.

Q. Now, what is the source of the figures from January 1, 1935, to the end of 1940?

A. The Railroad Commission records.

Q. Of Texas?

A. Of Texas, along with certain additions which it was felt should be added to give consideration to the pound decline and not getting a warped idea of potential recovery, the addition being that of gas necessary in the drilling in of new wells and the blowing of old wells, both

during maintenance periods and for the purpose of cleaning well bores.

[fol. 5005] Q. Then the figures include, as they stand in the second column of this exhibit, the total gas production from the Texas Panhandle Field?

A. Yes, as nearly as it can be estimated along with the well-established data, that is, the metered gas.

Q. Including casing head gas? A. Yes.

Q. Throughout all of the years shown?

A. Not all of the casing head gas up to 1935, because at that time they were paying particular attention to the gasoline plant use, rather than trying to trace down casing head gas.

Q. Do your working papers contain and show the assembly of the figures from the various sources that you have described?

A. I am not sure whether they do or they do not. If mine don't, I believe that those of Rufus Smith will probably show those.

You understand, in getting up a list of figures like this, it is necessary to almost go and visit with the [follows] who have compiled these figures in the early days, to feel sure that they may be depended upon and I have talked with Mr. Peterson, and he has compiled a great many figures; Mr. McCue of the Columbian Fuel Company.

I have talked with Mr. Cotner and I have talked to Mr. Hughes, and I talked to Mr. Massa. All of these gentle-[fol. 5006] men have lived in the Panhandle with this gas field, and I believe that the figures shown here are about as accurate as could be obtained, but I am not sure that I do have the details showing how these figures were finally reached.

Mr. Culton: Mr. Hinton, can you tell us who these gentlemen are? I do not know whether the record shows as to all of them or not?

The Witness: Mr. Peterson is geologist for the Texoma Natural Gas Company, and Mr. McCue is a scout out of the Amarillo office of the Columbian Fuel Company, and Mr. Cotner is Vice President of the Columbian Fuel Company who lives in New York now. He moved up there recently.

Mr. Massa is a consulting engineer at Pampa, Texas, and Mr. Hughes is a consulting geologist at Amarillo, Texas.

Mr. Culton: Mr. Massa was in charge of the Pampa office of the Railroad Commission for a number of years, was he not?

The Witness: He was. He is probably more familiar with the old records of the Railroad Commission at Pampa than anyone you would be able to contact.

By Mr. Littman:

Q. We have Mr. Smith's working papers, and will ask you to refer us to the breakdown and the various sources for these figures shown in Column 2.

A. There may be some slight discrepancy between the two sets of figures where matters of judgment entered in, [fol. 5007] but they will be very close.

Q. Perhaps during the noon recess we can have the breakdown of the figures and the sources? A. Yes.

I am glad to learn that you have Mr. Smith's papers, because I was held responsible for them, and I did not know where they were.

Q. Now, the figures in the third column headed "Cumulative Withdrawal M. M. C. F." are simply the cumulative figures for the years shown, are they not?

A. That is correct.

Q. Will you state the source of the data shown in the next column, headed "Pressure Decline, Well Head Gage"?

A. That comes from the data of the Railroad Commission of Texas.

Q. Wouldn't it be more correct to say that the figures shown in the column headed "Pressure Decline" represent the remaining well head pressures for each of the years 1935 to 1939?

A. In all probability, that would be an improvement on the heading which I have.

Q. We just wanted to make certain that we understood these figures.

A. I think it would be clearer that way, yes, sir, Mr. Littman.

[fol. 5008] Q. Now, as of what date or dates are these pressure readings which are shown in Column 4?

A. Those are midyear pressures.

Q. Over what period are they taken?

A. Do you mean how many months does it take to take the pressures in the field?

Q. Yes.

A. It is according to how many engineers they can get from Texas A. and M. and Texas University.

Q. By "they", you mean the Texas Railroad Commission?

A. The Texas Railroad Commission. If they have a good bunch of young engineers available, why, it does not take so long, but last year we had to wait for a long time before we could even start on ours, because there was a shortage on engineers.

I would say that if they had engineers, that it would take about three months to take all of the well head pressures in the field.

Q. And the three-month period might be longer, or might be less for each of the years? A. That is right.

Q. And it might start and end at different dates in each of the years?

A. Yes, it would in all probability be within the vacation period, that being along about the first of July until [fol. 5009] the first of September.

Mr. Culton: I wonder if it would help the record to have the witness say what has to be done in taking those pressures?

The Witness: In the matter of just taking pressures, we are using the dead weight gage now, and all that is required is to make a connection of the dead weight gage on a pressure tap at the well head, and balance the dead weight gage against the well head pressure.

Mr. Culton: Has that always been the practice?

The Witness: No, sir, there were very few dead weight pressures taken prior to 1939.

Mr. Culton: At the time these pressures are taken, are the potentials also taken?

The Witness: They always have been, up until the past year, and the past year they were so late getting started that instead of taking potentials, they merely took well head pressures and declined the 1940 back pressure open flow tests on the basis of the pressure drop.

This is the first year that potentials have not been taken along with the pressures.

Mr. Lee: What do you mean by "potentials"?

The Witness: The open flow, more commonly known.

By Mr. Littman:

Q. You just referred to the "Past year". What year [fol. 5010] did you mean?

A. 1941 is the first year that potentials have not been taken in midyear since the Railroad Commission started to function.

Q. In the next column headed, "Estimated Annual Withdrawal, Condition No. 1, M. M. C. F.", you have certain figures running from 1941 to 1960, inclusive.

Will you please give the source of those figures?

A. Those figures are my own estimate, which was made by talking to various representatives of other companies, by knowing that the carbon black load will, in all probability, remain approximately as it is, and studying the weekly reports which I get, which is a comparison of the amounts of gas taken by each major pipe line company from this field, and the amounts that I have put down here are based upon those things.

Q. Do these weekly reports have a title? A. Yes.

Q. What are they called?

A. Comparison of Deliveries, I believe it is. I might have a copy here. If I don't, I have them at the hotel.

Q. Who publishes the paper?

A. They are published by all of the major pipe line companies producing gas in the Panhandle Field, and they furnish this data to a stenographer in Amarillo each week, who types it and sends copies to the various companies. [fol. 5011] Q. We would like to have the title of that weekly paper, if you can give it to us.

A. I do have a file over at the hotel on it, and I will bring it back after lunch.

Q. Very well. That weekly paper does not make any estimate of the amount of gas expected to be withdrawn in the future, does it?

A. No, sir.

Q. But you have based your estimate for the next 19 or 20 years upon that information, is that correct?

A. Not altogether, no.

Now, in the column of figures that we are referring to at this time, you will note that there is no increase shown from 1941.

That reaches its maximum in that year.

Q. The figure being 610 million M.c.f.?

A. That is right.

Q. Were you going to say something further about that? A. No, sir.

Q. Now, you refer to a "Condition No. 1" at the head of that column. A. That is right.

Q. Will you explain what that condition represents?

A. Condition No. 1 contemplates that the rate of withdrawal from the Panhandle Field will remain static, or [fol. 5012] approximately what it was during the year 1941.

Q. Now, you have a column of figures further on, headed "Estimated Annual Withdrawal, Condition No. 2."

A. Yes.

Q. Will you explain the meaning of Condition No. 2?

A. The annual withdrawal estimated under Condition No. 2 is based on the assumption that all other companies will continue to produce gas in the same quantities as in 1941, but that Panhandle Eastern will increase its rate of withdrawal in accordance with Schedule 5, Exhibit 43.

Q. That is, in accordance with Mr. Morton's estimate of future sales?

A. Yes, sir, adjusted for line loss and pressure base and fuel.

Q. Now, you have another column that contains a somewhat similar set of figures, headed "Estimated Annual Withdrawal, Condition No. 3."

What condition does that represent?

A. That represents the condition which I feel will be the actual condition, and that gives consideration to increased withdrawals by not only Panhandle Eastern, but by some of the other pipe line companies taking gas from the Panhandle Field.

Q. That condition, you say, represents more nearly the condition which you would expect to prevail in the next [fol. 5013] 19 or 20 years?

A. Yes.

Q. And it includes the increased production, not only of Panhandle Eastern, but of other pipe line companies?

A. That is correct.

Q. And what is the source of those figures?

A. Well, of course, ours is based on Mr. Morton's estimate of sales. We know that Texoma is not looping their pipe line into Chicago to carry the same amount of gas, and there has been an estimate made for that purpose.

I might say that the increases shown here are all for pipe line gas, and does not include any increase in the gasoline and carbon black plants in the Panhandle nor of the local market there.

Q. You do not expect any increases in that regard, do you?

A. Well, I am hoping for that, anyway. I believe that is right, because those plants now are operating and have been at fairly full capacity, and I do not think that they are going to be able to get material to build plants very soon, even if they wanted to, but I do not believe they are going to build more carbon black plants in that field.

Q. Mr. Hinton, did you consult with any of the other pipe line companies that operate in the Panhandle Field in arriving at this particular estimate of Condition No. 3, [fol. 5014] or was it your own study?

A. I would say that it was largely my own, because I do not recall going to any individual of any company and asking them how much gas they were going to produce over the next few years, and asking them to furnish the detail of it; but it is one of those things that you just get to know by being around the field.

. . . . . .

[fol. 5015] By Mr. Littman:

Q. Mr. Hinton, just before the noon recess, we were discussing Exhibit No. 134.

A. That is the photostatic sheet.

Q. That is the photostatic copy of your working sheet entitled, "Past Production and Estimated Future Production from Panhandle Field".

Now, you have letters "A", "B", and "C" shown on this chart. Will you please explain what those letters mean?

A. The letter "A" covers the three columns which show the annual withdrawal based on no change in withdrawal from the approximate 1941 rate of production.

The next column merely is a cumulative withdrawal, which is obtained by adding to the total withrawal the annual withdrawal.

The third column is the remaining pressure at the different stages of the total withdrawal from the field.

Q. Well, then, am I correct in understanding that the letter "A" applies to those three columns that you just described?

[fol. 5016] A. That is correct.

Q. And am I correct in understanding that the letter "A" means Condition No. 1? A. That is correct.

Q. And the letter "B" applies to the next three columns, that is, the middle three, and refers to Condition 2?

A. Yes, sir.

Q. And the letter "C" refers to the last three columns on the right-hand side of the page and refers to Condition 3?

A. That is correct.

Q. And you have described those three conditions in your testimony this morning, have you not?

A. Yes, sir.

Q. Now, will you please state the source of the figures which appear in the three columns headed, "Estimated Pressure Decline", Condition No. 1, Condition No. 2 and Condition No. 3?

A. The source of those estimated pressures comes from the result of the application of future estimated withdrawals based upon past field performance.

Q. In other words, these rock pressure figures, which I believe you have already explained, really represent

the rock pressure average for the entire Panhandle Field for each of the years shown, for 1941 through 1960 and are estimated, are they?

A. They are. Naturally, any future figure would have to be an estimated figure.

[fol. 5017] Q. Is the 1940 figure for the three conditions relating to the rock pressure estimated?

A. No, it is not.

Q. That is an actual figure, based upon the reports of the Texas Railroad Commission?

A. That is right, it is data compiled by the Railroad Commission of Texas.

Q. Now, I would like to make certain that I understand these rock pressure figures.

Referring to the column headed, "Estimated Pressure Decline, Condition No. 1", you show 314.10 pounds in 1940. Is that correct?

A. That is correct. That is a weighted average figure, and not an equilibrium figure.

Q. Now, all the figures you show in Exhibit 134 relate to the entire Panhandle Field, do they not, both East and West?

A. Sweet and sour.

Q. And East and West?

A. East and West, yes, sir.

Q. Now, the 314.10 pounds of rock pressure is the Texas Railroad Commission's estimate of the average rock pressure throughout the entire Panhandle Field as of the middle of the year 1940? A. That is correct.

Q. Are you sure that doesn't mean as of the end of the [fol. 5018] year 1940?

A. That is mid-year 1940, because that would be the only time that that figure could be obtained.

Q. But the estimated cumulative withdrawal figure shown in the column to the immediate left represents the figures of withdrawals as of the end of the year 1940. Is that correct?

A. I believe that is correct, yes.

Q. Now, in 1941, under Condition 1, which you also refer to as Condition "A", you show that the rock pressure has declined to 303.07 pounds.

A. That is right.

Q. Now, does that mean that after the 610 million M. c.f. have been taken out in the year 1941, that such with-

drawal will produce a rock pressure decline from 314.10 pounds to 303.7 pounds?

A. Yes, sir, a total decline of 11.03 pounds.

Q. Mr. Hinton, I hand you a copy of the Texas Railroad Commission's annual report for the Panhandle oil and gas field, dated July, 1940, and ask you to please check this report and make certain that your rock pressure figures are as of the middle of the year, rather than as of the end of the year shown.

A. The pressure shown there is as of the end of the year 1940, instead of midyear, as I believed them to be. The weighted average pressure at the middle of the year on the total acres in the Panhandle Field was 318.33, and the de- [fol. 5019] cline from the middle of the year to the last of the year by extrapolation of the pressure curves gives the 314.10 pressure.

Q. And is it a fact that all of the rock pressure figures that you show in Exhibit 134 are as of the end of each of the years shown, instead as of the middle of the years shown, as you have previously testified?

A. Yes, that is right. I recall now that I did do that in order to avoid splitting up the production into midyear periods, which means that we would have to take those from the records month by month instead of in annual figures, so I do remember now that I used the last-of-the-year figures throughout the curves.

Q. And throughout Exhibit 134? A. Yes, sir.

Mr. Culton: You extrapolated to get that figure?

The Witness: That is right. Of course, it is all obtained by extrapolation of past performance, and it was just as easy to go to the end of the year as it was to the middle of the year.

Then I wouldn't have to split my estimated annual withdrawal, because, in order to do that, I would have to go back and obtain the history to find out what percent was produced the first six months, and what percent was produced the last six months of the total year.

By Mr. Littman:

Q. Well, I merely wanted to make certain that we under- [fol. 5020] stood your table.

A. Well, I am grateful to you for straightening me out on that, because we so often work to midyear pressures that

I had in mind that I worked this problem in that manner, but I see that I haven't.

Q. Mr. Hinton, would you mind if we were to number the columns in Exhibit 134 in order to facilitate the cross-examination?

Starting with the column headed, "Year", suppose we call that Column 1, and then go right across from left to right until we reach Column 13?

A. I think it is a very good idea.

Would you mind numbering that last column so we don't have 13 columns on this sheet?

Q. It is all right with me. What do you want to call the last column?

A. We wouldn't have to refer to it, but the number will be on there.

Q. Referring now to Column 7, is my understanding correct that at the end of the year 1942, you estimate that the average rock pressure throughout the Panhandle Field as of December 31, 1942, will be 291.26 pounds, as compared with 303.07 pounds at December 31, 1941?

A. That is correct, keeping in mind that these are all weighted with horizontal acreage.

[fol. 5021] Q. These are weighted?

A. With horizontal measurement of acreage.

Q. And in order to produce that drop in rock pressure, 610 million M. c. f. will have been withdrawn in the calendar year 1942, as shown in Column 5?

A. That is correct.

Q. That same method holds true throughout the balance of Columns 5 and 7, is that correct?

A. That is correct.

Q. And the same general method holds true for Columns 8 and 10?

A. That is correct.

Q. And for Columns 11 and 13?

A. That is correct.

Q. Now, I believe you have testified that the rock pressure decline from December 31, 1940, to December 31, 1941, under Condition "A", for example, would be 11.03 pounds? A. That is correct.

Q. And the drop for the next year, and that is to December 31, 1942, would be 11.81 pounds. Is that right?

A. That is correct.

Q. Let's go further down Column "A". Looking at the figures for 1949, your rock pressure reading as of December 31 of that year is 194.90 pounds, is that right?

A. That is correct.

[fol. 5022] Q. And as of December 31, 1950, the rock pressure reading is 178.95 pounds. Is that right?

A. That is right.

Q. A drop of 15.95 pounds between those two years. Is that right? A. That is correct, yes, sir.

Q. And what production do you estimate will have occurred in the Panhandle Field in that calendar year?

A. 610 million M. c. f.

Q. And that is the same amount under Condition "A" or Condition 1, which you stated would be withdrawn in 1941. Is that correct?

A. That is absolutely correct.

Q. Now, in 1941, according to this table, the production of 610 million M. c. f. produced a pressure drop of 11.03 pounds, as compared with 15.95 pounds for the same production in 1950.

A. That is correct.

Q. All of which indicates that you assumed that there would be less production per pound of drop in rock pressure in the Panhandle Field. Is that right?

A. Yes, sir, it is assumed that the field performance will continue in the same manner as heretofore.

Q. Now, without going through each of the comparable columns and all of the figures in each column under Condi-[fol. 5023] tions "A", "B" and "C", sometimes called Conditions 1, 2 and 3, the same situation generally prevails in Exhibit 134, does it not? A. Yes, sir.

Q. Namely, that you have an accelerated drop in rock pressure per million M. c. f. of gas produced?

A. That is correct. In all cases past field performance has been carried to the future.

Q. Now, you developed a line or curve for purposes of arriving at the future production per drop in rock pressure, did you not? A. Yes, sir.

Q. Do you have that curve, or the chart upon which that chart was plotted in your working papers? A. I do.

Mr. Culton: Which area is that?

The Witness: This is for the field.

Mr. Littman: If your Honor please, I would like to have marked for identification as Exhibit No. 135, a chart called "Panhandle Field Performance-Rate of Pressure Drop from 1935 to 1940".

Trial Examiner: It will be so marked.

(Exhibit No. 135 Was Marked For Identification.)

By Mr. Littman:

Q. Referring to Exhibit No. 135, is that the chart to [fol. 5024] which you just referred as being the chart on which you worked out the rate of production per pound of rock pressure decline? A. That is correct.

Q. Now, if I correctly understand this chart, the vertical readings show the rock pressure decline throughout the entire Panhandle Field in weight, is that correct?

A. Weighted only horizontally. There is no vertical weighting of the area.

Q. And am I correct in stating that the horizontal readings show the withdrawals in trillions of cubic feet?

A. That is right. The total withdrawal from the Panhandle Fields.

Q. Now, looking over at the extreme left hand side of your chart, Exhibit No. 135, the one represents 1 trillion cubic feet, does it not?

A. That is right.

Q. And how many pounds of decline in rock pressure, according to this chart, was required to produce that first billion M. c. f. out of the Panhandle Field?

A. The first trillion?

Q. Yes.

A. Why, according to this chart here, 6.62 pounds were required; but, if you will notice, I have made this a broken line from 1935 back to the beginning of the field, because, in my opinion, the total amount of gas that has been ac- [fol. 5025] cumulated to this date does not represent the total amount of gas that has actually been taken from the field, because I am sure that there has been a great deal of the gas that does not show in those figures that has been produced through oil wells.

Mr. Culton: That is during the early years, prior to 1935?

The Witness: That is right.

By Mr. Littman:

Q. I was asking these questions at this time, Mr. Hinton, primarily for the purpose of ascertaining how this chart, Exhibit No. 135, works.

We can discuss those phases a little later, but what decline in rock pressure was required, according to this chart, to produce the first trillion?

A. 6.82 pounds.

Q. What decline in rock pressure was required to produce the second trillion? A. Approximately 8.2.

Q. Now, you are reading these figures at the point where the dotted line crosses the line designated "2", at the bottom of the chart; is that correct?

A. That is correct.

Q. And according to this chart, what decline in rock pressure was required to produce the third trillion?

A. 9.63 pounds.

[fol. 5026] Q. Will you state the amount of rock pressure decline required to produce the fourth trillion?

A. That is approximately 11.2 pounds.

Q. In other words, each successive trillion cubic feet of gas that is withdrawn from the Panhandle Field, according to this chart, if taken literally, requires a greater amount of rock pressure decline, does it not, or brings about a greater decline in rock pressure?

A. That is so shown by taking the horizontally weighted pressures from 1935 through 1940, and placing a dot on the chart to represent the decline for the amount produced at the stages of total withdrawal from the field.

Now, I said yesterday that I did not feel that there had ever been a true equilibrium pressure reached in the Panhandle Field. If it were the case that there had been a true equilibrium pressure reached in this field each year, then the application of Boyle's Law to this problem would place these dots in a perfectly horizontal line that would be exactly straight across the paper.

Q. If I correctly understand your last answer, if Boyle's Law were to be applied, and if there were no devia-

tion from Boyle's Law, then you would have across this chart a straight, horizontal line, rather than the descending line shown on this chart.

A. That is correct.

[fol. 5027] Q. In other words, if you had a straight, horizontal line across this chart, you would have a uniform drop in rock pressure for each trillion cubic feet produced in the Panhandle Field throughout its life. Is that correct?

A. Yes, sir.

Q. Now, what drop in rock pressure is shown by your chart, Exhibit No. 135, in order to produce the fifth trillion cubic feet?

A. 12.42 pounds.

Q. Now, that brings us pretty close to the year 1935, does it not?

A. That is correct.

Mr. Culton: By the way, could you tell us what the aggregate is, up to that time?

The Witness: Aggregate production, do you mean?

Mr. Culton: The aggregate drop.

The Witness: Yes. That would be approximately 353 pounds.

Mr. Culton: That is down to 350?

The Witness: Yes, that would be the average weighted pressure, weighted only horizontally, for the entire field. The original pressure is generally taken to be 430 pounds.

However, pressures higher than 430 pounds were recorded in the yearly days in portions of the field.

By Mr. Littman:

Q. So the 435-pound figure is the average, is it not?

[fol. 5028] A. No, I think 430 is the accepted pressure, original pressure.

Mr. Culton: You are thinking of Hugoton.

By Mr. Littman:

Q. Now, as of what date did you just give the information requested by Mr. Culton?

A. At the beginning of 1935.

Q. By the way, a moment ago I asked you to describe the vertical readings on this chart and, perhaps, I may have been a little misleading.

Would it be correct to say that the vertical readings on the chart, Exhibit No. 135, really represent the rate of drop in rock pressure?

A. Yes; sir. I think the vertical captions, more properly described, would be the rate of pressure decline in pounds based on the weighted average itself, being based only on the application of the horizontal surface, and not giving consideration in any place to the thickness of pay in the field.

Q. Now, we have reached the portion of your line which is solid. That extends from a point slightly beyond the fifth trillion cubic feet, to a point slightly beyond the eighth trillion cubic feet.

Is that, generally, the production that was taken from the Panhandle Field between 1935 and approximately 1940?

[fol. 5029] A. That is correct. That is the amount of gas produced for that period.

Q Now, let us take 1940 as an example, particularly the eighth trillion cubic feet measurement. Will you state the decline in rock pressure required, according to your chart, to produce the eighth trillion?

A. 16.62 pounds.

Q. Now, let's look at a few of the units into the more distant future. Let us take, for instance, the fifteenth trillion. What decline is required to produce that single fifteenth trillion?

A. That will be about 26.47 pounds.

Mr. Culton: 47 or 37?

The Witness: 26.47 is what I read on the chart.

Mr. Culton: Right.

By Mr. Littman:

Q. Now, the last figure you show is for the 21st trillion cubic feet that will be taken out of the Panhandle Field. Will you give us the rock pressure that you estimate will be required to produce that 21 trillion?

A. If and when it is possible to take 21 trillion cubic feet from this field, the amount of pressure decline that will be experienced at a comparable rate of withdrawal will be 35.2 pounds.

[fol. 5030] Q. In other words, it will require approximately 35 pounds of rock pressure drop to produce the 21st trillion cubic feet in the Panhandle Field, if and when it is produced, as compared with a drop of slightly more than 5 pounds to produce the first trillion cubic feet. Is that correct?

A. That is based on the method by which the field has been developed, the well spacing, taking everything into consideration, that is correct.

Q. Do you expect the figures to extend beyond the 21st trillion? A. No.

Q. Is that why you quit?

A. Well, I might have been able to quit one earlier and, from the standpoint of our company, I think I could probably have quit two earlier.

Q. You mean t-o-o?

A. I mean, t-w-o, because I think there will be considerable gas taken from the Panhandle Field after the time that we cease to produce gas from that field.

Q. Well, we will come back to this chart a little later, but I understand that this chart shows the rate of production per pound of drop in rock pressure decline; or, stated conversely, the rate of drop of rock pressure per trillion cubic feet produced in the Panhandle Field?

A. That is hardly correct, yet. It is the rate of drop [fol. 5031] at various stages of total withdrawal through the field.

Q. At any rate, you utilized, for purposes of your study in Exhibit 42 and Exhibit 43, the rates of rock pressure decline and production reflected in your chart, Exhibit No. 135, did you not?

A. Yes, I believe that is right.

Q. And was it by the application of those rates that you secured the rock pressure readings or estimates as shown in Exhibit 134, in Columns 7, 10 and 13?

A. Yes, sir, and so produced on Exhibit No. 133 with each curve identified by the letters "A", "B" and "C", which are, likewise, shown on Exhibit No. 134 in Columns 7, 10 and 13.

Q. Well, I wanted to make certain that I was correct in understanding that when you wanted to determine the figure to use for the rock pressure reading in 1942, let us say, as shown in Column 7, of 291.26 pounds, you first determined how much gas was going to be withdrawn in that year, and then you applied the rate of drop per unit of production to the rock pressure of the preceding year, in order to secure the reading for 1942, and you used Exhibit No. 135 for that purpose. Is that right?

A. That is correct. When I found that there was a constant in the acceleration, then it became apparent that this could be applied to the remaining years of the field [fol. 5032] and the rate of withdrawal and the total withdrawal would govern the weighted average pressure.

Again, when I speak of weighted, I am referring to only the horizontal weighting of the field.

Q. Now, Mr. Hinton, in order that we may better understand your Exhibit No. 134, what result would you have obtained in Columns 7, 10 and 13, if you had used a constant rate of drop per trillion cubic feet withdrawn?

A. I would have obtained a result which would have had a high percentage of error in it.

Q. Mr. Hinton, I am asking what the mathematical effect would be upon the figures shown in those columns.

A. That would be all in accordance with what number of pounds was used per trillion. If you would use one pound per trillion, of course the drop would be very slight. If you used 50 pounds per trillion, why, then it would show a comparatively short life for the field.

You see that you would have to know what to apply before it would be possible to arrive at any answer at all that would be worth consideration.

Q. Let me put what I had in mind this way, Mr. Hinton:

Looking at Column 7 of Exhibit 134, you have in 1949 a rock pressure reading of 314.10 pounds, whereas in 1959, you have a rock pressure reading of 18.31 pounds, estimated.

Now, if you had used a constant rate of drop, the effect [fol. 5033] would have been to give you a much larger remaining rock pressure at 1959, would it not?

A. I want to make one calculation before I answer that, please. In answering your question just asked, I would say that this calculation indicates that if you would have taken a drop of 15.57 pounds per trillion, that we would have ended at the same point on the curve, except the curve would have been a straight line, instead of a curve parabola.

Mr. Littman: Will you read the answer, please?

(Whereupon, the last answer was read by the porter.)

By Mr. Littman:

Q. Which point are you talking about, and which curve are you talking about?

A. I am talking about the Exhibit 133. The time element is the point considered, which would be the same year for each of the Curves "A", "B" and "C".

Q. And, of course, if 10 pounds were used instead of 15, that you just mentioned, Columns 7, 10 and 13 would have extended beyond 1960, would they not?

A. Yes; or if we would use 5, it would extend twice as long as that, but we know now that it takes more than 10 pounds to produce a trillion, because we have already passed that point in the rate of pressure decline per trillion feet produced.

Even now, with the feeding in of the marginal acreage, [fol. 5034] and the fact that the area of thin pay in this weighted average carries the same value as the areas of much thicker pay, we have already arrived at a point where it takes more than 10 pounds.

Of course, we know that 10 pounds would not get the right answer.

Q. We will discuss those matters a little further later.

At this stage, I was endeavoring to ascertain if we understood the various methods and assumptions which would have an effect upon the answer.

A. If there is any other question that isn't clear, I would appreciate your asking it, because I would like for everybody to understand this.

Q. All right.

Now, did you develop a formula from Exhibit 135, from which you could compute the production per pound drop in rock pressure decline through the years, or did you work directly from the chart, Exhibit 135?

A. No, I did neither. I arrived at a constant, and I applied the constant all the way through. There is no formula involved.

Q. What was the constant?

A. I believe it was 1.141.

Q. What do you mean by that?

A. I mean that for each additional trillion, that the [fol. 5035] number of pounds of pressure decline required was increased at the rate of 1.41 pounds per trillion.

Q. Beginning at what point?

A. That is based from 1935 on, that being the first time in the history of the field that there is data of sufficient accuracy to rely upon.

Q. Well, now, am I correct in understanding that there are two factors, as shown by Exhibit 134, which hasten the end of the life of the field, namely, the estimated annual withdrawals shown in Columns 5, 8 and 11, and the estimated drop in rock pressure shown in Columns 7, 10 and 13?

In other words, am I correct in stating that the greater the amount of annual withdrawals each year, the sooner you will arrive at the end-point of life of the field?

A. That is an indisputable law.

Q. And the faster your decline in rock pressure, the faster, of course, you will reach the end of the life of the field, too?

A. That is correct, but the rate of decline in rock pressure in this particular field is not entirely dependent upon the annual rate of withdrawal.

Q. What is it dependent upon?

A. The acceleration of the rock pressure decline in the field is due to several things.

I think the principle one is that, when working with the [fol. 5036] weighting of this field, that the fourth dimension is left out.

Q. What is that fourth dimension?

A. The length and breadth of the field are taken into consideration, and the pressure is taken into consideration, but no consideration is given to the depth of the reservoir.

Therefore, the weighting of the field, using the data and the factors that are used, would be a great deal like trying to tell how many thousands of gallons of water were in a lake, without knowing how deep it is.

Q. And that is what you mean by the fourth dimension?

A. That is right. You have to have length, breadth, thickness and pressure in the computation of the amount of gas in a reservoir.

Q. Now, without going into detail at this time, am I correct in understanding that the solid line shown in Exhibit 135, and which represents a comparatively short section of the entire line, was plotted from five points? Is that correct?

A. That is correct.

Q. And each point represents a year, does it not?

A. No, there are two years between the last two points or between 1938 and 1940.

Q. Now, will you refer to Page 10 of Exhibit 42, and, without going into detail at this time, will you state whether or not the five points from which you plotted the solid line in Exhibit 135 were taken from the data shown in the table [fol. 5037] on that page?

A. The pressure, as I have testified yesterday, is taken from the data of the records of the Railroad Commission of Texas, and it has been so long since I have worked on this that I would have to go back and see whether this is just exactly the take, or whether there is an amount in there that is added for lease use.

* * * * * * * * *

Q. Mr. Hinton, I believe you were going to check some figures during the recess, and tell us how you arrived at the

five points from which you drew the solid line in the chart, designated for identification as Exhibit No. 135.

A. That is right. On Page 10 of Exhibit 42, at the lower part of the page, is a table showing the amount of gas which was withdrawn from the reservoir of the Panhandle Field of Texas for periods of time shown under the first column, the amount of production in M.c.f. under the second, the pressure loss in pounds under the third, and the production per pound loss in M.c.f. under the fourth, [fol. 5038] showing in the fifth column what the indicated content of the field is at various stages, and how the application of anyone of those pressure-loss pounds could obtain an indicated reserve which would be erroneous.

Mr. Culton: By that you mean that no two of them would be the same?

The Witness: That is right.

By Mr. Littman:

Q. Now, the method used there was merely to divide the pressure loss in pounds into the production for that period? You mean to divide the pressure-loss in pounds by the production per M.c.f., do you not?

A. Into it, yes.

Q. Well, now, which do you mean, Mr. Hinton?

A. To give the production per pound loss, you divide the pressure loss in pounds into the production to arrive at the production per pound.

Q. Mr. Hinton, it is my understanding that the division is the other way around.

Will you read the last answer back, please? Maybe I misunderstood.

(Whereupon, the last answer was read by the reporter.)

By Mr. Littman:

Q. I see. I am sorry.

A. Does that answer your question all right, Mr. Littman?

[fol. 5039] Q. Well, that doesn't give you the points from which you plotted your line in Exhibit 135, does it, Mr. Hinton?

A. Yes, it does.

Q. Well, suppose you tell us how you arrived at one of the five points by that method.

A. All right.

By dividing 67.49 into 5,197,693,413, the amount of pressure decline per trillion feet was obtained and that point was plotted on Exhibit No. 135 at a point above the horizontal scale or caption, at a point where the total withdrawal had been 5,197,693,413 M.c.f. and, thus, the first point was obtained.

Now, in order to find out what the rate of decline was per trillion, we found the total withdrawal had been that from the beginning of the field to 8-1-35, plus from 8-1-35 to 7-1-36.

Then that rate was plotted on said Exhibit 135.

Do you understand that?

Q. I think I understand what you are saying.

A. I think maybe where you are slightly misled is that the pressure loss in pounds shown here stands for the fractional part of a trillion feet produced.

In other words, that 7.51 actually stands for a withdrawal of 556 billion cubic feet; and for a trillion cubic feet that would be increased by 444 billion.

[fol. 5040] Q. Suppose you make the actual division of those figures on your calculator, Mr. Hinton, and tell us what answer you get by making the calculation. Please tell us what you are doing as you go along, so that we may follow you.

A. That first calculation was merely a check to be sure that my production-per-pound loss was 74,014,270 M.c.f.

I am now placing 67.49 in the calculator. I am dividing that by 5,197,693,413. I find that the average pressure drop per trillion cubic feet at that point is, 12.98 pounds, as shown on the chart.

Q. Now, that is our understanding, and the reason we were confused is because we understood you to say that you were dividing 5,197,693,413 M.c.f. by 67.49 pounds of pressure-loss.

A. Then, I misunderstood your question, because I understood you to ask what the production-per-pound loss was.

Mr. Culton: That was correct for that, was it not?

The Witness: Yes, and that would be the answer for that.

I guess I misunderstood your question.

By Mr. Littman:

Q. Well, we are agreed now that the first point that is plotted on your chart, Exhibit 135, is 12.98 pounds.

A. Yes.

Q. Representing the average pressure-drop per billion M.c.f. withdrawn.

[fol. 5041] A. And very little consideration has been given to that point, due to the fact that the total production to that date in a large part has been estimated, and it would be well not to place too much confidence in that pressure decline up to that point.

Q. Now, your pressure decline up to—

Mr. Culton: (Interposing.) Just a minute. Did you use that in your curve?

The Witness: No, sir, it falls above the curve, and the line is not drawn through it.

Mr. Culton: All right.

By Mr. Littman:

Q. But the line is drawn very close to it?

A. Yes, it so happens that it falls very close to the line; but if it were even further away than it is, I would not place too much confidence in it, or if it fell exactly on the line, I would not place too much confidence in it.

Q. Why?

A. Because the history of the withdrawal is incomplete up to that date.

Q. That is from the beginning of drilling in the field to August 1, 1935?

A. Yes, sir.

Mr. Wheat: Mr. Littman, I believe that you mis-spoke yourself a minute ago. Is that figure and the figure which

[fol. 5042] you will get for the succeeding years in this new column that you are preparing, not pounds of average pressure drop per trillion cubic feet? You said, "billion".

Mr. Littman: I said, "billion M.c.f."

By Mr. Littman:

Q. Well, now, will you calculate the second point from which you plotted your line on Exhibit 135?

A. Yes.

Q. And tell us how you are arriving at it?

A. I am placing 7.51 on the calculator, dividing by 556,485,654, obtaining an answer of 13.495, and I am calling it 13½ pounds.

Q. Where did you put that point in your chart, Exhibit No. 135?

A. I placed that 13½ at a point on the chart where the total withdrawal had been, in round numbers, 5 trillion 700 billion.

Q. Now, is that the point that appears somewhat indistinctly on the chart opposite the year 1936?

A. That is correct.

Q. And the previous point to which you referred is designated "1935"?

A. That is right.

Q. Now, what point did you use for 1937?

I assume that the third point, designated on the chart [fol. 5043] as 1937, was computed in the same way from the third row of figures, shown on Page 10 of Exhibit 42, was it not?

A. That is right.

Q. Can you give us the exact figures?

A. Yes. I have this all worked out somewhere. It might save time to calculate it rather than look for it.

The total withdrawal for the period ending 7-1-36 to 7-1-37 was 552,281,402, which, divided into 7.95 pounds, gave an average drop of 14.39 per trillion, at such time as the total withdrawal from the field had been 6 trillion, 300 million, approximately.

Mr. Wheat: May I ask a question, Mr. Littman?

Mr Hinton, this calculation that you are making now could readily be expressed proportionately, couldn't it, by

saying that the pressure-loss in pounds is to the production in M.c.f. as X is to one trillion?

The Witness: I see no reason why that wouldn't apply.

Mr. Wheat: Giving you the figure by that particular calculation?

The Witness: Yes.

Mr. Culton: That is really what you do in the computation, isn't it, because you add certain ciphers to your answer?

The Witness: Yes.

By Mr. Littman:

Q. Now, you have arrived at the 14.39 pounds have you [fol. 5044] not, which you gave a moment ago?

A. Yes.

Q. Now, will you give the next point that you used in drawing your line?

A. The next period is from 7-1-37 to 8-1-38, and the total production was 622,925,161, which, when divided into a pressure-loss of 9.39 pounds, showed that the rate of pressure decline per trillion was 15.07 pounds when the total withdrawal had been 6 trillion 900 million plus.

Q. And that is the point which is designated in the chart, Exhibit 135, as "1938"?

A. That is correct.

Q. And that point was calculated by you from the data appearing in the table at the bottom of Page 10 of Exhibit 42, covering the 13-months' period from July 1, 1937, to August 1, 1938?

A. That is correct.

Q. I don't believe we have spoken about the previous intervals with respect to dates.

Mr. Wheat: The witness gave the dates.

The Witness: Yes.

By Mr. Littman:

Q. Did you give the dates?

A. I gave the date in each case before the amount of production was read.

[fol. 5045] Q. Now, will you give the information with respect to the fifth point on Exhibit 135?

A. That is a 24-month period extending from 8-1-38 to 8-1-40, during which time the production was 1,152,418,747 M.c.f. with a pressure decline of 19.35 pounds, and the pressure-drop per trillion at that point was 16.79 pounds per trillion, which is shown on Exhibit 135, by an indistinct circle with an arrow pointing out to a 1940 date, at which time the total withdrawal from the field had been about 8 trillion 70 billion cubic feet.

Q. And that covered a 24-months' period from August 1, 1938, to August 1, 1940?

A. Yes, sir.

Q. Now, if I correctly understand your testimony, you used the latter four points and disregarded the first of the five points?

A. That is right. That is, the one which is dated 1935 did not carry any weight in the placing of the line on this chart.

Q. And is it your testimony that if the first point had been considerably above, or considerably below, the dotted line shown, you would have disregarded it in any event?

A. That is correct, because through the history of the field, where there has been available good data, you will notice that the line passes directly through or touches each [fol. 5046] of these points, which could not be possible if there could not be a constant applied to this ever-accelerating rate of pressure decline per billion feet produced.

Q. So that in reality your line, shown on the map as a solid line, and the extension therefore, going from left to right in the dotted line form clear to the right-hand end of the chart, was all predicated upon four points developed from data covering approximately a five-year period from August 1, 1935, to August 1, 1940?

A. That is correct. If more data were available at this time for the next ten years, in all probability this line would take a higher, ascending position than as it is shown on this chart.

That is due to the fact that all gas in the Panhandle Field is saturated with moisture, and as the pressure is lowered, this moisture is dropped in the formation, and as the moisture is deposited in the channels of the field which are permeable, it is ever more difficult for the gas to pass through the formation, so during such time as pressures

are taken with a 72-hour shut-in, it will not be possible for this amount of gas to travel into the well bore and maintain the pressure.

Q. Well, the fact remains that the dotted lines, as well as the solid lines, shown in Exhibit 135, for the present and the future production, and for the past five years' pro-[fol. 5047] duction, are all predicated upon actual data covering but a five-year period?

A. That is right, estimated data for the period up to 8-1-35.

Q. Now, coming back to Exhibit No. 133, which is the pressure-trend chart for the Panhandle Field, it is a fact, is it not, that your three curves on this chart merely reflect in graphic form the data shown in Exhibit 134 in table form?

A. Yes. In addition to that, the performance curve of the Panhandle Field is also shown. It is very indistinct on here, but you will notice that the weighted average pressure of the Railroad Commission data is shown, and I call your attention to the fact that, with the exception of the year 1939, it follows this line of pressure-trend very closely.

Q. Lines "A", "B" and "C" on chart, Exhibit 133, reflect Conditions "A", "B" and "C" which are shown in Exhibit 134, do they not?

A. That is correct.

Q. And it shows that, under Condition "A", the Panhandle Field will have reached 50 pounds of rock pressure in 1958?

A. Yes, that will be 50 pounds well head pressure, and not 50 pounds formation pressure.

Q. That is the same data that is shown in Exhibit No. 134, is it not?

[fol. 5048] A. Yes, sir. I merely mention that to be sure that we were referring to the proper point of pressure observation.

Q. And the same is true of Lines "B" and "C" on chart, Exhibit 133 for identification?

A That is right. It is merely the data from Exhibit 134, plotted over in graphic form on Exhibit 133.

Q. Well, now, if you had found, from your study, that the life of the Panhandle Field was going to extend beyond 1958, your three curves, shown in Exhibit 133 for identifica-

tion, would not have sloped so abruptly, but would have fallen out further to the right, into the future years. Is that right?

A. That is right, and would have made a number of people very happy.

Q. Including yourself? A. Yes.

Q. And we may agree, may we not, that one of the factors that causes these three curves, shown in Exhibit 133, to fall so rapidly, is the rate of withdrawals from the field? Is that one? A. That is one.

Q. An another is the decelerating rate of production per pound of rock pressure decline?

A. Now, that is true, except when we speak of that decelerating or the acceleration of the pressure decline, we do not want to be confused and apply that to an equilibrium [fol. 5049] pressure.

It must be known that if we had reached an equilibrium pressure each year, and if we did know that that data was actually correct, that an equilibrium pressure had been reached, then there would be no curvature in that line, it would be a straight line because the application of Boyle's Law to that data could only produce a straight line, except for the slight deviation from the pressure there, accounted for by the fact that the gas is not a perfect gas.

Q. You are speaking of the curve shown in Exhibit 133?
A. Yes.
Q. Or the three curves shown in Exhibit 133?
A. Yes.

Mr. Culton: For clarification, you refer to the fact that that 50 pounds would be a well head pressure.

There would result a higher pressure at the sand face?

The Witness: Yes, slightly.

Mr. Culton: And it would, also, be recognition of the fact that there would be pressure gradients existing all over the reservoir?

The Witness: Yes.

Mr. Culton: From the well through the areas in between other wells?

The Witness: The curves produced on Exhibit 133 are [fol. 5050] based on the same type of weighted average pressures as we have referred to heretofore, and they are the ones that do not take into consideration the vertical thickness of pay.

By Mr. Littman:

Q. Now, I have endeavored, Mr. Hinton, to take you through your method, step by step, of arriving at the three curves shown in Exhibit 133.

Now, if I have omitted any steps up to this point whereby you arrived at the curves, I would like to have you give any further explanation, as you may wish to make certain that we have covered the major steps, at least.

A. I believe that it has been pretty well covered.

There is one thing, if I might, I would like to call your attention to, at this time.

Q. Very well.

A. And that is the fact that this year is the first year that actual potential or open flow tests have not been made and the potentials were obtained on back pressure open flow curves of tests made in 1940, and the decline in open flow is wholly dependent upon decline in the well head pressure.

Therefore, everyone, in an effort to keep their open flow or potential as high as possible, has closed their wells in for as long a period as possible before those pressure readings were taken.

I am of the belief that we are going to get a rock [fol. 5051] pressure on the entire field this year that will be somewhat higher than it would have been if tests would have been taken in the same manner as in previous years.

Mr. Wheat: When you say "this year", you mean in July, 1941?

The Witness: July, 1941.

Mr. Culton: In other words, tests this year were not made under the same conditions as tests in previous years?

The Witness: Yes. I just mention that, but, of course, that will right itself down through the years, because when

the back pressure open flows are taken in the future, why, in all probability the Railroad Commission will require that the shut-in pressure at the well head will be taken after the back pressure test has been taken, which means that there will have been a sizeable amount of gas produced before the well was closed in.

That pressure will be taken, probably, between 72 hours and 96 hours after the completion of the test.

By Mr. Littman:

Q. In other words, you are fearful that the next report of the Texas Railroad Commission will not bear out your rock pressure drop?

A. Not fearful, hopeful that it will not; but I just mention that it is not a comparative test with previous years.

Q. In other words, by "hopeful", you mean that you [fol. 5052] would be glad to learn that the life of the Panhandle Field would be in excess of the 15 years that you estimate?

A. Yes, sir, unless they lowered our retirement age.

* * * * * * * * * *

Q. Now, the next step, as I understand it, was that you prepared certain pressure trend charts for your operating areas, "A" to "G", inclusive? Is that correct?

A. Yes, sir, that is correct.

Mr. Littman: I would like to have marked for identification as Exhibit No. 136-(1) a chart entitled, "Panhandle Eastern Pipe Line Company Wells, Pressure Trends Group Area 'A'."

Trial Examiner: This chart may be so marked for identification.

(Exhibit No. 136-(1) Was Marked For Identification.)

Mr. Littman: I would, also, like to have marked for identification as Exhibits Nos. 136-(2) to 136-(10), inclusive, certain other charts of similar character and description as that which I read for Areas "A", "B", "C", "D", "E", "F" and "G".

Trial Examiner: Very well. We will mark the series for identification as Exhibit 136 with the sub-numbers, in parentheses, 1 to 10, both inclusive.

(Exhibits Nos. 136-(2) to 136-(10), Inclusive, Were Marked For Identification.)

[fol. 5053] By Mr. Littman:

Q. Are the charts, which have been marked for identification as Exhibits Nos. 136-(1) to 136-(10), inclusive, the pressure-trend charts for Areas "A" to "G", inclusive, to which you just referred?

A. With the exception of No. 5, which is a duplicate of Area "C", and it rightfully could be included. Yes, they are my idea of what the pressure will be, by years, as an average in each of the group areas in which we operate.

Q. Did you use all of these charts in arriving at your estimate of production in the Panhandle Field, which is shown in Exhibit 131 and, also, in Schedule 5 of Exhibit 43?

A. I used them as a basis for my estimate, and did not stick to them entirely, mathematically, because I went to round numbers and I also used some degree of judgment, based on experience, and did not show, as it was not possible to show, that there would be necessary additional horsepower required at certain times to maintain the level of production shown in Exhibit 131, as there were no capital expenditures shown after the 1946 year.

Mr. Littman: Will you please read back that answer?

(Whereupon, the last answer was read by the reporter.)

By Mr. Littman:

Q. You stated a few moments ago that Exhibit 136-(5) was an exception of some sort. Will you please amplify [fol. 5054] that statement?

A. Yes. It is all right. I saw this "revised" on here, and I thought it meant that the revised copy had been put in, in addition to the copy of the original, which was an error.

There was an error on the Group Area "D", due to the fact that a draftsman put "C" instead of "D" on it. I sent a replacement, and I thought you had not taken the originals out, so they are all right as is.

Q. And there are no exceptions? A. No.

I would like to call your attention to the fact that for Areas "A", "B", and "C", there are two pressure-trend

charts, one for the company wells and one for the purchase wells, but there are no purchase-well pressure trends for Areas "D", "E", "F" and "G".

That is due to the fact that "D", "E", "F" and "G" are areas of high permeability, and it is assumed that the pressure on the purchase wells will be the same as that on the company wells in these three highly permeable areas.

Q. Suppose we look at Exhibit 136-(1) for a moment.

Now, this exhibit, which is a chart, shows the pressure trends for the company wells in Group Area "A", which area is shown in your Exhibit 46. Is that correct?

A. Yes, sir, that is correct.

[fol. 5055] Q. Now, am I correct in understanding that each of the lines drawn on the chart prior to 1941 represents an individual well? A. That is correct.

Q. Now, will you explain what those lines mean?

A. Those lines stand for the observed well head pressure at those wells during the midyear tests for each year, commencing in 1931 and ending in 1941.

Q. You are now referring to tests made by the company on its own wells?

A. Up to the 1935 test, and during that year all tests were made under the supervision of the Railroad Commission of Texas and have been, from that time to date.

Q. And those tests were made along about the middle of each year? A. Yes, sir.

Q. In other words, you plotted a point in each year for each test on each well, and then drew a line for each well?

A. Yes, sir, from pressure point to pressure point.

Q. Now, I note that some of these lines are rather inconsistent, in that they go down and then up and then down again from year to year, and look a little bit zig-zag.

Will you please explain that?

A. That curve in the year 1937, the only reason that I could advance for that extreme dip in pressure on the two [fol. 5056] wells which are shown, is the fact that the wells had not been closed in before the tests were taken and were probably producing on the line, and instead of waiting until there had been a 72-hour shut-in pressure, that the pressures were recorded immediately after the wells were taken off the line.

Q. Now, for those wells to which you have just pointed, the rock pressure in reading in 1938 was considerably higher than in 1937?

A. That is right. It would indicate that the pressure was observed immediately after they had been produced on the line, and that they were closed-in a normal length of time in 1938.

Mr. Culton: Do you recall which those two wells are?

The Witness: I was trying to make out the number, but it is so dim on here that I am unable to do so, but I can tell which two wells they were by looking at my pressure data, if you want me to.

By Mr. Littman:

Q. Well, I wasn't particularly interested in any two wells, Mr. Hinton.

A. There are two of the Burnett wells.

Q. Well, how long are these wells ordinarily shut-in before the rock pressure readings are taken?

A. The requirements in the Panhandle Field are now a minimum of 72 hours, with no maximum shut-in time. [fol. 5057] For the Hugoton Field, I took it upon myself this year to write the rules for testing, because I was Chairman of a Subcommittee on some tests being made in the fields, and they were accepted by some other producers.

We have a minimum of 72 hours in that field, and a maximum of 96, which gives us a 24-hour period to take pressures after they have been producing on the line at a normal rate for not less than six days previous to being shut-in.

Q. Now, what are the vertical calibrations on these charts?

A. They are merely the observed closed-in pressures of the wells, and are in pounds per square [in,] gage pressure.

Q. Now, the lines prior to 1941 that are shown in each of these charts in Exhibits 136-(1) to (10), inclusive, represent actual rock pressure readings, do they not?

A. Yes, sir.

Q. And what do the lines shown on and after 1941 represent?

A. That is my idea of what the probable average closed-in well head pressure will be for the wells located in Group Area "A".

Q. In other words, that line represents your estimate of the average for all wells? A. That is correct.

Q. In that area? Is that right?

[fol. 5058] A. Yes, sir.

Q. Now, in each of these charts you have a single line running on and after 1941, and I believe you have already stated that that represents the average of all of the individual wells in that area?

A. It is an estimate of what the average pressure to be expected is.

Q. In other words, by looking at the chart, Exhibit No. 136-(1), for instance, in the year 1952, for example, you merely ascertain the point at which the estimated line crosses that year, and you take the reading shown on the chart by vertical calibrations, and that gives you the rock pressure which you will expect to be found in the area at that time?

A. That is correct.

Q. And what is the average on this particular chart?

A. 174.5 pounds.

Q. For 1952? A. Yes.

Q. Now, how did you draw this extrapolated line in Exhibit 136-(1), for instance, which covers the years from 1941 down through 1958?

A. You mean by "how did I draw it", what things did I give consideration to in the placing of this line upon the chart?

Q. I would like to have the steps used by you in plot-

[fol. 5059] ting it.

First, Mr. Hinton, you might tell us why you started at the particular point that you did, which appears to be at 340 pounds rock pressure.

A. That happened to be the approximate average of the wells in that area at the midyear pressure observation for the year 1941.

In placing this estimated pressure-trend upon this chart, I first found out what was happening in the field by going back through the steps which we have gone through on Exhibits 133 and 135.

Q. Exhibit 133 reflects the data shown in Exhibit 135, does it not? A. Yes, that is right.

Q. So that, if you looked at Exhibit 133, that would give you the information that you desire? A. Yes.

Then, I made myself acquainted, as nearly as possible, with the type of wells which are prevalent in Group Area "A". I then made myself acquainted with the rate of withdrawal from that group area.

I next found out, as nearly as possible, how many remaining well locations there were in the group, and the next thing I did was to find out what the—not find out, because I knew, but I studied more closely the pressure [fol. 5060] condition in that area, and in the areas surrounding it.

By combining all of this information with the build-up pressure records of that area and the pull-down pressure records, I placed this pressure-trend decline curve upon the chart.

* * * * * * * *

[fol. 5063] C. H. HINTON, a witness, having been previously duly sworn, resumed the stand and testified further as follows:

Cross-Examination (Continued).

By Mr. Littman:

Q. At the close of yesterday's session, we were discussing the pressure-trend charts designated for identification as Exhibits Nos. 136-(1) to 136-(10), inclusive.

Trial Examiner: Do you have the pending question in mind, Mr. Hinton?

The Witness: No, sir.

Trial Examiner: There was an unanswered question.

By Mr. Littman:

Q. At the close of yesterday's hearing, I asked you to explain, step by step, the method used by you in drawing the curve on each of these charts which is projected beyond the 1940 and from the year 1941.

A. I believe that we have gone through the method used in placing the pressure line, the individual pressure line for each well from the date the well was drilled to the [fol. 5064] midyear test for 1941.

Now then, as to the matter of extending the pressure-trend curve on each group, there were many things that were taken into consideration.

The basic and perhaps the main thing, is the field performance, that is, of the total field. The past performance of the field has been extended as shown on Exhibit 133.

Q. May I interrupt to ask you whether you mean that you used the same general curve as that which is shown on Exhibit 133?

A. Not exactly the same curve, no, but the curve shown on Exhibit No. 133 is the controlling factor for the placing of the pressure curve of each of the group areas because, as the whole field goes, to a certain extent so must each group area follow.

In addition, it was necessary to weight carefully the amount of gas that is being withdrawn from each group area to take the formation into consideration from the standpoint of how fast it is indicated that gas flows through the formation in each of the group areas, and also what the probable effect of the withdrawal will be from areas adjoining each group area.

For example, in Group Area "A", you will note that the pressure line on Group Area "A" extends to about the middle of 1958.

Now, in placing that pressure line at that point, it was [fol. 5065] necessary to know that the general characteristic of the formation in Group Area "A" is what would be termed "tight" in comparison to the formation over in the Moore County area of the field.

Mr. Culton: Moore County would be, for instance, "E", "F" and "G"?

The Witness: Yes, principally "F" and "G".

Now, in the studying of the action of the gas through the formation and the flow, it was necessary to carry on

a long series of observations to determine just how long it takes to build up the pressure once a well has been blown to atmosphere, and we find that in Group Area "A", the length of time required for a well to regain its normal closed-in pressure is considerably longer than it is over in the Areas "F" and "G" and "E" and the west part of "B".

Therefore, there was consideration given to the things mentioned before the pressure line was extended, and it is not based on any pure mathematical calculation.

Trial Examiner: Mr. Hinton, in Group Area "A", you have embraced a part of the sour gas field, I believe?

The Witness: Just a little bit there to the northeast, because that actually governs the rate of withdrawal for the area northeast of our development.

Trial Examiner: The sour gas, I understand, is withdrawn without control.

[fol. 5066] The Witness: Sour gas is prorated, but the amount that is withdrawn, as a whole, is not controlled. It merely means that the total amount is divided between the wells which have been drilled in the sour gas area.

Mr. Culton: What the Examiner is getting at, I think, Mr. Hinton, is that the production from those sour gas wells is not limited to the volume of production that is actually taken ordinarily from the nearby sweet gas wells.

The Witness: That is correct.

Mr. Culton: They are limited in their production, but not to the small volumes that are really being taken from the sweet gas, is that right?

The Witness: That is right.

However, the rate of withdrawal from the wells located in the northeast part of Group Area "A" are not producing at the rate that the sour gas wells are producing in the northern part of Moore County.

Trial Examiner: That was the information I was about to ask, having noted that the sour gas area in your Group "A" is rather near the Town of Borger and quite close

to an extensive petroleum development, and I was about [the] ask whether or not they had carbon black plants in the Borger territory which were drawing heavily from this corner of your Group "A".

The Witness: There are several large carbon black plants at Borger, but they are not supplied entirely by [fol. 5067] the production in that area, because some of that gas is piped in from other portions of the sour gas area of the field.

Trial Examiner: The pressure map does show a pressure zone in the extreme northeast corner of your Group "A" running as low as 150 pounds.

The Witness: That is correct, sir, and if the formation in Group Area "A" had the same characteristic as the formation in "G" and "F", the estimated life of the Group Area "A" that would be placed upon it by me would be much shorter than it is.

Trial Examiner: You refer now to some difference in the permeability, or the ability of the gas to migrate in that area?

The Witness: Yes, permeability is the major factor.

However, I believe that the average total pay thickness in the Moore County section of the field, "E", "F" and "G", will average a greater thickness than the pay thickness in Group Area "A", but permeability is the controlling factor.

Trial Examiner: And that is greater than in some of the other areas?

The Witness: Yes, sir.

By Mr. Littman:

Q. Mr. Hinton, the curve that we have been discussing, which appears on each of the charts, Exhibit 136-(1) to Exhibit 136-(10), which we will hereafter refer to as the [fol. 5068] pressure trend charts, is a very important curve and was used by you directly for the purpose of estimating the amount of gas that will be withdrawn from the wells owned and controlled by Panhandle Eastern, is that right?

A. Yes, the pressure is the governing factor for the life of the fields for long-distance pipe lines.

Q. And you used these curves on the pressure-trend charts literally in determining the expected rock pressure in the future years, is that correct?

A. Yes, sir, that is correct.

Q. Now, do I understand [you] testimony to be that this important curve drawn on each of these pressure trends was not drawn from any mathematical formula?

A. That is correct.

Q. It is purely a judgment line?

A. A judgment that is weighted by every factor which should enter into the pressure-trend of each group area as nearly as it is possible for me to place that in the proper weight upon the curve.

Q. You stated a moment ago you gave great weight, in drawing these curves on the pressure-trend charts, to the curves appearing in Exhibit 133 which are designated as Curves "A", "B" and "C"?

A. That is correct.

Q. As a matter of fact, those curves very closely re- [fol. 5069] semble each other, do they not?

A. Yes, they do.

Q. The curves shown in each of the pressure-trend charts?

A. That is right. We might say that that is the father and these are the children of the curve shown on 133.

Q. By "that is the father", you mean the curves shown in Exhibit 133 and the children you refer to as Exhibits 136-(1) to 136-(10), is that right?

A. That is right. In other words, as the average for the entire field goes, so will every portion of that field follow the average to a large extent.

Only the things which I have talked about will govern, in my opinion, how the trend will differ in each of the areas from the average of the total field.

Q. Well, do I understand that if you had applied the curves appearing on Exhibit No. 133 literally to each of the pressure-trend charts, Exhibits 136-(1) to 136-(10), you would have obtained, substantially, the same result as that obtained by using the curves which you did use on the latter charts?

A. No, there would have been quite a little difference there because, if I would have used the curve on Exhibit No. 133 without giving consideration to the other things, each group area would have been identical, and the purpose of laying out the group areas would have become useless because, if we were going to use the one curve, [fol. 5070] it would not make a great deal of difference if we were just going to apply the average of the field to this problem, rather than giving consideration to what is believed will actually happen in each of the group areas.

Q. Well, your starting point of the curve in 1941 would have been different for each of the areas, would it not?

A. Yes, that is correct. The arithmetical average of each of the group areas would have been different.

Q. Well, looking at Group Area "A", Exhibit No. 136-(1), will you point out how far you deviated from the curve used in Exhibit 133?

A. I have already said that I believe that the curve "C" on Exhibit 133 is based on withdrawal figures that are more likely to happen than the other two, "A" or "B".

Q. Now, "C" refers to Condition "C", sometime Condition 1, which reflects the increased production in the Panhandle Field by all operators therein?

A. No, sir, that is Condition No. 3, and is Lines 11, 12 and 13 on Exhibit 134.

Q. I thought that you testified that Condition "C" and Condition 3 were the same?

A. Yes, but you said Condition 1. I was referring to "C".

Q. I am sorry, I meant that Condition 3 and Condition [fol. 5071] C are synonymous. A. That is correct.

Q. And what is the Condition to which you refer when you use the letter "C"?

A. Do you mean that you want me to tell you what is going to happen under that Condition, or just merely identify it on the exhibit?

Q. Well, I mean to repeat what it means, generally.

A. Condition "C" gives consideration to an increased withdrawal by pipe line companies from the Panhandle Field, not only Panhandle Eastern's, but other major pipe lines taking gas from that field.

Q. And the line designated by the letter "C" on chart, Exhibit No. 133, reflects that condition, does it not?

A. Yes.

Q. Now, will you proceed?

A. The average for the field in 1941, as shown in this graph, is 314 pounds, approximately.

Mr. Culton: 314.10 is what Exhibit 134 shows, is that approximately right?

The Witness: Yes.

Now, if this same line would have been extended from the average of Group Area "A" at the point where the pressure was extended from 1941, there would have been a difference of 28 pounds, and if the same curve would have been placed upon Group Area "A" as the curve [fol. 5072] for "C", the length of life would have been extended beyond the point which is shown on Group Area "A".

By Mr. Littman:

Q. In other words, you would have had—

A. (Interposing) In other words, instead of coming down to 50 pounds well head pressure at approximately midyear, 1958, that would probably have run out in 1960, but now then, if I might show you, I will try to explain why I do not think that that will happen.

You will notice that in the—

Mr. Culton: (Interposing) You are now pointing on Exhibit 26, the rock pressure map?

The Witness: Yes, sir.

Mr. Culton: All right.

The Witness: Now, you will notice that group areas have been superimposed upon this rock pressure map.

Mr. Culton: That is on the Examiner's copy that you are pointing to?

The Witness: Yes, sir, in red pencil; and in the northeastern corner of Group Area "A", you will note that there is an area between 200 and 150 pounds.

Naturally, the gas which is now in place in the portion of Group "A" in which we operate is going to flow to the [fol. 5073] area of lower pressure.

The type of market for which the gas is used to the northeast of Group Area "A" means that this pressure will continue to be pulled down lower than it is.

Therefore, there is going to be a migration of gas out of Group Area "A", just as there will be in any area where there is an area of low pressure adjoining the group area.

In addition to the rate of withdrawal per acre from Group Area "A", consideration has been given to this portion (indicating).

By Mr. Littman:

Q. And how much consideration, and how did you arrive at that amount?

A. The amount of consideration which has been given to the conditions mentioned is reflected on Exhibit 136-(1), and it would not be possible for me to say as to what percent or any certain amount that has been placed upon that.

I have just placed that upon there to the best of my ability, feeling that I have given proper consideration to the things which are involved in determining the future pressure of these group areas.

Q. In each of the Areas, did you shorten the life as you did in Group Area "A" from that which is indicated by the Curve "C" on Exhibit 133? A. No.

Turning over to the pressure-trend curve for Group [fol. 5074] Area "B" you will notice that the estimated time that the pressure will decline at the well head to 50 pounds is about midyear, 1960.

Q. Well, Mr. Hinton, isn't that clearly the result of your starting point in 1940, rather than the result of a difference in the curvature of the curve?

A. It absolutely is not.

Q. Looking at your curve in Exhibit No. 136-(3), for Group Area "B"; it certainly appears by eye to be even

a sharper curve and a more sharply ascending curve than that shown in Exhibit No. 133. Am I right?

A. Yes, it is a more sharply ascending curve, because the line to the west of Group Area "B", you will notice—I am sorry, I cannot point it out to you—but Canadian River Gas Company has large holdings of acreage—

Mr. Culton: (Interposing) Can you point out the general location of that acreage on one of the maps?

The Witness: It might be termed as the extreme southern portion of Moore County and the Northern part of Potter County down to the fault line, south fault line.

Now, Canadian River has this tremendous undeveloped portion of acreage and whereas it is shown to have pressure above 400 pounds at this time, it is going to be surprising what will happen when that Canadian River acreage is drilled, because all through the years, as this gas has been taken out, each time that the pressure in the developed portion of the field has been lowered one [fol. 5075] pound or any number of pounds, there has been a migration of this gas and there is a pressure gradient from this undeveloped acreage over to the developed acreage.

Now, just as soon as Canadian River is forced to go in there and develop that acreage, there is going to be one of the sharpest pressure declines that has ever been experienced in that field, and as soon as that pressure goes down, then this pressure which is holding up the pressure in our area "B" at the present time is going to be lowered.

We will no longer receive benefit from migratory gas from the west, and there will be a sharp pressure decline.

Trial Examiner: Before you leave that, would you like to refer to Mr. Smith's cross-section, Exhibit 22, in that connection?

Mr. Littman: No, I would not, if your Honor please.

I understand the testimony to be that that cross-section was not an actual cross-section but—

The Witness: (Interposing) It shows the picture all right, however.

Mr. Littman: That is a little bit beside—

Mr. Culton: (Interposing) I do not think the statement is exactly accurate. It was that the wells are not actual wells, that the wells are only typical wells.

The cross-section, he stated, was correct.

Mr. Littman: My recollection of the testimony is very [fol. 5076] distinct, that that was not an actual cross-section, but was purely a typical cross-section.

Mr. Culton: You are mistaken on that. It was the wells that were typical. He specifically pointed out on the map where that cross-section went.

Mr. Littman: Of course, the record will speak for itself, but at this time I would like to interrogate Mr. Hinton about this curve, and if he wishes to go into further details and data, you can do it on redirect examination.

Mr. Culton: We will do it on redirect examination.

Mr. Littman: And I think that we will save time.

By Mr. Littman:

Q. Now, Mr. Hinton, if my eyes do not deceive me, certainly the curve—now, I am speaking of the curve in Exhibit 136-(3)—is not substantially different from the curve shown in Exhibit 133.

If anything, the curve in Exhibit 136-(3) descends more sharply than that shown in Exhibit No. 133. Am I correct?

A. You are correct, and for the reason just explained.

Q. Now, you start in Exhibit No. 136-(3) in the year 1940, you start your curve at approximately 375 pounds of rock pressure, do you not?

A. About 378.

Q. Yes, whereas the curve in Exhibit No. 133 starts in that year at about what point?

[fol. 5077] A. 308.6 pounds.

Q. And doesn't that account for your having an end point in the year 1960, approximately, of 50 pounds rock pressure in Exhibit 136-(3), as compared with an end point in approximately the year 1956 or 1957 for your curve "C" in Exhibit No. 133?

A. Naturally, the starting pressure governs the ending pressure, but if the same curvature were to be placed upon 136-(3) as is shown on Exhibit 133 by Curve "C", it would extend far beyond 1960.

Q. Well, then, I understand that in this instance, namely, Group Area "B", the effect of your changing and deviating from the line drawn, or curve drawn, in Exhibit No. 133 has the effect of shortening the indicated life, is that right?

A. Of the group area.

Q. Of the groups in Group Area "B".

Mr. Culton: Shortening from what?

Mr. Littman: Well, bringing about a decline to 50 pounds rock pressure sooner than you would have secured it had you used the curve shown in Exhibit No. 133.

The Witness: That is absolutely right, but it would not be placed in the right manner if that would be followed.

By Mr. Littman:

Q. I do not understand that.

A. All right. Suppose that we placed—take the curve shown, Curve "C" on Exhibit 133, and place it right under [fol. 5078] the Exhibit No. 136-(3) and then extend the same curve on Exhibit 136-(3) as shown by Curve "C" on Exhibit 133.

We would end up by having an area out here (indicating) to itself that would be many pounds higher than the average of the field, and regardless of what we would like, it is impossible for any operator to hold the amount of gas which was in place under any lease and the amount of gas that is actually to be taken is governed by the withdrawal of the whole field.

Therefore, it would be impossible to take this area in this high-pressure area and have it standing out there all by itself with low pressure all around it because, as the pressure is lowered in the area surrounding Group Area "B", then the pressure in Group Area "B" is going to come down sharply.

Q. Perhaps we can get at your method this way. You have already testified that the curve "C" shown in Exhibit

No. 133 was the controlling factor in your method of arriving at the curve to be used on the pressure-trend chart, is that right?

A. That is correct.

Q. Now, your deviations from the Curve "C" to which you have just referred, were not very substantial, were they, one way or another?

A. I would say that there was considerable deviation, because if we turn through the Exhibits, from Exhibit [fol. 5079] 136-(1) to (10), we will find that we have a variation.

You will note that on 136-(2), that the estimated length of time, or period when the well head pressure will become 50 pounds on the gas purchase wells located in Group Area "A" is 1953.

Turning to Exhibit 136-(3), you will notice that it is in 1960 that this pressure will be reached, and I would say that seven years was considerable deviation from the average.

Q. Well, was that due to the difference in the starting point of those curves, or was it due to the difference in the curvature of those curves?

A. Both.

Q. Well, now, how did you give effect to the change in the curvature of the curve? How did you arrive at anything like that? Did you do it mathematically?

A. Not only from the application of a constant, which has been established by past field performance, the deviation from the curve that was thus produced is largely a judgment figure with weight given to every controlling factor that could be thought of.

Q. But I cannot understand how you arrived at how much weight was to be given, one way or the other, to these multitudinous considerations that you say you considered.

A. Mr. Littman, I think that a gas field is a lot like law. You have to work with it a long time before you know [fol. 5080] just exactly how to proceed, and it is one of those things that you cannot just exactly lay your finger on, but it is one of those things that you know should be applied.

Q. Mr. Hinton, let me get at what I have in mind this way.

You knew where to begin to draw each of the curves in the group for each group area on each of the pressure-trend charts, did you not?

A. Yes.

Q. By taking the average rock pressure as of 1940 or 1941? A. Yes.

Q. Now, you knew where the end point was going to be, did you, that is, the bottom point of the curve?

A. Not until such time as I had studied all of these factors.

Q. You must have set the end point before you started to draw the curve, is that correct?

A. No, you do not draw a curve like that, Mr. Littman.

Q. How did you draw this curve, kind of free-hand?

A. A free-hand curve, and it is a judgment figure curve.

Q. Let's go back to the beginning point of each of these curves that you drew in the pressure-trend charts.

Now, how did you go about finding the first point through [fol. 5081] which the curve runs?

A. I added up the current well head pressures and divided by the number of wells on which the pressures were observed.

Q. And what was the next point that you selected, and how did you select it?

A. I found out what had been happening in the past and what would probably happen in the future. That is, as to the number of remaining locations that had not been drilled.

I took the total acreage in each group area and found out what number of undeveloped acres remained. I divided that by 640 acres, assuming that there would be one well drilled to each section of land, and I found out that there would be a certain number of remaining locations, and that the rate of withdrawal would probably be increased from that area.

Q. Let's take Group Area "A", which is Exhibit 136-(1).

Now, show us the first point that you plotted to draw the curve?

A. I did not plot.

Q. Well, the first point that you used or established.

A. All right. I took a triangle and I ran it up through the general trend of what had been happening on all of these wells in this group area, and I started the extension of my curve from that point.

Then keeping in mind all the time, as this marginal acre-
[fol. 5082] age is drilled, the so-called weighted average is going to come down quite sharply because as soon as the thin acreage is drilled, the pressure decline on that is going to be much more rapid than it has been on the thick pay portion of the field, and as that comes down, that is going to accelerate, tend to help to accelerate this curve, and from that point on, I kept the other things under consideration.

You will notice down here, along about 1955, '54, that I assumed that there would be a sharp decline in the total amount of gas that would be withdrawn from this area, and for that reason, the curve straightens out down at this point.

Q. Now, when you started to draw this curve, you drew it at a point indicating the average rock pressure in 1941?

A. Yes, sir.

Q. Now, what was that figure?

A. That was approximately 340 pounds.

Q. All right.

Now, in 1942, what rock pressure is indicated?

A. 329, approximately.

Q. How did you arrive at the 329?

A. By following out what had been happening through the years of a comparable withdrawal rate.

In other words, if I could have a straight-edge triangle—you will notice that that line could have taken many differ-
[fol. 5083] ent slopes, that is, it could have been flat, or it could have been very sharp.

Q. You are now referring to the lines prior to 1941, showing the past rock pressure readings of the wells?

A. Yes, for individual wells.

Q. They zig-zag in almost every direction, is that right?

A. Well, no, there is a general trend, and that trend is downward; and if you will go back to 1931, you will find that it is a much greater slope than if we go over to '40, '41, and the '40-'41 is not following the slope that was previously established by that group of wells from 1938 to 1940, and I mentioned that yesterday, that the shut-in pressure for the period observed in 1941 was of considerably greater length than the shut-in period for the previous years.

Therefore, I just used my judgment to give the curvature that I did to this curve.

Q. Now, Mr. Hinton—pardon me, had you finished your answer?

A. Yes, go ahead, I am sorry.

Q. Now, if 100 engineers looked at all of those varying and criss-crossing lines shown in Exhibit No. 155-(1), for instance, and had undertaken to do this job of drawing from those data a free-hand curve down through the chart beyond 1941, in all probability, you would have had 100 different curves, is that right?

[fol. 5084] A. And—

Q. (Interposing) Is that—

A. (Continuing)—and the value—

Q. (Interposing) Is that right?

A. Yes, that is right, and the value of the curve would have to be based upon the knowledge that engineer had of the subject.

Q. Well, 100 engineers would, in all probability, interpret the historical data of the rock pressure of these wells prior to 1941 in 100 different ways; is that right?

A. And if they did, and carried out their calculations in an accurate, normal manner, the result obtained by the 100 engineers would be very close to the same.

There would be variation, I will grant you that, but the total percent of variation would necessarily have to be small if they knew what they were talking about.

Q. Then, in the final analysis, these important curves that you applied literally for the purpose of estimating the rock pressure for each year in the future, and upon which you based and predicated the production of the Pan-

handle Eastern well in the future, was purely a matter of judgment?

A. And knowledge of the subject.

Q. And it was not based at all upon any mathematical formula?

A. No, no straight mathematical formula, a great deal [fol. 5085] of mathematics, but no formula.

Q. And these important curves appearing in each Exhibit 136-(1) to 136-(10), inclusive, from and after 1941, were plotted free-hand by you from your general knowledge and judgment?

A. Knowing—

Q. (Interposing) Is that right?

A. That is right.

Q. You see, when you nod your head, the record does not show it.

A. I will try to cut out nodding.

Q. Your answer was "yes", and you were going to explain further?

A. And I just wanted to mention that these curves are always going to be available for the management to look at and for me to receive criticism from.

Q. Now, am I correct in understanding that you did not plot any points along the field from which you drew the curve, I mean the field of the chart?

A. Your question, I believe, is, were any dots placed upon the chart that had mathematical significance?

Q. Well, either physical points, or mental points, did you plot the curve through certain points on the chart?

A. Mental points, yes, every fractional part of the way; physical, no.

[fol. 5086] Q. How did you get at the precise figure through which you drew your curve in the first instance on Group Area "A", No. 136-(1)?

A. To what precise figure do you refer?

Q. I am referring to 1942. A. 1942—

Q. (Interposing) Was that your second point?

A. That was not a point at all. It was just merely a line.

Q. Well, you say you knew your starting point.

A. Yes, sir.

Q. What was your next point, if any?

A. The curve passes through a point at midyear, 1942, which is at approximately 329 pounds' pressure.

Q. Now, if you had continued that point straight ahead, you would have had a straight line, would you not?

A. Naturally.

Q. All right. Now, how did you determine the curvature of the curve?

A. Well, I first figured the number of square miles in the group area. I obtained a knowledge of the formation by well performance. I gave consideration to the total withdrawal from the field. I gave consideration to the withdrawal from areas surrounding this particular group area.

I studied the acreage situation, found out how many re-
[fol. 5087] maining locations there were to be drilled. All of those things which I have previously mentioned were taken into consideration.

Q. Am I correct in understanding that this is not, strictly speaking, an engineering curve?

A. No, it is not.

Q. You say it is not?

A. No, if you mean by an engineering curve, does it have the same degree of curvature throughout or is it a simple or complex or a compound curve, it is not.

Q. Is it a plotted curve?

A. It is a drawn curve.

Q. But not plotted through various points arrived at by you on the chart?

A. Not physical points, no, sir.

Q. When did you reach the point at which your curve strikes the bottom of the chart? Was that the last step, or was that one of the early steps?

A. That was the last step.

Q. And you reached that point simply because the arc of your curve results in the curve falling at that point?

A. That is right, with due consideration given to the rate of withdrawal.

Mr. Culton: Let me ask a question. Is that a uniform degree in the arc?

[fol. 5088] The Witness: No.

Mr. Culton: So it really is not an arc, is it?

The Witness: Well, probably strictly and technically speaking, it is not.

By Mr. Littman:

Q. I regret, Mr. Hinton, that I am thus far unable to understand how you drew this curve. I wonder whether you would try once more and start with the beginning of the curve on Exhibit No. 136-(1), and trace, step by step, what you did and what you thought about in doing it.

A. The first step in making the curve shown on 136-(1) for Group Area "A", was to plot annual observed pressures of all wells connected to the system of the Panhandle Eastern Pipe Line, and they were plotted up through the year 1941, that being the last data obtainable.

Q. Those are the company wells only, are they not?

A. That is correct. This refers to company wells only.

I then found out that there were certain amounts of acreage held by various companies in that area.

Q. What amounts?

A. I found out that the Panhandle Eastern had 10,200 acres, approximately; that the Cities Service Gas Company had 39,800 acres; Phillips, 1,600 acres; and Canadian River, 10,550; and the rest owned by various others.

Q. How much by the various others, as a group?

[fol. 5089] A. 12,850 acres.

Q. Making a total of how many acres?

A. 75,000, approximately.

I then found out that in 1935 there had been 80 wells drilled on that group area. I found out that there had been 5 [addition] wells drilled by 1936; 10 additional wells drilled by 1937; one in 1938; one in 1939; and 2 in 1940; which indicated that the rate of development was very slow in that particular area.

It can be noted on Exhibit 136-(1) that the pressure line for Well No. 1 and No. 7 fall considerably below the average of the wells in that group area. Naturally, that caused me to give consideration to the lower pressure areas to the northeast; so, after I [find] who owns the wells and what the rate of development has been, what the rate of withdrawal is and what the field performance in that

particular portion of the field had been, it gives me a very, very good idea on how to go ahead and extend this pressure curve, knowing in the back of my mind how the pressure performance for the field, as a whole, is going to be.

Q. All right.

Now, up to that point, you have certain information.

A. Yes.

Q. Then, did you start to draw the curve? A. Yes.

[fol. 5090] Q. And you had a starting point, did you not, in 1941? A. Yes.

Q. Now, will you state that point again?

A. That is 340 pounds, approximately.

Q. 340 pounds? A. Yes.

Q. Of rock pressure which represents the average pressure of the wells in Area "A"? A. 15 wells.

Q. Now, proceed to draw the curve for us from there, and tell us how you drew it, step by step, please.

A. All right.

As I have already mentioned, the basis of the extension of the curve is past performance, and past performance weighted with an estimated future rate of withdrawal really comes right down to the point where you know then, by the next year, that the pressure decline is going to be a little bit greater than it was before and you will notice—

Q. (Interposing) How much greater?

A. Approximately 1.141, I believe, is the figure, but it is not applied—

Q. (Interposing) What is that, 1.141 pounds?

A. Yes.

[fol. 5091] Q. Per year? A. Per trillion.

Q. Per trillion? A. Yes.

Q. That is the rate of decline that you used?

A. No, that is the rate of the decline that should be added to the previous declines and that applies to the whole field.

Now, then, I believe that I have gone into sufficient detail to explain how each of these things are given consideration on the extension of this curve, and I told you two or three times that it is not a mathematical curve, and by

you asking me to go ahead and extend this curve, I again say that I applied my judgment as governed by the performance of the field as a whole.

Q. You have not told us how much weight you applied to each element you say you took into consideration, Mr. Hinton.

A. No, and I could not tell you, Mr. Littman, because it is not that kind of a curve. It is not that I put in so much salt and so much sugar. It is a combination of all those things and it varies as to each group area, or we would not have outlined the group areas on the field.

Q. You stated a while ago that you set your triangle through the past experience, is that right?

A. That is right. It is necessary that the individual performance of each well be studied.

[fol. 5092] Q. What is the definition of the slope that you used in pressure decline, in pressure decline per year?

A. I would say that it is a judgment curve.

Q. How much in pounds per year?

A. It is not a constant in pounds decline per year.

Q. Well, now, if you set your triangle, as you say you did, there was a slope, was there not? A. Right.

Q. What was that slope?

A. Do you have a protractor handy? I will be glad to measure the slope for you.

Q. Well, can't you tell us without a protractor what the measurement is of your slope in pounds decline per year?

A. If you wanted it in pounds decline, yes, sir.

Q. Yes.

A. I thought you meant the angle with the horizontal of this curve, that is what I thought you had in mind.

Now, you want that year by year, do you?

Q. Just at the beginning point of your single curve in 1941.

A. There would be none just at the beginning point, unless you would extend it on to some period.

Q. Well, the slope extends from the beginning point, [fol. 5093] does it not?

A. Yes, sir, for one year. Do you mean for the next year, Mr. Littman?

Q. Well, you were speaking of the slope that you just developed. Now, what rock pressure decline do you show for the first year? A. 11 pounds.

Q. And that would be from 1941 to 1942, wouldn't it?

A. Yes, sir.

Q. What do you show for the next year?

A. Approximately 12 pounds.

Q. Now, what is it for the next year, which would take you to 1944?

A. Midyear pressure, 1944, is estimated to be 310 pounds.

Q. What is the rock pressure decline in that year?

A. Slightly over 12 pounds.

Q. What is it for the next year, that is, to the middle of 1945?

A. Approximately 13 pounds.

Q. Now, let's go back.

How did you determine that there would be an 11-pound drop between 1941 and 1942 in rock pressure?

A. By the application of past field performance and judgment.

[fol. 5094] Q. Did you do that, year by year?

A. Oh, yes.

Q. And, having determined the pressure drop for each year by your judgment, you then drew the curve accordingly? A. Yes, sir.

Q. Now, does that explain the method of drawing the curve, that is, the ascertainment by you of the drop each year in rock pressure decline, according to judgment, for the areas?

A. I believe I so testified, from the beginning, that it was a judgment curve.

Q. Well, Mr. Hinton, we are earnestly endeavoring to understand your method, and this latter testimony may be the touchstone to clearing us up, and I want to make certain we understand you.

You started, as you said a minute ago, with the 340-pound pressure reading for all of the wells in Group Area "A" in 1940. Is that right?

A. That is right. That is the arithmetical average of the 15 wells located in that group area.

Q. And the next thing you did was to determine how much decline there would be in the rock pressure in the succeeding year or throughout the succeeding year?

A. That is correct.

Q. And you arrived at that, not by a mathematical formula or any mathematical calculations, but purely by your judgment of the matters which you have already enumerated?

[fol. 5095] A. With the field performance of the total field as a guiding factor, to some extent, in all cases.

Q. And that guiding star, so to speak, was the curve that was designated as Curve "C" in Exhibit No. 133?

A. Yes, sir. I felt that the relationship of each group area to the whole field would be as is expressed on this series of judgment curves from 136-(1) to 136-(10).

Q. You concluded, with respect to Group Area "A", Exhibit 136-(1), that by the middle of 1942 the wells would have suffered a decline in rock pressure of 11 pounds? A. That is correct.

Q. From the previous year?

A. Yes, sir.

Q. Now, what decline would have resulted had you literally applied the rate of decline developed from your curve designated as Curve "C" in Exhibit No. 133?

Mr. Culton: You are speaking now from 1941 to 1942?

Mr. Littman: Yes, the figure that would be comparable to the 11-pound drop.

The Witness: About 12½ pounds.

By Mr. Littman:

Q. You had the 12½ pounds in mind when you worked on chart, Exhibit No. 136-(1), did you not?

A. That is right.

Q. And you concluded to use 11 pounds of drop in [fol. 5096] pressure for that year, rather than 12½, did you not?

A. In that particular group area, I did.

Q. Now, if you will explain to us why you used 11 instead of 12½, it might further help to clarify your method.

A. The reason the 11 pounds was used was due to the fact that the permeability in the portion of the group

area in which we have our development is low, and the rate of travel through this gas is likewise slow.

Therefore, I did not feel that we would suffer a great deal of drainage to the area to the east because, even though there is a greater pressure gradient from our development to the northeast than there is from our development to the west, the other way, the ratio on the difference of squares on the two areas of pressure indicated to me the flow of gas would be about the same and what went into the lower-pressure area would be compensated by what came in from the higher-pressure area.

Mr. Calton: Point out on the map where those higher-pressure areas that would feed into your wells are located.

The Witness: To the west and southwest and south also.

By Mr. Littman:

Q. Well, now, why didn't you conclude that 11¼ pounds would be the right figure to use, rather than 11 pounds?

A. Well, now, if you are going to get down to quarter-pounds, why, then you are going beyond what I feel would [fol. 5097] be anything that would be close to a judgment figure, because a judgment figure has more deviation than a quarter-pound.

Q. Well, I just wondered how you arrived precisely at 11 pounds from the original 12½-pound figure, and I take it by your answer that it is purely a matter of judgment?

A. That is right, and that could have been 11.3 or 10.64 and it would still be in the realm of what I consider good judgment.

Q. Why, for instance, didn't you arrive at 10 pounds instead of 11 pounds?

A. Because I did not think it would be right.

Q. As a matter of general judgment?

A. As a matter of general judgment, and I ask you to come and observe the past performance of these wells, and you will see why it will not be right.

. . . . . .

[fol. 5098] By Mr. Littman:

Q. Now, for the period representing a year from the middle of 1942 to the middle of 1943, I believe you stated

you estimated that the wells in Group Area "A", belonging to Panhandle Eastern Pipe Line Company, would decline 12 pounds in rock pressure. Is that correct?

A. That is correct.

Q. And having found that to be the fact, according to your judgment, you then projected your curve on through that point on chart, Exhibit 136-(I)?

A. That is right. However, I would say that I did not know that that was going to be 12 pounds until after I had projected that curve.

Q. Well, how did you project the curve from the middle of 1942 to the middle of 1943, without knowing where it was going to fall?

A. I merely observed the past performance of all wells and extended the indicated future performance by placing a triangle on the past performance and extending it, giving consideration to the increased decline that I thought would be felt in that area for that period.

Q. Now, is that all that you can tell us about how you extended the curve?

A. No, sir. I can repeat from all the things that one has to keep in mind as this extension of the pressure [fol. 5089] curve is made.

Q. Well, it looks like we are right back where we started from, Mr. Hinton. I understood you to say just before the recess that you determined, by judgment, the amount of decline to be expected in each year, and then plotted your curve through the point indicated.

A. That is true when the curve reached a point several years in advance of the data which is now on record.

Q. Well, of course, the years that we are speaking of are the future years.

A. That is correct, but it is a simple problem to extend a curve into the future for the next two or three years. It is at the point ten years beyond the present where it is difficult.

Q. Well, suppose you tell us how you projected your curve ten years into the future, which would bring you to 1950?

A. When the 1950 period is reached, the group areas will be acting, each of them, very much like the field as a whole, because at that time there will be but very little undeveloped acreage in the Panhandle Field, and

the withdrawal will, therefore, be spread over the entire field instead of in concentrated areas of the field.

Q. And, on and after 1950 you then applied, literally, the curve designated as Curve "C" in exhibit 133?

[fol. 5100] A. By "literally", you mean with some degree of cut and fill, or do you mean that it is exactly a reproduction of the curve shown on Exhibit 133?

Q. Well, suppose you tell us the extent to which you gave weight to the curve in the chart, Exhibit No. 133, on and after 1950.

A. I couldn't express that in percentage. I would say that considerable weight was given to it, because the whole field at that time is going to be acting about the same, although there will be variations, due to permeability and increased withdrawal from certain portions of the field.

We must remember that in the East Field at the present time there is considerable production obtained, but when we reach the 1950 period, it is quite probable that there will be very little remaining production in the East Field.

Now, the companies which are now obtaining production from the East Field will have moved their withdrawal from the East Field over to the West Field, and the total amount of gas will be coming from a smaller reservoir than it now comes.

Q. Well, how much weight would you say you gave to the Curve "C" in Exhibit 133 on and after 1950? Would you say you gave it approximately 90 percent weight, 75 percent weight, or what?

A. I would say that I gave it considerable weight.

Q. But you can't express, even in percentage, how much weight?

[fol. 5101] A. No, because the percentage varies to a certain extent in each of the group areas.

Q. What is the average pressure decline for the past five years on company wells in Area "A"?

Mr. Culton: Do you mean annually, or on a basis of production?

Mr. Littman: Annually.

The Witness: Approximately 40 pounds.

By Mr. Littman:

Q. Per year?

A. No, for the last five years. That is what your question was, I believe.

Q. Now, that would be an average of about 8 pounds' drop per year?

A. That is right.

Q. Now, will you give us the same figure for each of the charts and areas, designated for identification as Exhibits 136-(1) to 136-(10), inclusive? You have given us 136-(1).

Now, suppose you go to the next chart.

A. All right. I think it only fair to explain to you here that, without giving consideration to the rate of withdrawal for those five years, you might get an ide. that would not be correct, because the rate of withdrawal from most of these areas was much lighter five years ago than it is today.

[fol. 5102] Mr. Culton: What is Page 2? Group "B"?

The Witness: No, Page 2 is the gas purchase wells located in the group areas.

By Mr. Littman:

Q. Exhibit 136-(2)? A. Yes, sir.

Mr. Wheat: That is located in Group Area "A"?

The Witness: Yes.

I don't have those averaged for five years for the period commencing in 1935, but the decline has been, I would say, approximately, 25 pounds, that being from an average pressure of approximately 251 pounds down to an average pressure of 226 pounds.

By Mr. Littman:

Q. All right, will you give us the figure for the next one? Incidentally, is that the figure per year?

A. No, that is for the—.

Q. (Interposing) For the five years?

A. For the five years, and the rate of production has been quite high from those wells, and from that particu-

lar area. I want to call your attention to the fact that there was only a drop of 25 pounds for this same comparative rate of production, due to the fact that these wells have been fed by migratory gas, and as soon as the pressure is lowered in the rest of the field where it [fol. 5103] is no longer possible for this gas to migrate into this area, these wells will decline very sharply, as is beginning to be felt or shown during the past year.

Q. Now, that average is five pounds per year?

A. Five pounds per year.

Mr. Culton: By the way, is it true or not that, in that area, the gas purchase wells have lesser pre sure than the company-owned wells?

The Witness: Yes, sir.

Mr. Culton: And the higher-pressure wells are suffering the greatest decline in pressure per annum in that area?

The Witness: Yes, generally speaking, that is correct. The Chapman Well, which is owned by the Huber Petroleum Corporation, has a pressure which could be compared to the average pressure of our 15 wells in that area.

At the same time, we have two wells, Burnett 1-108 and Burnett 1-119, that are considerably lower than the average.

Mr. Culton: But speaking as a rule, your higher-pressure wells have suffered the greatest decline in pressure?

The Witness: Naturally.

Now, on Exhibit 136-(3), the average pressure in 1935 was 417 pounds; in 1941, the average pressure was 371 pounds.

By Mr. Littman:

Q. You better go back and start from the beginning [fol. 5104] and state the six-year drop and the average for the six years.

A. You asked for five years, and I went back to 1936. The pressures which I have given you for 136-(1) are for the five-year period, starting midyear 1936 to midyear 1941.

Q. Just so that you are consistent throughout with either the five years or the six years.

A. Yes, it is my error.

Q. Now, we have the five-year period for Exhibit 136-(1). Now, what do we have for Exhibit 136-(2)?

A. The pressure drop is approximately the same, because from 1935, the point previously given, to 1936, many of those wells were curtailed in production if the rate at which they had been producing showed a pressure increase, so, although it is not averaged, I don't believe it would be one pound different.

Q. You mean the same as you had given a moment ago, or the same as those on the previous chart?

A. Yes, that being approximately 250 pounds, and that is for the midyear period 1936, down to 226 for the midyear 1941.

Q. What is the total drop for the five years?

A. 24 pounds.

Q. And the average would be 4.8 pounds per year?

A. Yes.

Now, for Exhibit 136-(3)—

[fol. 5105] Mr. Wheat: What area is that?

The Witness: That is the company wells located in Group Area "B".

The pressure, midyear, for 1936 was 411 pounds, and the average at the midyear test, 1941, was 378 pounds, a drop of 33 pounds for the five-year period.

By Mr. Littman:

Q. That is an average of how many per year?

A. 6.6 pounds per year.

Q. Now, will you continue through the exhibit?

A. Yes, sir. I will try to hurry a little more, too.

For Exhibit 136-(4), showing gas purchase wells located in Group Area "B", the midyear pressure, at 1936, average was approximately 402 pounds, and midyear 1941, for the same group of wells, the pressure was 363 pounds, both of those being approximate figures, or an average of 7.8 pounds per year.

Q. And 39 pounds over the five years?

A. Yes, sir.

For Exhibit 136-(5), showing the company wells located in Group Area "C", in 1936 the pressure average for those wells was 347 pounds. In the year 1941 the average pressure was 318, a total of 29 pounds drop, 5.8 pounds average for the five-year period per year.

The gas purchase wells, located in Group Area "C", [fol. 5106] have not been averaged, other than for 1941. I can give you very close to an approximate figure on that. It is from approximately 340 pounds, about 325 pounds for the midyear period 1936, and 289 for the midyear period 1941, being a drop of 36 pounds or 7.2 pounds average per year.

The pressures for Exhibit 136-(7), showing company wells located in Group Area "D", there were no wells drilled in this area in 1935. The first well on which we have a pressure was drilled in the first part of 1936 and came in at a pressure of 397 pounds. The present average pressure for that group of wells is 343 pounds, a total drop of 54 pounds, or 10.4 pounds per year.

Mr. Wheat: 10.8; isn't it?

The Witness: Yes, 10.8.

The exhibits 136-(8), (9) and (10), although they carry the title of the company wells, the extension of the pressure curve will apply to both the company and purchase wells, inasmuch as that is a highly permeable area, and the pressures will have a tendency to equalize on all wells located in those areas.

The average pressure for the company wells located in Group Area "E" for 1936 was 412 pounds. The average pressure for the wells located in Group Area "E" for 1941 was 358 pounds, a total drop of 54 pounds and an average of 10.8 pounds per year.

[fol. 5107] By Mr. Littman:

Q. Did you give the figures for the gas wells of Panhandle Eastern's vendors in Group Area "D"?

A. No, that same situation applies to "D", which is the area located to the west of the Sneed compressor station. In that area there, the wells are located fairly close together and, I think, we can safely apply the pressure-

trend curve shown on "D" for the company wells to gas purchase wells.

Q. You did so apply the data, did you not?

A. Yes.

Mr. Culton: That is true as to "D", "E", "F" and "G"?

The Witness: Yes.

By Mr. Littman:

Q. In other words, you are not going to give us any separate figure for the gas-vendor wells for those areas?

A. No.

Q. Very well.

A. Exhibit 136-(9), the average pressure for the wells in that group—

Mr. Wheat: (Interposing) What is that group?

The Witness: That is for the company wells located in Group Area "F".

The average pressure for those wells in 1936 was 408 pounds. The average pressure of the group of wells located in that area in 1941 was 356 pounds, a drop of 52 [Vol. 5108] pounds, or 10.4 pounds per year.

The wells shown on Exhibit 136-(10), which is the pressure trend for company wells located in Group Area "G", had an average pressure at the mid-year test of 1936 of 405 pounds.

The average for the same wells in 1941 was 354 pounds, a drop of 51 pounds for the five years, or an average of 10.2 pounds per year.

I am glad that you had me go through these, because I believe now that you can see that there is a tendency for a sharper drop in the areas by going through them that you might not have observed without doing so.

By Mr. Littman:

Q. You mean a sharper drop than what?

A. Than you perhaps had in mind, because I have noticed several times that you have talked about extending the same pressure curve that was obtained through the earlier years of the field.

Q. A while ago you referred to two low-pressure wells in Area "A". Will you give us the location of those two wells and their names?

A. Yes, sir.

The first well mentioned is the Burnett 1-108, which is located in the south half of the southwest quarter of Section 108, Block 5, I. G. and N. R. R. Company Survey.

The other well mentioned is located in approximately the [fol. 5109] center of the southwest quarter of Section 119, Block 5, I. G. and N. R. R. Company Survey, both in Carson County, Texas.

Mr. Culton: Those are both near the north line of Area "A"?

The Witness: That is right, although there is a surprisingly small distance between these low-pressure wells and our wells which carry considerably higher pressure which, again, points to the low permeability of that section.

Mr. Culton: There isn't good feeding into those wells, in other words?

The Witness: From areas of higher pressure, that is correct.

By Mr. Littman:

Q. Now, Mr. Hinton, I note that each of the lines in your Exhibits 136-(1) to (10), over at the extreme left corner of each of these charts, is designated by a number. What do those numbers represent?

A. Those are identification numbers which were placed upon there so a reference could be made to the observed pressures for any year for any well.

Q. How could we identify any of these wells from those numbers, for instance?

A. By stating the summary of the group areas and—

Q. (Interposing) In your working papers?

[fol. 5110] A. In my working papers.

Mr. Culton: That is the key to your working papers, in other words?

The Witness: Oh, yes.

By Mr. Littman:

Q. It is not the key to the map, Exhibit No. 46, is it?

A. When you say "key", yes, I would say that it would be possible to obtain the names of the wells and the locations; by referring to the list from which this pressure-trend chart was made, it would be possible to locate any well that was desired.

Q. And that list is contained in your working papers?

A. That is correct.

Q. I hand you your working paper, File No. 11, and ask you whether the pages which I show you are the ones that you just referred to.

A. Yes, said pages carrying the title of "Group Areas West Panhandle Field, Rock Pressures" and the wells for each group placed thereon and the observed pressures listed, commencing with 1931 or before and carrying through the midyear pressure of 1941.

Mr. Culton: Mr. Littman, in order that data shown on Exhibit 136 may be verified in that respect, we will be glad to reproduce that working paper so that it may go in evidence.

Mr. Littman: I appreciate your suggestion and concur [fol. 5111] that it would be very helpful.

Mr. Wheat: How many of those sheets are there?

The Witness: Not very many.

By Mr. Littman:

Q. Now, Mr. Hinton, you assembled data which showed the withdrawals from all of the wells shown on your Exhibit 136-(1)?

A. Yes.

Q. Exhibits 136-(1) to 136-(10)?

A. Yes, sir.

Q. By years?

A. By years.

Q. And you, also, had to assume certain withdrawals for each of those wells for each of the years in the future? Did you not?

A. That is correct.

Q. Are those data in your working papers?

A. Not future anticipated withdrawals by wells, no.

Q. Do your working papers show the withdrawals in the future years?

A. No, sir.

Q. By group areas?

A. No, sir.

Q. But you made a determination of them, did you not?

[fol. 5112] A. Yes, it could be assumed by group areas the withdrawal. The deliverability was worked out by group areas.

Q. Now, I would like to have you furnish us with a statement showing the withdrawals by wells for the past, that is, prior to 1941, and the withdrawals for the future years by group areas.

A. That will mean that I will have to make some further calculations because, as I have said, I worked out the deliverability by group areas and, of course, the only way that we could arrive at a future withdrawal figure by group areas for a particular group of wells is to apply the percent of deliverability that could be obtained.

Q. Well, I thought you said a while ago that one of the factors you considered in making this estimate was the amount of gas that was going to be withdrawn from these wells in the future.

A. I did, but when I said, "from these wells", I was giving consideration to all of the wells in these group areas and those that will probably be drilled in the future because unfortunately, we cannot control the withdrawal from the field by our development, and it is necessary to take everyone's development into consideration to arrive at an answer which would be approximately correct.

Q. Well, were you referring to other people's wells?

A. Oh, yes. I have files which show the amount of gas [fol. 5113] that has been produced from every well located in each of the group areas from "A" to "G".

Q. Over what period?

A. Over the past five-year period.

Q. And did you, or did you not, make any assumptions as to the production from each of those wells for each of the future years?

A. Not by individual wells, but in total.

Q. Beg pardon?

A. Not by individual wells, but in total I did, and it is so shown on Exhibit 134.

Q. By "total", do you mean by group area?

A. No, no specific amounts from any individual well, no, sir.

Q. I am not referring to individual wells now. You just indicated that you do that.

A. Yes.

Q. But you said you made some determination of the total withdrawals in the future. Now, what do you mean by "total"? Do you mean total of the wells in the Panhandle Field, or do you mean total of the wells by group areas?

A. I mean the total of all wells in the Panhandle Field as the guiding factor and the withdrawal from all wells in each group area as a further guiding factor.

Q. You mean you considered the total withdrawals [fol. 5114] expected to be made in each of the group areas in the future years?

A. Yes, sir.

Q. Now, do you have those figures?

A. No, I do not, because much of that was mental. I just projected in my thought and knowing that there would be certain changes in the source of withdrawal.

Q. Well then, in view of the fact that your estimate of withdrawals in the future by areas was purely a mental figure, not reduced to writing, we will ask you for the past history by wells.

A. Do you mean all wells or just the company wells?

Q. All wells.

A. Oh.

Q. What is wrong with that?

A. Well, that will be approximately 100 sheets of 14-column paper.

Q. Well, how did you use those data, Mr. Hinton, if it was so voluminous?

A. I made totals of each group of wells and made summary sheets.

Q. Well, do you have the summary sheets?

A. I do.

Q. Are they in your working papers?

A. Yes, sir.

[fol. 5115] Q. Will you please identify those?

A. I will take it back, sir, those files should be in. They are coming in by express and those heavy ones are the ones that were missing here yesterday, and they are coming by express.

I can identify them as soon as they get here. I will be glad to do anything to save copying all those individual records.

Q. All right, we will pass that for the present.

If the curves shown on Exhibit 133 had been different, would that difference have affected the curves which you drew in Exhibits 136-(1) to [(1),] inclusive?

A. You say, would they have been different, also?

Q. Yes.

A. That would be correct, they would be different.

Q. In other words, you used the curves in Exhibit 133 as the major guide? A. Yes, sir.

Q. In your development of the future rock pressure decline in the various areas, group areas?

A. Yes, sir.

Q. Now, what is the next step in your method? Having determined in Exhibits 136-(1) to (10), inclusive, what the expected rock pressure readings would be in the future years on company owned wells and on wells from which gas is purchased, what did you then do?

[fol. 5116] A. I then applied the estimated pressure to our back-pressure data, which has been placed upon curves, and found out, as nearly as possible, what the open flow and deliverability of those wells would be, year by year.

Mr. Culton: You are referring to the individual wells, the back-pressure curves?

The Witness: No, in order to avoid having so many curves, I placed all of the wells located in each of the group areas on one back-pressure curve.

By Mr. Littman:

Q. What do you mean by "back-pressure data"?

A. That is a method used in the testing of gas wells. The data was obtained from such tests.

Do you mean what is a back-pressure open flow test? Did you want me to tell that?

Q. Yes. That might answer the question.

A. A back-pressure open flow test is a method of testing gas wells which has been developed by the United States Bureau of Mines, and is more completely described in Monograph 7 of the United States Bureau of Mines.

The test of a well is obtained by producing the well, usually through a critical flow prover or orifice meter, at such a rate that arrives at a stabilized flow where there is no change in pressure. That is repeated, usually for four rates of flow for each well.

[fol. 5117] After this data has been obtained it is then necessary to go through and work out the data by formulas which have been furnished by the United States Bureau of Mines and the Railroad Commission of Texas, and the observed pressures are converted to absolute pressures and squared.

The rate of flow is obtained by applying known coefficients for certain orifice plate sizes and are corrected for both temperature and specific gravity.

The difference in the square of the absolute pressures at various points of stabilization plotted against the rate of flow on logarithmic paper, log-log, it being the same scale both ways, will produce a straight line through all points if the test is satisfactory.

Q. Do you have your back-pressure curves here?

A. Yes.

Q. Without going into too much detail, I wish you would take one of them and explain the operation of the curves on the chart.

Mr. Culton: In that connection, on the assumption that, having made your curve, it is really a straight line, is it not?

The Witness: It is on logarithmic paper.

Mr. Culton: You can then determine what the well is capable of delivering at any given pressure, if there is no [fol. 5118] change in the physical condition of the well?

The Witness: Yes, that is correct. I did not complete my explanation there.

(Continuing) Because the absolute open flow is obtained by observing a closed-in well head pressure, converting to absolute and squaring that pressure and then adding the weight of the column of gas to that. The intersection of the lines, which is drawn through the four test points with a horizontal line placed on the graph at the point the pressure places it, gives the absolute open flow of the well.

This particular graph which has been placed on the easel is for the company wells located in Group Area "A".

Mr. Culton: Mr. Examiner, I suggest that that should be marked for identification in some way. I don't know whether counsel expect to offer it in the record or not.

Mr. Littman: There are a number of these and I didn't think, Mr. Culton, that it would be necessary to offer any more charts on this subject. My understanding is that the logarithmic chart is a mathematical method of determining the deliverability of the wells and I thought, perhaps, if Mr. Hinton explained, it might be sufficient.

Mr. Culton: All right.

The Witness: The small circles shown on this graph represent a point of stabilized flow for the well. It can be noticed that in most cases there are four shown for each well, however, some of them have three.

[fol. 5119] The Railroad Commission of Texas requires that we take four points. That is in the event that one point does not show complete stabilization at the completion of the calculation of the test, the other three can be used without going to the field to secure additional data.

Mr. Culton: In other words, the point is a certain rate of flow?

The Witness: That is right.

Mr. Culton: And you have to make a test on these four different rates of flow?

The Witness: That is right.

Now, in order to apply the pressure decline to this graph, we merely take the pressure which is shown, that is, that can be expected, by reading down the graph for any year—

By Mr. Littman:

Q. (Interposing) You are referring to Exhibit 136-(1) to (10), inclusive?

A. (1) to (10); and by squaring that pressure after it has had a barometric pressure added to it, which is whatever barometric pressure should be added for that portion of the country.

That is then squared and multiplied times an Es factor which gives consideration for the weight of the column of gas in a producing string of the well.

[fol. 5120] By taking that square of that well and plotting it on the graph, then the absolute formation open flow of that well can be read. If the open flow is desired to only the top of the well, the application of the Es factor is not applied.

Q. But you do not use the open flow in your estimate, do you?

A. No, not to any extent, other than this, that the State law provides that it is not lawful to produce a well at a greater rate than 25 percent of its absolute open flow. Naturally, we cannot lower our working pressures at any time, so that the amount of gas that we take from those wells will exceed 25 percent of the potential of the well.

Mr. Culton: I believe this fact may come in, after you have determined three points in a line, you then draw your line through those three points, do you?

The Witness: That is correct, yes.

Mr. Culton: Now, is it true that by extending that line to higher pressures or lower pressures, you can determine what that well would deliver at those higher or lower pressures, respectively?

The Witness: You can tell what the absolute open flow will be.

Mr. Culton: That is what I meant.

The Witness: In order to find out what that well will deliver, it is necessary to take the difference in the squares [fol. 5121] between the working pressure of the well, atmospheric pressure, and then read that on the graph here.

If the difference in squares should happen to be 10, then we will read at the bottom of the chart the amount of gas that well will deliver.

By Mr. Littman:

Q. What do you mean by "working pressure"?

A. The pressure at which the well is forced to produce gas.

Mr. Culton: There that would be zero.

The Witness: It is really back-pressure, that is what it is.

By Mr. Littman:

Q. Is that at the top of the well or where?

A. This usually occurs at the top of the well, yes, sir. There could be a partial break in the well, whereas the working pressure, actual pressure, which the formation was forced to produce against, would be different than the working pressure on the system into which it is produced.

Q. Have you completed your explanation of the logarithmic chart?

A. If everyone understands it, I have.

Q. Will you please identify each of the symbols appearing on that logarithmic back-pressure chart?

A. The vertical scale on this log paper is shown as [fol. 5122] thousands P_f squared minus P_s squared, that being the difference between the pressures at the formation and the pressure at which the stabilized flow was obtained.

The horizontal scale reads in Q in M. c. f. per day and this is 100, 1000 and 10,000 M. c. f.

. . . . . .

[fol. 5125] By Mr. Littman:

Q. Mr. Hinton, will you define the meaning of the term "P_f" as it is used in your logarithmic charts which have been here referred to as back-pressure charts?

A. "P_f" stands for the absolute formation pressure in the reservoir.

Q. Did you derive those pressures from the pressure-trend charts which have been identified as Exhibits 136-(1) to 136-(10)?

A. Those pressures are not reflected upon the back-pressure open flow chart.

Q. Where did you secure your P_t values in making your estimate?

A. To what estimate do you refer?

Q. Your estimate of gas that will be recovered, as shown in Schedule 5 of your Exhibit 43.

A. Yes, the—

Q. (Interposing) "Yes" what?

A. I was going to finish.

The application of the pressures shown on Exhibit [fol. 5126] 136-(1) to (10), inclusive, are applied to the back-pressure open flow curves and the P_t is obtained by taking the well head pressure at each point of test, mid-year test, and by—

Q. (Interposing) For each year shown in Exhibit 136-(1) to (10)?

A. Yes.

(Continuing) And making the proper allowance for the weight of the moving column of gas in the producing string of pipe and also adding the barometric pressure to the well head pressure to convert it to absolute pressure.

Q. Now, will you please define the P_s pressures which are shown on your back-pressure charts and which you used?

A. The P_s pressure is obtained by observing a pressure at a stabilized rate of flow, and then making the proper allowance for the weight of the moving column of gas in the producing string and by adding the barometric pressure to the pressure, that is, well head pressure plus the weight of the moving column of gas to convert it into absolute pressure, and that is the sand face pressure at that rate of flow.

Q. Where did you obtain your P_s pressures which you used in making your estimate?

A. I obtained them from the pressure-trend charts, Exhibit 136-(1) to (10), inclusive.

Q. I am now speaking of P_s not P_t.

A. That is right.

[fol. 5127] Q. How did you obtain the P_s pressures from Exhibits 136-(1) to (10)?

A. By taking the capacity of the pipe line system into consideration and finding out what the working pressure at the well head would be at the various years, and by so obtaining the working pressure, I then obtained the P_s data.

Q. Now, the P_s pressures bear a relation to the pressures at the first compressor station which, in this case is Sneed?

A. Yes, that is correct.

Q. And those pressures are higher than those which are at Sneed at various years?

A. That is correct. If they were lower, the flow of gas would be from Sneed station back into the well, rather than from the well to Sneed station.

Mr. Littman: Will you please read back that last answer?

(Whereupon, the last answer was read by the reporter.)

By Mr. Littman:

Q. Are the P_s pressures which you used in making the calculation set forth in your working papers?

A. They are, but they are not in the best form that could be obtained or produced, due to the fact that there was a very, very short time to solve a problem of this size.

It was necessary to go into some approximations. There-
[fol. 5128] fore, the data that are reflected in working papers are to the degree of accuracy that can be obtained by the application of an average pressure to an average back-pressure open flows of the wells located in each group area.

I might add that since that time I have been working, as time was available, on trying to detail those by taking each well and assuming that the pressure drop on each well would be the same as the average for all wells in the group and trying to get, maybe, a more complete answer by working the problem in that manner.

Regardless of which manner or which method is used, there is going to naturally be some degree of error. It is impossible to make a forecast into the future that will be absolutely accurate.

Q. Within what percentage range would you say that the figures might be off, one way or another?

A. Assuming that the characteristic of the well does not change, I would say that the percentage of error should not be greater than five percent.

However, again, the accurateness of the estimate is changed, because we know from experience that the characteristics of those wells will change, and the change will be a decrease, and we make our future estimate based on the present characteristic of the wells.

We are certain that that is the best possible amount that [fol. 5129] could be expected.

Trial Examiner: The method that you have been describing has to do with the present characteristic of the well, has it not?

The Witness: Yes, sir.

Trial Examiner: Is that the method used by other men engaged in similar problems in that field?

The Witness: Yes, sir.

Trial Examiner: So that the method you have described and which you have now applied, is the customary method to determine the present conditions of the wells?

The Witness: That is correct.

Trial Examiner: That prevails throughout the industry in that area?

The Witness: In the Panhandle Field, yes, sir.

By Mr. Littman:

Q. You stated a while ago that you secured the P pressures from Exhibit 136-(1) to (10), inclusive, is that right?

A. That is the basis for them, yes, sir. They are not taken directly from them.

Q. Will you give us an example, a specific example, of how you developed the P pressures?

Trial Examiner: Before you do that may I ask one more question relating to those I just asked. How long

[fol. 5130] in the past has this method been in common usage?

The Witness: By two of the major companies in the Panhandle, namely, the Texhoma Natural Gas Company and the Canadian River Gas Company, this method has been in common usage since 1931.

As far as our company is concerned, it is only during the past three years that we have adopted this method.

Trial Examiner: Is this the method employed by the Railroad Commission, in so far as they make tests of their oil?

The Witness: No, sir. It is approximately the same. I am not quite sure what method they might be using, but they did use the draw-down method, which is, in oil, similar to the pull-down in the gas industry?

Pull down the pressure from the closed-in pressure for a certain rate of flow and in the oil, they pump so many barrels per day and they find out what the pull-down has been on that well.

I am not too familiar with the testing of oil wells, however.

Your question, Mr. Littman, was to give a specific example of how the P_s pressure is obtained.

By Mr. Littman:

Q. That is right, and make reference to your working papers as you go along, identifying the exhibit and the working paper from which you derive your figures.

[fol. 5131] A. From the working paper, File No. 11, titled "Group Area Rock Pressure Summary for Texas", we will turn to the sheet for Group "A".

Now, in 1942, we hope to be able to furnish an intake-suction pressure to the Sneed station of 293 pounds. The working pressure average for Group Area "A" [hwith] that pressure will be 317 pounds gage, which, converted to absolute, will be 330.2.

The 330.2 is then squared and the square of 330.2 pounds is then multiplied by the Es factor which provides a proper consideration for the weight of the moving column of gas

in the producing string, and thus the P_s pressure is obtained.

Q. The result which you obtain by the method which you just described gives you P_s squared, rather than the P_s pressure, does it not?

A. Yes, it does. The P_s can be obtained by taking the working pressure at the well head absolute and adding the weight of the moving column of gas to it.

I am sorry that I did not describe that properly at first.

Q. Now, you showed us how you arrived at the P_s pressure from the Sneed station.

A. Yes, the difference in the pressure at the intake side of Sneed station and the working pressure at the well head is governed by volume and capacity of the pipe line system.

Q. But you did not show us how you arrived at the P_s [fol. 5132] pressure from the pressure-trend chart, Exhibits 136-(1) to (10).

A. All right. The pressure-trend charts show what pressure can be expected in each of these group areas. Then, by experience, we know, by observing the pressure drop in the pipe line system, what pressure drop there will be between the intake side of Sneed and the well head.

Therefore, the intake pressure of Sneed is governed entirely by the pressure-trend of the well.

Q. Isn't it a fact that you set the pressure at Sneed station by basing it upon the pressures at the wells?

A. That is right, the pressures at the wells govern the intake pressure at Sneed.

Q. And you have agreed to supply us with the working pressures that you used? A. Yes, sir.

* * * * * * * *

[fol. 5133] By Mr. Littman:

Q. Now, Mr. Hinton, it appears that we are near the end of the step-by-step description of your method.

A. May I make an addition to the answer to your last question; when we agreed that the pressure at Sneed is governed by the well head pressures, I would like to say that it is going to be necessary to install some individual compressor units to hold the Sneed suction pressures that have been set out here.

That is, all wells are not going to be able to produce gas with a working pressure at the Sneed station set out here.

I just wanted to make that clear here, that it will be necessary to install some individual well compressors.

Trial Examiner: Is that partly due to the lack of uniform pressures as between different wells feeding into the laterals?

The Witness: Yes, that is right; and there are some wells that are entirely different from the wells surrounding it and I give, for example, our well located on the Sneed Ranch in Section 28.

That well has never been able to produce a quantity of gas that compares with the quantity at this time that can be produced by the wells surrounding it.

By Mr. Littman:

Q. Now, Mr. Hinton, if I correctly understand your tes- [fol. 5434] timony with respect to the last step which you described, you used the curves shown in Exhibit 136 (1) to (10), inclusive, for the purpose of determining the rock pressure of the wells of Panhandle Eastern and its vendors in each of the areas in the future years, is that right?

A. That is correct.

Q. And using that information and those data, you then applied these various pressures that you described and applied the logarithmic charts, called the back pressure charts and from those charts worked out the amount of gas that will be expected to be derived from the wells in each of the areas, Groups "A" to "G". Is that correct?

A. Yes, that is substantially correct, other than it has been assumed, in all cases, that wells owned by other than Panhandle Eastern, the gas purchase contract wells, will supply horsepower as required to enable them to put gas into our system or they will be forced to install some individual well compressors, the same as we will, and I assumed all the way through that both Panhandle Eastern and the other [owners] of the wells connected to our system will install additional horsepower whenever necessary.

Q. Will you state how you then secured the figures of production in the West Panhandle Field which appear in Schedule 5 of your Exhibit 43, and in Exhibit 131?

A. That being the total amount of gas which is expected [fol. 5135] to be produced from the Panhandle Field, both under the basic load or present volumes and future anticipated volumes.

Q. We were referring to the future load.

A. The future load, yes, that is substantially correct, other than you will note that they are all round numbers, which indicate I do not mean that that is exactly the amount that we will be able to take, but I feel that it will be very close to it.

Q. I wanted you to complete the last step of your method by which you secured the figures shown in Exhibit 131 and in Schedule 5 of your Exhibit 43.

A. In order to determine what amount of gas a well will deliver, it is necessary that the working pressure at the well head be obtained and made into an absolute pressure and squared, multiplied times an Es factor or the weight of the moving column of gas added to that pressure to get the sand face pressure at the rate of flow at which that well will work.

It is then necessary to take the closed-in pressure by gaging the well and converting that into an absolute pressure and squaring it, then multiplying it also by the Es factor, which obtains the closed-in formation sand face pressure.

The difference in the squares of those two numbers is then placed upon the back-pressure open flow chart and the result is read from the horizontal scale, which will rea- [fol. 5136] sonably closely tell the amount of gas that can be expected to be produced at that working pressure from that well.

Q. And you did that for each well?

A. No, I told you a while ago I did not have time to do it for each well, and it is not in my working papers. I used an average all the way through, but I have been working it out by wells since. I do not have it complete.

Q. You secured the production figures for each area?

A. Yes.

Q. By the method that you have described and separately as between Panhandle Eastern's own wells in each area and as to the purchase wells in each area, is that right?

A. Yes, I believe that is right, except that the amount of gas that is going to be taken from purchase wells and company wells is not governed by deliverability alone, because we prorate our gas on a formula which allocates 50 percent of the total amount on the basis of acreage alone.

Therefore, the acreage, unless that formula is changed, will always remain constant and, in the division of that gas, it was assumed that the open flows of the purchase wells and the company wells would decline at a parallel rate, and the division of the gas was obtained by allocating half of that production on the basis of acreage and half on the basis of open flow.

Therefore, the result was not obtained by deliverability [fol. 5137] alone.

Q. And then you added the total production thus indicated to each area to secure the total amount of gas which you estimate will be produced in the West Panhandle Field in each of the future years from 1942 through 1960 shown in Exhibit 131?

A. I do not believe that is reflected in my working papers, but that is true, that is what was done.

Q. What I was endeavoring to establish was simply this, Mr. Hinton, that you made the estimate for each of the areas for each year, and then totaled the estimate production for each year and included them in the columns as shown in Exhibit 131 for the West Panhandle Field, isn't that right?

A. They were made on that basis, but they do not exactly check, due to the fact that, as I have explained, proration enters into the problem as well as deliverability.

There is also another thing that I might call your attention to there, and that is that the quantities of gas that could be taken each year could deviate from those set out, and they could, in some cases, be doubled if we had the system capacity to take the gas out.

For instance, right now, we could produce from our present development probably almost twice as much gas from the Panhandle Field as we are now, but, in order to do that, the capital expenditure required will be greater than good [fol. 5138] business practice would justify.

Trial Examiner: What would be the nature of that additional expenditure?

The Witness: That would mean at least one more 26-inch line. Well, roughly, it would mean an additional 6,000 horsepower.

Trial Examiner: What is your average unit?

The Witness: The Cost of an average—

Trial Examiner (Interposing) No, the horsepower: How many units would that mean, 6,000-horsepower?

The Witness: That would mean about five. Those are 1,300 horsepower units in the Sneed station.

Trial Examiner: That is to serve the present holdings?

The Witness: That is right. We are adding two more this year unless we cannot get them.

Mr. Culton: What would be the length of that 26-inch pipe line; how many miles?

The Witness: That would be about 109 miles, and if we would increase our rate of withdrawal from that field, it would mean that the number of years we could operate in the field would be shortened by the increased withdrawal.

By Mr. Littman:

Q. Now, Mr. Hinton, am I correct in understanding that your estimate of the production by Panhandle Eastern in the West Panhandle Field for the future years as reflected [fol. 5139] in Exhibit 131 and in Schedule 5 of Exhibit 43 is based primarily upon the data shown in Exhibit 134 and which is graphically shown by curves in Exhibit 133?

A. Primarily, that is correct.

Q. Am I correct in also stating that you have based your estimate, in large part, upon the belief that production in the Panhandle Field will proceed in the future at a decelerating rate per pound of rock pressure decline?

A. I agree with that, and say that you are correct, other than when we speak of a decelerating amount of gas for the same pressure drop, I would like to say that that does not apply to a true pressure, but applies to the pressures which are obtained from observing well head pressures.

Mr. Culton: You mean it does not apply for equilibrium pressure?

The Witness: That is what I was going to say. It does not mean that these pressures we are speaking of are true equilibrium pressures.

Therefore, there will not be a greater amount of pressure drop for the same amount of production based on true and accurate pressures, but the pressure which we will observe at the well head will indicate that that is what is happening.

By Mr. Littman:

Q. And the rate of pressure drop which you applied, substantially, is that which is reflected in the chart which [fol. 5140] has been identified as Exhibit 135?

A. Yes, sir. I do not see how we could use or disregard the use of anything that establishes a constant in this field that is proven by actual field performance.

Q. So that your answer to my question is, "yes"?

A. In short form, that is it, yes.

Q. Now, if the rate of pressure drop shown in Exhibit 135 is incorrect and if the curves which appear in Exhibit 133 are incorrect and in error, then, to that extent, your total estimate would be in error. Is that correct?

A. No chain is stronger that the weakest link.

Q. And that is another way of saying that you would have to revise your entire estimate of gas produced as shown in Exhibit 131 and in Schedule 5 of Exhibit 43 if the conclusions which are reflected in Exhibits 135, 133 and 134 are found to be substantially in error?

A. Yes, and I would be most happy if they are found to be in error and that can be lengthened.

Q. And that can be what?

A. And the life of the field can be lengthened.

Q. And does the same answer go with respect to your estimate of capital additions?

A. No, that does not go for capital additions.

* * * * * * * * *

[fol. 5141] Mr. Littman: Well, I will confine my question purely to the five years, and I mean nothing more than the five-year estimate of capital additions which you have submitted in Exhibit 42.

The Witness: There would have to be an extremely high percentage or error to change the required capital expenditure in any great amount.

Q. Now, let's go back to Exhibit No. 134, Mr. Hinton. Do you have copies before you of it?

A. I have it now.

Q. According to your Exhibit No. 134, what remaining life is indicated for the Panhandle Field?

A. The remaining life of the Panhandle Field is not indicated.

Q. What conclusions with respect to the remaining life of the Panhandle Field would you draw from Exhibit 134?

A. I would draw the conclusion that, as indicated, there will be a drop-off in the total amount of gas that [fol. 5142] will be withdrawn from the field, and many of the major pipe lines will probably cease to take gas from that field when the pressure gets low enough that it is no longer economical to install the required horsepower to take loads out in sufficient volumes to meet their market requirements, but after that period, gas will be produced from the Panhandle Field for a period of many years for local markets and local consumption.

Q. I take it that you include Panhandle Eastern in the category of the pipe line companies which will have to cease operations, along about the period which you have described?

A. I do.

Q. That is, earlier than for those who serve the local markets? A. Yes, sir.

Q. Well, to be more specific, let's look at Condition "C" which is reflected in the last three columns on the right-hand side of Exhibit No. 134.

I note that in 1955, according to this exhibit, 18,165,000,000 M.c.f. will have been withdrawn under the Condition which you have described as Condition "C". Is that correct? A. That is correct.

Q. And the remaining rock pressure in the Panhandle Field will be 70.17 pounds, is that correct?

A. The same type of rock pressure as we have been [fol. 5143] referring to, throughout.

Q. And, in 1956, the total estimated cumulative withdrawal for the Panhandle Field is 18,786,000,000 odd M.c.f., and the remaining rock pressure, according to this exhibit, is 50.15 pounds. Is that right?

A. That is correct.

Q. Now, would you expect any of the major pipe line companies to operate in the Panhandle Field under Condition "C" after 1957?

A. If there is some manufacturer who can produce a type of compressor that can be operated for substantially less money than is required to operate the common type of compressor now used, it is possible that they might go slightly below that pressure, but it is not probable.

Q. In other words, in all probabilities, according to your testimony, the major pipe line companies, including the Panhandle Eastern Company, operating in the Panhandle Field, will have to pull up stakes and go out of the business of producing gas in the Panhandle Field at the end of 1956?

A. That would be my idea of being very close to the time that that will occur.

Q. You do not think that Panhandle Eastern is going to stay in the field any longer than any of the other natural gas pipe line companies?

A. No, I think Panhandle Eastern will probably leave [fol. 5144] the field before even some of the other major pipe line companies, due to the fact that this company has had foresight to create for themselves a reserve in fields where the withdrawal has been very slight to date and, for that reason, they can move their production from the Panhandle Field and go to the Hugoton Field located in Kansas, Texas and Oklahoma, and develop acreage and produce gas for less money than would be required to produce gas in the Panhandle Field at the pressures which will be encountered in the year 1956.

Q. Now, you would expect the life of Panhandle Eastern's reserves to be as long as those of the reserves of the field, would you not?

Mr. Culton: You mean the average reserves, or the average of everybody in the field?

Mr. Littman: Do you understand my question?

The Witness: I do not believe I understand. I was a little confused in thought. Do you mean the average reserve of the entire field, or the average reserve of the companies operating in the vicinity in which we operate?

By Mr. Littman:

Q. You do not expect Panhandle Eastern to exhaust its reserves in the Panhandle Field ahead of any of the other pipe line companies, do you?

A. No, I do not.

Q. Now, will you name the figure which you consider to [fol. 5145] be the recoverable gas reserves in the Panhandle Field?

A. To name that figure, it would be necessary to take each individual well because I think that the pressure at which it will be no longer be profitable to produce gas from the well is governed by individual wells, and any figure that would be named would not apply to the field.

In other words, there are going to be some wells that will be abandoned at extremely high pressures. I look for that to occur in Area "D", and I also expect some wells to produce at a profitable rate down to very low pressures, even some below 50 pounds.

Q. Well, looking at Column 12 in Exhibit 134, what would you say would be the maximum amount of gas that would be recovered from the Panhandle Field from the beginning down to the end?

A. Somewhere between 20 and 21 trillion feet of gas but that is without time limit.

Q. Now, the 20 billion M.c.f. figure appears in Column 12 in the year 1958, and indicates a remaining rock pressure of 8.83 pounds.

A. And again, we are considering the same type of pressures that have been considered all the way through.

Mr. Culton: That is, average pressure?

The Witness: That is average pressures, without consideration to the vertical thickness of pay.

[fol. 5146] Here is what happens when the pressure gets that low, Mr. Littman, and that is, the rate of travel of that gas through the formation is very slow, just applying the ratio of the difference of squares, but it is also

slowed again by the fact that it has deposited a great deal of moisture within that formation.

Now, we know that is going to happen, and the permeability channels have been cut down and, therefore, there will be areas of a great deal higher pressure than the 8.83 which will be observed at the well head, but the time element must be taken into consideration for that gas to flow into the well bore.

By Mr. Littman:

Q. Do you say that the average abandonment pressure in the Panhandle Field will be in the vicinity of 8 pounds? A. No.

Q. It would have to be, for you to get out more than 20 billion M.c.f., would it not?

A. You are not keeping in mind we are speaking of pressures at the well bore and not the pressure which would be encountered between well bores if a new well would be drilled when the actual observed pressure of 8 pounds is observed.

Mr. Culton: In other words, there will be a gradient all over the field, is that correct?

The Witness: That is correct.

[fol. 5147] By Mr. Littman:

Q. But the column is headed, "Estimated pressure decline, pounds, Condition No. 3, well head gage."

A. Yes.

Q. I thought that meant at the well head.

A. It is correctly titled, and the pressures of which I am speaking are well head pressures.

Q. Then you put the total recoverable reserves of the Panhandle Field from the beginning to the end at approximately 20 billion M.c.f.?

A. I would say that it will probably run between 20 and 21 billion M.c.f., and it will never exactly be known because we do not know how much gas was produced prior to 1935 from the sweet gas formation.

Mr. Culton: In other words, nobody ever will know what the answer ought to be?

The Witness: No, sir.

Mr. Culton: After it is all over?

The Witness: No, sir.

By Mr. Littman:

Q. However, the best estimates of the amount of gas withdrawn from the beginning of production in the Panhandle Field through the year 1940 is the figure which you show in Exhibit No. 134, Column 12, of 8,325,985,000 M. c.f. Is that right?

[fol. 5148] A. That is right, except you said, "—985,000 M.c.f.," and that should be "—985,000 M.c.f." I mean, that would be three too many zeroes on to that figure.

Q. Well, is it a figure of 8 billion M.c.f., isn't it?

A. Yes.

Q. I was right, in the first place, wasn't it?

A. No, you said 985,000 M.c.f.

Q. I still think I am right. Your figure—

A. (Interposing) I just want to be sure.

Mr. Culton: There is no question about what the correct interpretation of it is.

The Witness: I was just trying to keep the three zeroes out of the record, that is what I was trying to do.

Mr. Wheat: May we have the precise amount of the figure in the record. Let's state it another way to be sure the record is correct.

The figure is 8,325,985,000,000 cubic feet, is that correct?

The Witness: That is correct.

Mr. Littman, you were correct in the first, because I neglected to note that there were two "M's" heading that column.

Mr. Littman: I thought that was the trouble.

By Mr. Littman:

Q. Now, what would be, according to Exhibit No. 134, the remaining probable gas reserves as of December 31, [fol. 5149] 1940, according to your Condition "C"?

A. If the total recoverable reserve from the Panhandle Field should be 20 trillion cubic feet, the remaining re-

serve would be 11 trillion 674 billion 15 million cubic feet, and if the recoverable reserve from the Panhandle Field should be 24 trillion cubic feet, the remaining reserve would be 12 trillion 674 billion 15 million cubic feet.

Q. So that, according to your Exhibit No. 134, the recoverable gas reserves remaining in the Panhandle Field, as of the end of the year 1940, is between 11 and 12 trillion cubic feet?

A. That would be my idea, yes, sir.

Q. Have you heard of an engineer by the name of Ralph E. Davis? A. Yes.

Q. Do you consider him an eminent authority on the subject of estimated gas reserves?

A. I think Mr. Davis enjoys a very nice reputation as a geologist and engineer.

Q. Did you hear him testify in these proceedings?

A. No, sir, I did not.

Q. Now, Mr. Davis, in Exhibit No. 76, Page 1, in this proceeding, makes the following statement in a letter dated November 12, 1940, addressed to the Board of Directors of the Panhandle Eastern Pipe Line Company:

[fol. 5150] "Our most recent study of the Amarillo Field indicates that the proven gas acreage covers an area of approximately 1,478,000 acres and that the recoverable gas reserves, as of September 30, 1940, are not less than 17 trillion cubic feet."

Bearing in mind that the 17 trillion cubic feet estimate of Mr. Davis was made within three months of the December 31, 1940, figure which you have just given, I will ask you whether it is your testimony that Mr. Davis is right or wrong in making that statement?

. . . . . .

[fol. 5154] A. I think that Mr. Davis probably used the best knowledge he had of the field, but I do not think he knows as much about the Panhandle Field as I do.

Q. How much higher is Mr. Davis than you in the estimate?

A. I do not know what his estimate is. I have seen it in reports on the acreage owned by Panhandle Eastern.

. . . . . .

[fol. 5153] Q. Assuming that Mr. Davis' estimate of remaining recoverable reserves of 17 trillion cubic feet, as of September 30, 1940, is correct, what would be the remaining recoverable gas reserves in the Panhandle Field as of December 31, 1956, if there were withdrawn the amount of gas estimated by you under Condition "C", Column 12 in Exhibit 134?

A. There would be a remaining reserve, if it is assumed that Mr. Davis's 17 trillion cubic feet of remaining reserve as of September 30, 1940, is correct, of 6 trillion, 539 billion cubic feet.

Q. Remaining as of December 31, 1956? Is that right?

A. That is correct.

Q. And what would be the remaining reserves according to your estimate?

A. There would be a remaining reserve of 2 trillion, 213 billion, 15 million cubic feet.

Q. Now, is the last figure based on—

A. (Interposing) That is based on a total of 21 trillion cubic feet. If that would be based on 20 trillion cubic feet, it would be 1 trillion, 213 billion, 15 million cubic feet.

Q. And it has been your testimony that the total recoverable figure would be between 20 trillion and 21 trillion cubic feet, is that correct?

[fol. 5154] A. That is correct.

Q. Now Mr. Hinton, I would like to have you refer to the table on Page 10 of your Exhibit 42.

Mr. Culton: Before you get off of that Davis matter, Mr. Davis estimated how much in the Panhandle Field reserves belonged to Panhandle Eastern?

. . . . . .

The Witness: Not less than 750 billion cubic feet.

Mr. Culton: And how much do you anticipate from your study that Panhandle Eastern will be able to produce from its reserves by the time you think that they will probably have to abandon Panhandle Field? Do you recall what that is?

The Witness: No, but I think it is in excess of the amount that Mr. Davis has set out.

Mr. Culton: If it is below that, it is not very substantially below it, is it?

The Witness: No, it is that much.

Mr. Littman: I think it is below.

Mr. Culton: You think it is slightly below? Let's get the figure.

* * * * * * * *

The Witness: Yes, it is below that.

[fol. 5155] Mr. Culton: What is your total?

The Witness: My total is 718 billion cubic feet.

By Mr. Littman:

Q. How do you secure that total, Mr. Hinton? Would you mind telling us the breakdown of the figure?

A. By just merely adding the amounts that we expect to produce from the field through the years 1941 to 1960.

Q. And what is the figure that you just gave?

A. 718 billion cubic feet.

Mr. Culton: And what is the production for the preceding calendar year, say, from August to August in Texas?

The Witness: From our reserves?

Mr. Culton: Yes, approximately.

The Witness: You say, from August?

Mr. Culton: Starting with September the 1st, and ending with July 1st, September 1940 to July 1, 1941.

The Witness: You couldn't make that October, could you?

Mr. Culton: That would be close enough.

The Witness: I have the October report here, handy.

Mr. Culton: All right.

The Witness: That was 40,013,670,000 M. c. f.

Mr. Culton: And that added to 718 billion, as of a year ago? In other words, Panhandle Eastern has been

producing approximately 40 billion a year for the last year or so from the Panhandle Field?

[fol. 5156] The Witness: Just for the last year, yes.

By Mr. Littman:

Q. Just a minute, Mr. Hinton. You have been going through the year 1960 for Panhandle Eastern figures, haven't you?

A. Yes, because I had them added. There would be a deduction of 14 billion from that, making a total of 704 billion cubic feet that we would expect to produce through the year 1956.

Mr. Culton: Then, to get it back to last year, you would add another 40 on, approximately? You would start from October of last year?

The Witness: Yes, that is right, because this letter was written in 1940. I thought it was 1941. I didn't notice the date there very closely.

That is correct. That would be a total of 744 billion cubic feet.

By Mr. Littman:

Q. From when to when?

A. From November 1940 to December 31, 1956.

Trial Examiner: Before you reply to Mr. Littman's question concerning the table on Page 10 of Exhibit 42, please supply a bit of additional information concerning your factors which have resulted in the conclusions you have stated in the testimony today and yesterday.

[fol. 5157] I believe on the letter of Mr. Davis, to which you have just referred and which is shown in the document marked for identification as "Exhibit 107"; the present Panhandle acreage, including leases, comprises 4.43 per cent of the total proven area of the Amarillo Field.

I have just read that phrase from that letter of Mr. Davis.

The Witness: Yes, I check it here on this letter.

Trial Examiner: May I ask whether, in your studies, you have confined your estimates entirely to the produc-

tion of the acreage which is now owned or under lease from the company?

I should say, now producing for the company, either under gas purchase contracts or under royalties.

The Witness: Yes, just on the acreage now held by either development, delay rental or gas purchase contracts.

Trial Examiner: And you have measured the predictions of consumption by your company in the expanding market by the present estimated rate of increase, have you not?

Your predictions of future years are based on your expectations?

The Witness: Yes.

Trial Examiner: And those expectations are based on your experience since the company began to operate?

The Witness: That is correct, yes, sir, and Mr. Morton's forecasts.

Trial Examiner: And in making that estimate you have [fol. 5158] had, of course, close access to all of the company's records showing its growth?

The Witness: Yes.

Trial Examiner: Have you had similar access to the records showing the growth of the other companies taking from this same area?

The Witness: Yes, I have.

Trial Examiner: And have you made similar calculations with reference to their future expectations?

The Witness: Yes, I have.

Trial Examiner: Have you taken into account the factors which will result in an ultimate saturated market in the territories they now serve?

The Witness: All with the exception of Cities Service, which seems to stay along at about the same rate of withdrawal year after year for the markets which they serve from the Panhandle Field.

The increase in withdrawal from that field will be principally by Panhandle Eastern Company, the Texhoma Natural Gas Company, which produces for the Natural Gas Pipe Line Company of America, and the Northern Natural Gas Company serving Nebraska and Minnesota.

Trial Examiner: Are the markets which are served by the companies serving the other 95 percent, or taking the other 95 percent, in your judgment, as stable as the market [fol. 5159] which your company serves?

The Witness: Yes, probably more stable, because we serve an industrial area and much of the gas which is taken into Kansas City, through the Cities Service line, is house heating and firm load gas.

The gas which is taken by the Northern Natural will not serve as large a percent or as high a number of industrial customers as the Panhandle Eastern will probably serve in the area which they serve.

Mr. Culton: You haven't mentioned Canadian River. What recognition do you give to Canadian River and the Denver Line?

The Witness: The Denver Line contemplates a pick up in their load, but not in the proportions that the companies already mentioned contemplate.

However, the Canadian River acreage furnishes one-fourth of the load for the Natural Gas Pipe Line Company of America and, therefore, that acreage will participate in the market increase for the Natural Gas Pipe Line Company of America.

Trial Examiner: In making these compilations, has it been necessary for you to consider the future of the carbon black industry?

The Witness: Yes.

Trial Examiner: And the casing head-gasoline process?

The Witness: That is right. By studying the monthly [fol. 5160] report. We get a monthly gasoline plant report from the Railroad Commission.

Trial Examiner: And your present estimates of the future are based on the continuance of present practice?

The Witness: That is correct. I do not look for any large expansion in the carbon black industry in the Panhandle Field.

By Mr. Littman:

Q. And your Condition "C", as reflected in Columns 11, 12 and 13 in Exhibit 134, reflects the increased take by all parties, including Panhandle Eastern, from the Panhandle Field in the future years, does it not?

A. That is correct, yes.

Q. Now, if you had adopted and used Mr. Davis' 17 trillion recoverable reserves as of September 30, 1940, you would show a field with a longer life, would you not?

A. Yes, if I would adopt them.

Q. And you would have to revise your own estimate of the recovery to be secured by Panhandle Eastern in the light of that longer life and in the light of those total overall reserves, is that correct?

A. That is right. Or, if we would assume there was a remaining reserve of 50 trillion instead of Mr. Davis' 17 trillion, why, the life of our company could be extended a great many more years.

[fol. 5161] Q. So that you and Mr. Davis cannot both be right, is that right? A. That is right.

Mr. Lee: What is right, you are right, or he is right?

The Witness: No, that both of us cannot be right.

By Mr. Littman:

Q. Now, in other words, you fully expect that Panhandle Eastern will be operating in this field as long as the other pipe line companies operate?

A. That is right, and I hope Mr. Davis is right and I am absolutely wrong, but I don't think he is, because every time that he makes an additional reserve estimate for our company he obtains more information.

If you will trace those down, I think you will find that they are at a declining rate, that the original amount that he set up for this field was greater than the amount which he estimated in his last reserve figure.

That is because he is finding out more about the field. He has been sending a man out on these reports who has been obtaining a great deal of the detail that makes up the

information necessary to make an accurate reserve estimate of this field.

Q. Well, you know, do you not, Mr. Hinton, that Panhandle Eastern has used Mr. Davis' estimate as recently as in 1941 for the purpose of proceedings before the Securi-[fol. 5162] ties and Exchange Commission for the purpose of floating security issues, do you not?

A. I don't know what they were floating, but I do know that he has made this reserve estimate for our company because I am called on to check the number of acres in most cases when that reserve report is made, to see that he has taken into consideration the correct number of acres.

Q. Were you called upon [the] check Mr. Davis' estimate which was used before the Securities and Exchange Commission, which is the same one which I just read to you a minute ago?

Mr. Culton: Just a minute. I think counsel is wrong on that. I don't think he has offered it. You said that you just read it to him. You didn't offer him this year's report.

The Witness: That was 1940, the one that you handed me.

Mr. Culton: We tender to you Mr. Davis' last one, if you wish to put it in evidence and inquire about it. I think a copy of it has already been handed to counsel early this week.

Mr. Chamberlain: Isn't that Exhibit 107?

Mr. Littman: No, this is not an exhibit in this case.

Mr. Culton: Part of it was offered as an exhibit the other day by counsel.

Trial Examiner: A reference was made to it.

Mr. Littman: Not by me. I think it was by other counsel.

At any rate, I have not read it, but I shall read it at the [fol. 5163] first opportunity.

Trial Examiner: Just one further question, if I may ask it. What consideration did you give to waste and conservation in connection with your predictions?

The Witness: That is a pretty hard figure to make an accurate estimate of. In order to try to obtain a better knowledge of the amount of gas that is being wasted, we have adopted the policy of keeping a well-blowing record and we know how long each well is open to the atmosphere each year and we know how much gas has been tested, and we have talked to the other companies, I have, their operators in the field.

I know about what their policies are about blowing wells and we have included a figure in this amount given for gas wasted to the air.

Trial Examiner: That is a large factor, is it not, in your predictions?

The Witness: No, it is quite small. That runs only from 12 billion to 15 billion a year.

Trial Examiner: When you say that that is quite small, you mean you estimate the loss of gas from field operations and waste to equal 18 billion or 20 billion cubic feet a year?

The Witness: Twelve billion to 15 billion cubic feet a year. That includes gas that is blown to the air during the time that the wells are being drilled into the producing formation.

[fol. 5164] Trial Examiner: You have no very satisfactory data, have you, as a basis for such an estimate?

The Witness: No, sir.

Trial Examiner: So that that is purely a judgment estimate?

The Witness: Yes. The application of judgment to what data we can gather.

By Mr. Littman:

Q. A moment ago I asked [to] to turn to the table on Page 10 of Exhibit 42. Am I correct in understanding that the rate of rock pressure decline utilized by you in making your estimate was derived from the figures in this table?

A. Yes.

Q. And I believe yesterday you explained how the five points were plotted on the chart, Exhibit No. 135, from the five lines of data shown in this table?

A. Yes, I think we went through that quite thoroughly.

Q. Did you make any personal investigation with respect to any of the figures shown in this table?

A. What do you mean by "a personal investigation"?

Q. Well, did you work these figures up yourself, or did you secure them from certain sources?

A. Why, naturally, I secured them from certain sources and they were worked previous to the time that I worked them, and I checked them.

Q. Now, will you give us the source of the figures [fol. 5165] shown in this table, column by column?

A. The periods shown cover production figures which were compiled by various producers in the Panhandle Field and were taken from the records of the Railroad Commission and converted from 14.65 to 16.4.

Q. What part of these figures, shown in the column headed "Production, M. c. f.", was taken from the reports of the Texas Commission and what part of them from other sources that you generally described?

A. I was looking for that set of figures yesterday, and I thought they would be on Mr. Smith's working papers, but they were not. I haven't located them yet, but they include an amount of gas blown to air by drilling-in, well maintenance, and the set of figures were typed and in the office of the Texhoma Natural Gas Company, I believe.

It might have been in the offices of the Columbia Fuel. They were secured by our representative, who lives in Amarillo, for me.

Q. Well, can you give us the breakdown of these figures in Column "Production, M. c. f."?

A. You mean as to what portion of that gas was used for light and fuel and what portion for carbon black and what portion went to gasoline plants?

Q. No, I mean what portion of these figures were taken from the Railroad Commission of Texas reports.

[fol. 5166] A. The metered gas?

Q. Well, can you give us the amount?

A. To give you the amount, why, we would have to divide it up into light and fuel, casing head, gasoline plant use, and then the estimate of gas blown to air in lease use.

Q. Well, perhaps we can get at it in that way, then. If you can supply the breakdown, perhaps it would clear up my question.

A. Do you question the accuracy of those figures?

Q. I am merely asking about the source, Mr. Hinton. You see, these figures do not coincide in total with the figures shown in the Texas Commission reports.

A. And they will not.

Q. And I wanted to know why and I wanted you to explain for purposes of the record how you arrived at it.

A. They are on a different pressure base, which accounts for one of the reasons that they will not check with the Railroad Commission records.

The second is that the operators in the Panhandle Field have compiled a set of data showing the amount of gas estimated to be blown to the air.

Mr. Peterson, of the Texhoma Natural Gas Company, has furnished that figure that is included in those figures there on Page 10 of Exhibit 42.

[fol. 5167] Q. Suppose you read the breakdown into the record.

A. I am still looking. I don't seem to be able to locate them, however, it will be a pleasure to furnish the breakdown to you at a later date, if you think it would save time, rather than my looking right now.

That was one of the early things that was done in the working of this problem.

Q. Do you suspect that you have the breakdown of these figures in your working papers before you?

A. I suspect that I do.

Q. Well, let's pass that for the moment and see if you can find them a little later. While you are looking for those papers, can you state whether they include casing head gas?

A. They do include casing head gas.

Q. For the entire period?

A. Yes. Of course, you understand that they probably don't include all of the gas from the sweet field because, as I have said before, in the early days the amounts of gas that were produced could only be estimated and the amount shown in total may be in error.

Mr. Culton: That is the August 1, 1935, item, from the beginning, August 1, 1935?

The Witness: Yes.

By Mr. Littman:

Q. Do these figures include all of the dry gas and all [fol. 5168] of the casing head gas reported by the Railroad Commission?

A. Yes, and an estimate for all gas other than lease use previous to August 1, 1935.

A copy of Mr. Peterson's figures is on an 8½ by 11 photostat and the breakdown is shown on that. I copied it from that to my records after talking to Mr. Peterson and Mr. Cotner, and I feel that the amounts of gas shown there are as nearly correct as it is possible to get them.

Q. Did you also talk to Mr. Massa, who was formerly employed by the Railroad Commission, about that figure?

A. Yes, I did. Mr. Massa has helped me considerably in obtaining data from the records of the Railroad Commission concerning withdrawals.

Q. Well, a good part of these figures is estimated, is that right? A. No, not a good part.

Q. Well, how much of it is estimate rather than metered?

A. Oh, I would say that there is probably somewhere around from 15 to 25 percent estimated in that amount.

Mr. Culton: Is that just in the first amount?

The Witness: Yes, that is just in the amount up to August 1, 1935.

By Mr. Littman:

Q. Is it your testimony that only 15 percent, approximately 15 percent of the 5,197,000,000 figure shown in the [fol. 5169] first line, is estimated?

A. I said from 15 to 25 percent. I am basing that from memory, because I compiled a great many figures during the time that the Committee for Conservation of Natural Gas was [function] in the Panhandle Field.

That was in 1933 and 1934. I am just trying to remember just what amount it was, but I believe somewhere between 15 and 25 percent would be correct.

It is not true that the gas was not metered before the Railroad Commission started keeping records. It was measured, naturally, because royalty had to be paid upon that gas. It was only the gas that was used for gasoline plant use that was not accurately metered.

The production to pipe lines and a great deal of the gasoline plant production was metered, but they sprang up so fast and without jurisdiction that, naturally, there were errors in the amounts estimated.

At the present time there is somewhere around one to two percent of the total withdrawal that is estimated.

Q. Well, can you tell us approximately what percentage of these production figures was obtained from sources other than the Texas Railroad Commission reports?

A. I believe that it would be safe to say that, at least, 95 percent of all figures that are shown in Column 2, Page 10, Exhibit 42, will check with the records of the Railroad [fol. 5179] Commission if they are converted to the same pressure base.

Mr. Culton: That is following August 1, 1935?

The Witness: Yes, that is right.

By Mr. Littman:

Q. Now, you refer in your first column to beginning at August 1, 1935. What is the date of beginning?

A. The first gas produced in commercial quantities was somewhat prior to 1926. That was in small amounts.

Q. So that you have approximately a ten-year period in your first line? A. Yes.

Q. Now, in the second line you have a period of 11 months, do you not? A. That is right.

Q. In the third line you have a period of 12 months?

A. That is right.

Q. In the fourth line, a period of 13 months? A. 13.

Q. And in the last line, a period of 24 months?

A. That is correct.

Q. Now, why do you split these data into such different and varying time periods?

A. By trying to arrive at a time that more nearly represents the middle of the period during which the pressures were observed.

[fol. 5171] The reason that the production through 1939 is included in that shown from 8-1-38 to 8-1-40, is due to the fact that the Railroad Commission in that year had included a number of acres which turned out to be in error.

They had weighted their pressure with that acreage and it gave a very decidedly erroneous picture, and for that reason it could not be used in here, because it would give us a result which would be in error, naturally.

Q. How did you eliminate that error?

A. By taking out that acreage the next year. The Railroad Commission found out what they had done. It was merely done by placing the isobar line on the pressure map prepared by the Railroad Commission.

After the adjustment was made, the pressures came back to their naturaf trend.

Mr. Culton: The Commission itself recognized that error in its next pressure map?

The Witness: That is right.

By Mr. Littman:

Q. Well, what pressure loss in pounds did the Texas Railroad Commission find for the period August 1938 to August 1939? A. May I see your 1939 report?

Trial Examiner: It is right here, if you would like to use this.

[fol. 5172] The Witness: Thank you.

Now, you want to know what the pressure was for the year 1939?

Mr. Littman: Yes.

The Witness: I am reading from the 1939 report published by the Railroad Commission, Page 2, under the paragraph headed, "Total Field."

The weighted average pressure of the entire field in July 1939 was 323.72 pounds per square inch as compared with an average pressure of 337.66 pounds in July 1938.

By Mr. Littman:

Q. Now, what pressure loss is indicated?

A. 13.94 pounds.

Q. Now, you didn't use that figure? A. No, sir.

Q. All right. If you had shown the year, 1938 to 1939, separately, in one of the lines on Page 10 in Exhibit 42, you would have had in Column 3, "Pressure Loss Pounds" the figure of 13.94, would you not? A. Yes.

Q. And what comparable figure would you have had for the year 1939 to 1940?

A. I am reading from Page No. 5 of the 1940 Report published by the Railroad Commission of Texas:

"The weighted average pressure of the entire Panhandle [fol. 5173] Field in July, 1940 was 318.33 pounds per square inch as compared with an average pressure of 323.72 pounds in July 1939, during which period a total of 564,285,297 M.c.f. of dry gas was produced with a corresponding pressure drop of 5.39 pounds per square inch."

Q. The corresponding figure in Column 3, "Pressure Loss, Pounds" for the period 1939 to 1940 would have been 5.39 pounds, is that right?

A. That is right. The total of the two years add up to 19.33 pounds, instead of the 19.35 shown for the same two-year period in Column 3, Page 10, Exhibit 42.

Mr. Culton: While you are on it, will you see if there is any difference in the increase in acreage used in 1940 from that used in 1939? You will probably find that in connection with the East Field in 1940.

The Witness: It will show on the total field, also.

Trial Examiner: A 10,000-acre increase?

The Witness: Yes, they added 10,000 acres of high pressure in 1940, which changed the picture.

By Mr. Littman:

Q. Well now, were these two figures which you just mentioned of 13.94 pounds of pressure loss for the year 1938 to 1939, and 5.39 pounds for the year 1939 to 1940, both erroneous, or what? A. No.

[fol. 5174] Q. They were both all right?

A. No, it is, as I said, the 1939 figure which was in error, and it was straightened out in the year of 1940.

Q. Now, you say the 5.39-pound figure is wrong?

A. Yes, sir. It is wrong. So is the 13.94-pound figure. Added together, they will be correct.

Q. Well, isn't this situation typical of the inaccuracies which are bound to creep into these determinations of pressures, rock pressures, for the various years?

A. You say are they not what?

Q. Are typical.

Will you read the question back, please?

(Whereupon, the question indicated was read by the reporter.)

The Witness: No, I would say they are far from typical. The Railroad Commission of Texas has a tremendous job upon their hands and they do it in very good shape.

It just so happened that this one year they did draw the pressure isobar at the wrong place and after they found out that they had made this error, they came back and corrected it the next year.

By Mr. Littman:

Q. Now, will you read from any report of the Railroad Commission of Texas where the Commission has stated that it had been in error in computing the rock pressures [fol. 5175] for that year, for 1940? A. They weren't in error in 1940.

Q. Well, 1939 to 1940.

A. I doubt if they published it, but if you want to have me show the different number of acres weighted with the various pressures, it can readily be shown.

Q. Well, has the Texas Commission ever stated that they have made an error in the determination of their 1939 to 1940 rock pressures?

A. No, here is what happened: Somebody got the idea that there was a group of unproven acreage that belonged in one pressure class and so they placed it in that pressure class.

Then, a well was drilled and the pressure proved that the man who thought that bunch of acreage should have been in that class was wrong, so the next year it was placed back in between the pressure bands, where it should have been. The drilling is what straightened it out.

Q. I hand you a copy of the 1940 Report of the Railroad Commission of Texas and ask you to read where marked in the first paragraph of Page 5, and I ask you whether that statement will refresh your recollection of the situation.

Mr. Culton: You are talking about something entirely different from that.

Mr. Littman: That is what we want to find out. We want to be straightened out if we misunderstand, and I am sure this witness wants to be straightened out, if he mis-
[fol. 5176] understands.

The Witness: Yes, I think that describes it. Would you like me to read it?

By Mr. Littman:

Q. I wish you would, please.

A. (Reading) "The weighted average pressure of the East Field in July 1940 was 247.68 pounds per square inch as compared with an average pressure of 242.34 pounds in July 1939. The reason for this pressure increase of 5.34 pounds was two-fold: First, the area of the East Field was increased by approximately 10,000 acres including a new well, the McLean Gas Company's C. H. Biegel No. 1 in Section 63, Block 23, H. & G. N. Survey, Gray County, which has a rock pressure over 400 pounds; second, an area of approximately 20,000 acres which, heretofore, had no control, was carried in the 250 to 300 pound contour, was proven to have a pressure over 300 pounds by the drilling in by Lone Star Gas of their J. A. Fowler wells No. 1 and 2 in Section 118, Block 23, H. & G. N. Survey, Gray County.

"From July 1939 to July 1940 a total of 39,567,071 M.c.f. of sweet gas was produced and a total of 24,476,412 M.c.f. of casing head gas.

"The daily average production for the East Field during this period was 18,380 M.c.f. of sweet and 66,875 M.c.f. of casing head gas.

[fol. 5177] "At the time of this survey there were 397 wells in the East Field having a total potential of 4,582,458 M.c.f., daily, and producing from a total area of 281,588 acres."

Q. That paragraph refers to the East Field, does it not? A. Yes.

Now, then, if you want to see what actually happened, I suggest that we get the 1941 rock pressure.

Mr. Culton: 1940.

The Witness: 1941 data; and see what the pressure on these wells, the one that came in at over 400 pounds, is at this time.

By Mr. Littman:

Q. I wouldn't care to go into that at this time.

Mr. Culton: May I call attention to the fact that this shows, does it not, that the pressure in the East Field in July 1940 was 247 pounds, or over 5 pounds more than it was the year before, and yet during that period 39 million M.c.f. or 39 billion feet of sweet gas was produced and 24 billion feet of casing head gas produced and yet the pressure is up 5½ pounds.

Is that correct? From the statement you just read?

The Witness: 5.34 pounds.

Mr. Culton: Yes.

By Mr. Littman:

[fol. 3178] Q. Now, you consider these figures of pressure loss in pounds shown in the table on Page 10, to be as you testified yesterday, accurate within one pound, up or down, is that correct?

A. That would cover the situation, yes, sir.

Q. And that applies to all of the figures shown on Page 10 in the column headed, "Pressure Loss, Pounds"?

A. Yes; and by giving one pound, I think that we are giving plenty of leeway.

Q. Now, Mr. Hinton, am I correct in understanding that you disregarded the first line embracing the period from beginning to August 1, 1935, for purposes of determining the rate of pressure drop as shown in Exhibit 135?

A. Yes, I did.

Q. And did use the data shown in the table on Page 10 in the lower four lines embraced in the period from August 1, 1935, to August 1, 1940?

A. Yes, sir, that is correct.

Q. And you plotted your line in the chart, Exhibit 135, then, from four points, each one of which was derived from each of the four bottom lines, is that right, as you explained yesterday?

A. Yes, but I didn't quite get what you meant when you said, the bottom line.

Q. I meant the bottom four lines on Page 10.

[fol. 5179] A. Yes.

Q. Mr. Hinton, assuming that the production per pound of rock pressure decline had remained constant from August 1, 1935, to August 1, 1940, what would be the average rock pressure loss in pounds per trillion cubic feet, and the corresponding rock pressure loss in pounds for each of the four periods shown in your table on Page 10?

I understand that will require a calculation of approximately five minutes. I would like very much to have that calculation made.

A. I think I have already made it. I will check it. I believe it is 15.54. The total amount of production from 8-1.

Q. August 1?

A. No, I left out the estimated production there because that point was not used. It is from 7-1—from 8-1-35 to 8-1-40. It was 2,884,110,974. The total pressure drop for that period was 44.20 pounds. That gave an average of 15.33 pounds drop per trillion.

Q. Now, I also called for another set of figures which you apparently have not yet calculated.

I would like now to have the corresponding rock pressure loss in pounds for each of the four periods shown in this table. In other words, I would like to know what comparable "pressure loss, pounds" figure you would have [fol. 5186] in the third column for each of those four periods, assuming that the production per pound of rock pressure decline remained constant from August 1, 1935, to August 1, 1940.

Mr. Culton: At what point? I can't understand it.

The Witness: I don't understand your question.

Mr. Culton: Constant at what point the point shown on August 1, 1935?

By Mr. Littman:

Q. Assuming that there has been uniform production per pound drop of rock pressure throughout this period, this entire period August 1, 1935, to August 1, 1940.

A. If I get your question right, you want me to apply the rate of withdrawals for the year from July 1, 1936, to July 1, 1937, and for the year commencing July 1, 1937, to August 1, 1938.

Q. That is right, for each of the periods.

A. All right.

The pressure loss for the following periods based on the rate of loss for the per trillion produced for the period commencing 8-1-35 to 7-1-36, and carried on down through the following years would give the following results:

For the period commencing 7-1-36 and extending to 7-1-37 and using a rate of decline that occurred during the previous year, the pressure loss in pounds would have been 7.46 instead of 7.95.

[fol. 5184] For the year commencing 7-1-37 to 8-1-38, and applying the same rate of decline as occurred during the year 8-1-35 to 7-1-36, the pressure loss would have been 8.41 instead of 9.39.

The application of the rate of decline which occurred from 8-1-35 to 7-1-36 to the year commencing 8-1-38 to 8-1-40 would have been 15.56 instead of 19.35.

Inasmuch as the figures originally on this page are Railroad Commission figures, I think that that readily proves that it would not be possible to carry on a constant rate of decline.

Q. Mr. Hinton, either you misunderstood me or I misunderstood you, but the figures that you have just given me are not the ones that I wanted you to calculate.

What I would like to have you calculate, as my previous question, I think, indicates it, is to apply the 15.33 rate to the production in each of the periods and give me the resultant pressure loss in pounds.

A. Yes, all right.

Q. Will you give me the first figure, so that we may make certain that you are getting what we want before you proceed with the rest of them?

A. Yes. If the average were applied over the entire period, there would have been a pressure decline for the year commencing 8-1-35 through 7-1-36 of 8.53 pounds instead of 7.51.

[fol. 5182] Q. You are getting the figures that we want. Now, will you proceed with the balance of the figures?

A. Yes, I will be glad to, because it is going to convince you, I believe, that you couldn't anyways near apply an average pressure throughout the life of this field.

Q. I rather doubt it, Mr. Hinton, but I appreciate your zeal.

A. For the year commencing 7-1-36 to 7-1-37, the pressure drop, applying the average of 15.33 to the amount of gas produced, would have been 8.45 pounds instead of the 7.98 which was obtained from the Railroad Commission pressure reports.

Applying the 15.33 to the production which was taken from the year commencing 7-1-37 through 8-1-38, the pressure drop would have been 9.55 instead of the 9.39 reflected in the data of the Railroad Commission report.

If the rate of 15.33 pounds is applied to the production which occurred for the period commencing 8-1-38 to 8-1-40, the pressure drop would have been 17.67 pounds instead of the 19.35 pounds which actually occurred.

Q. In other words, Mr. Hinton, if the production per pound of rock pressure decline had remained constant from August 1, 1935, to August 1, 1940, the corresponding loss in rock pressure would have been the pound figures which you just read into the record instead of those shown for [fol. 5183] each of the four periods shown in the bottom four lines, Column 3 of Page 10 of Exhibit 42, is that right?

A. If that would have been what the data indicated, those would have been the figures that would appear on this sheet in place of the typed figures which do appear.

Q. Now, in order to produce this constant rate of production per pound of drop in rock pressure decline, the figure of 7.51 pounds would have had to be varied slightly more than one pound upward, is that right?

A. That is correct.

Q. For the period August 1, 1935, to July 1, 1936?

A. That is right.

Q. And it would have required a variation upward from 7.95 pounds to 8.47 pounds to produce that same result for the period of July 1, 1936, to July 1, 1937, is that right?

A. That is correct.

Q. And it would have required a slight change from 9.39 pounds to 9.55 pounds to produce that result for the 13-month period, July 1, 1937, to August 1, 1938, is that correct?

A. That is correct.

Q. Now, for the last period, which embraces two whole years, from August 1, 1938, to August 1, 1940, it would have required a change downward from 19.35 pounds to 17.66 pounds, is that right?

[fol. 5184] A. That is correct.

Q. And is it not, also, correct that these new figures that you have read into the record are within the range of possibility of error and tolerance to which you alluded in your testimony today and yesterday, is that correct?

A. That is correct. However, there is always this to keep in mind, that the errors which occur in this type of work are largely compensating errors and are not errors that are multiplied.

Therefore, the type of error that will creep in one way will be counteracted by an error that will creep in the other way.

Q. But you can readily understand, can you not, Mr. Hinton, that the slightest deflection in these pressure-loss figures reported by you in the table on Page 10 might very, very well have produced and would produce a uniform production per pound drop of rock pressure in the Panhandle Field, is that right?

A. I would say that errors would influence it. They would have to be errors of greater magnitude than slight.

Q. Well, errors as slight as one pound per year, up or down, within the range of tolerance suggested by you, would produce a uniform production per pound drop of rock pressure in the Panhandle Field, is that not correct?

A. Yes, but I am not conceding, and I have not con- [fol. 5185] ceded, that there would be errors in a magnitude of greater than 5 percent.

Mr. Culton: And would you expect them all to be one way?

The Witness: No, sir.

By Mr. Littman:

Q. Well, these new figures that you read into the record are not all one way, either, are they, Mr. Hinton? Some of them vary upward from the figures that you used and one, at least one of them for the two-year period varies downward, does it not?

A. Anytime that a series of figures of that nature is taken, beginning with a low number and ending with a high and then an average is struck, naturally, when the average is applied, the commencing will be higher than the low and the ending will be lower than the high. That is very simple arithmetic.

Q. Well, regardless of the fact that, according to your testimony, there is a tolerance for error and a possibility of error, one pound either way, up or down, in these pressure-loss figures in the table on Page 10, and yet you applied those data literally in arriving at the rate of production per pound of rock pressure decline, did you not? Can you answer that yes or no?

A. Yes, I did. I will tell you why, it is because it came so close to checking.

[fol. 5186] Now, if these errors were creeping in, these points would not fall in nearly as straight a line, because the error would take it out of the realm of the straight line. That is on the curve produced on Exhibit 135.

Q. How do you know, Mr. Hinton, that the production per pound of rock pressure decline in the future in the Panhandle Field will proceed at a decelerating rate?

A. I don't know it, but past performance leads me to believe that it will.

Q. But you cannot vouch for any such thing, can you?

A. I couldn't vouch for anything in the gas field or around the gas wells, because we might have an earthquake down in that region that would shift the formation that would ruin the field overnight.

Q. But, Mr. Hinton, am I correct in stating that the experience upon which you are basing this deceleration of production for each successive pound drop of rock pressure in the Panhandle Field was taken from the literal application of the figures shown in the bottom four lines of the table on Page 10, covering a period from August 1, 1935, to August 1, 1940?

A. Yes, that data was used, and if you or anyone else can direct me to a better source of data, I would be highly appreciative.

Q. Well, if the data were accurate to the nth degree, [fol. 5187] both as to production and as to pressure loss in pounds, there is a great possibility, is there not, Mr. Hinton, that the indicated production per pound drop of rock pressure in the Panhandle Field would proceed at a uniform rate in accordance with the application of Boyle's Law? Is that not correct?

A. That is correct, but inasmuch as Boyle's Law cannot be applied, we still find that we have a uniform rate, due to the fact that the pressure points fall on a straight line.

Q. Now, assuming that the Panhandle Field is a tight container and assuming that the production and rock pressures in that field have been accurately determined from the beginning, should there be any substantial deviation from Boyle's Law of gases?

A. No.

Q. What is your answer?

A. No.

Q. And under these circumstances, the production per pound of rock pressure decline would be constant from the beginning?

In other words, there would be no acceleration or deceleration?

A. That is absolutely correct.

. . . . . .

[fol. 5188] Q. Now, what reasons, in view of your answer to my last question, do you ascribe for the purported decelerating production per pound of drop in rock pressure in the Panhandle Field as indicated by you on Page 10?

A. Two things, principally the absence of the fourth dimension in the weighting of the field and the length of

time that is required for gas to flow from areas of higher pressure to areas of lower pressure.

Q. Well, how does that affect the over-all picture? Didn't you consider the Panhandle Field as a single reservoir?

A. Yes, but not a reservoir that is entirely alike throughout its area. There are great differences in the thickness of pay in the Panhandle reservoir, and if all of the wells that have been drilled in the Panhandle Field now had been drilled on the marginal acreage and on producing formation of thin pay, the remaining amount of pressure that would be observed would be far less than the average which we do observe.

Now, it is a fact that the weighting of this acreage does not give consideration to the total thickness of pay, but gives the same value to the marginal acreage that has only a very thin pay section as that of the pay section which is many times that thickness.

Therefore, when it is just weighted with the horizontal weighting only, the picture is not correct.

[fol. 5189] Q. Well, the variation of the thickness would affect the pressure reading, would it not?

A. That is correct, and as I have said, if you would move the rate of withdrawal over to the areas of thin pay, most of them would long ago have been abandoned if they were separated from the main field.

Q. But, the variation in the pay thickness does not affect the application of Boyle's law, if the data is correct?

A. Then, I am telling you that there is a length of time required for this gas to flow from an area of one higher pressure to an area of lower pressure.

Q. But, Mr. Hinton, the data that you used, to wit, rock pressure readings, is subject to the same fallacy to which you have just alluded a moment ago, is it not?

A. That is correct. If it were not, why, then, the average pressure decline for trillion feet of gas would remain constant, but it is proven that there is a constancy existing.

Q. You mean a constancy in the error? A. Yes.

Q. And you are, in reality, banking upon the consistency of the error in these readings through the years?

A. Yes.

Q. And your estimate of a decelerating rate of production for each successive pound drop of rock pressure decline is bottomed greatly upon your banking that the errors [fol. 5190] in these rock pressure readings will continue in the future as consistently as you claim they have occurred in the past?

A. Yes. I feel that is what is going to happen, Mr. Littman, and I believe that right now that is the only one thing that you can find that will check as closely in the Panhandle Field as that data which has been plotted upon Exhibit 135.

When I make that statement, I believe that I can say that I have put in probably as many hours on this problem as anyone else that worked on the production end of a natural gas company operating in the Panhandle Field.

Q. By the way, you have what appears to be a mathematical error in your table on Page 10? Will you ascertain whether the figure which appears on the bottom line under the heading "Indicated Virgin Content (Trillion) of 24.609" is correct?

A. Yes, sir, I am .07 of one million cubic feet of gas off.

Q. What is the correct figure?

A. 59,556,524.3.

Mr. Culton: He means the 24.609. To me it looks like it is too low.

The Witness: I thought you said the production.

By Mr. Littman:

Q. I wouldn't be that technical. I was referring to the column at the extreme right-hand side. What is the correct [fol. 5191] figure? A. 25.609.

Q. Instead of 24.609? A. That is right.

Mr. Culton: That doesn't affect any of the other computations, though, does it?

The Witness: No, sir.

By Mr. Littman:

Q. Now, as you have already explained, you did not utilize any of the data for the ten-year period from 1925 or 1926 to August 1, 1935, which is shown in the first line of your table, isn't that correct? A. That is right.

Q. You threw away the ten years and used the remaining 5 years?

A. I would rather have five good years than ten bad ones, yes, sir.

Q. What is bad about it?

A. Unknown quantities.

Q. Estimates? A. Estimates.

Q. Well, weren't those estimates checked by you and investigated by you as to accuracy?

A. Right, and to the point I neglected to use them in my work there because, while I feel that they are very good [fol. 5192] estimates, they are not of sufficient accuracy to use in this type of mathematical calculation for the purpose that this has been used.

Q. Well, they are the most accurate figures that could be obtained for the ten years, are they not?

A. That is right.

Q. Well, suppose you tell us how inaccurate these figures that you show in the first line are?

A. I don't know how I could show you that.

Q. You can't possibly know how inaccurate they are, can you? A. No, sir.

Q. If at all? A. No, sir.

Q. Well, now, if you had used the data shown in the first line on the Table on Page 10, Exhibit 42, what effect would it have had upon your line on the chart, Exhibit No. 135, showing the rate of pressure drop from 1935 to 1940?

A. It would have lowered the rate of decline slightly, that is, the increasing rate of decline.

Q. In other words, this line shown in the chart, Exhibit No. 135, would have declined less and would have more closely approximated a straight line, straight horizontal line, is that right?

A. Yes, and the line would not have passed through the [fol. 5193] points of better-known data as closely as they do.

Q. Now, I note that you have plotted that point representing the end of the ten-year period on this chart, which has been designated as Exhibit 135, have you not?

A. Yes, sir.

Q. Why did you put that point at the end of the ten-year period?

A. Because that is where it belonged in reference to the total withdrawal of the field.

Q. Mr. Hinton, isn't it a fact that it would more properly belong along toward the center of the ten-year period?

A. No, I should say not. Then there would be a great error.

Q. The point that you plot here is at the end of the ten-year period, is it not? A. Yes.

Q. And your graduations along the bottom of the chart are in trillions of cubic feet, are they not?

A. That is right. That is used to express the total accumulated withdrawal from the field in trillions of cubic feet.

Q. Then, you are certain that it would not have been more proper to plot that point at the mid-point in order to give a proper weighting to the time element involved in producing the slightly in excess of 5 billion M. c. f. in the ten-year period?

[fol. 5194] A. I believe that the best way to answer that would be to call your attention to the calculation which you had me make in Column 3, Page 10 of Exhibit 42.

You will notice that by the application of an average figure that there is an error which creeps in on both ends of this series of calculations.

Q. Mr. Hinton, don't these points that you have plotted on this chart, Exhibit No. 135, represent the average pressure drop per trillion cubic feet withdrawn from the Panhandle Field?

A. The average pressure drop?

Q. Yes.

A. Yes, at the various stages of withdrawal from the entire field.

Q. And that average is calculated over a period of time, is it not?

A. Yes.

Q. And represents an average of the period of time covered by the production, is that right?

A. That is right. Each year as the weighted averages are established, the amount of pressure drop is then obtained and that, along with the total amount of gas pro-

duced will show the number of pounds required to produce a trillion feet of gas, if that rate were to continue throughout the time that a trillion feet would be produced. [fol. 5195] Q. Now, this average drop in pressure was computed by taking the average pressure over the ten-year period, was it not, for your first point shown in the chart?

A. No, sir, the first point shown on the chart that was used was the number of pounds that was required to produce a trillion feet of gas when the total withdrawal from the field had been the amount shown, of, I believe it is, 5 trillion 800 billion cubic feet of gas.

Q. I am not talking about that one, I was talking about the first one which covers the ten-year period from 1925 to 1935.

Now, doesn't that one represent the average of the data over that ten-year period?

A. Yes.

Q. And the other points, also, represent the average of the data over subsequent periods?

A. I see what you are getting at.

Q. Now, do you see what I mean?

A. And if we would place it out here, then it would become most convincing that it could not be used in the making up of this graph.

Q. Well, Mr. Hinton, do you now say that the proper place at which to plot these points is somewhere in the center of the period, rather than clear at the end of each period?

A. It really doesn't matter. I cannot see that it would [fol. 5196] make any difference whether you would put them in at the middle or at the end.

Q. Well, suppose you plot the first point, which represents the first line on Page 10, at a point which represents the average production rather than at the end of the ten-year period.

A. Well, could we do this roughly, or do you want me to do it most accurately?

Q. Well, suppose you do it approximately for all practical purposes.

A. I think I can show you here what will happen. This dot (indicating) will be moved up to here (indicating) and

this dot (indicating) will be moved up to here (indicating), and this one up to here (indicating) or, in other words, the dots will slip up or down and the line will pass through them.

The slope of the curve will not be altered by the changing of the plotting of the points.

Q. Suppose you give us the point at which these various points would be plotted upon the basis that I suggested, and I think you had better do it accurately.

Now, I would like to have you do it for the five points, all five.

A. O. K.

Trial Examiner: This must be charted, or it will be as meaningless as the last questions and answers.

[fol. 5197] Mr. Littman: I have just that in mind and we want the witness, therefore, to put the points on here in ink so that they may show in the exhibit.

The Witness: Now, will you tell me at what points you want these plotted? I am not sure that I understand just exactly how you want them.

Mr. Culton: For how many years do you want it plotted?

Mr. Littman: I want them plotted at the proper points on Exhibit 135.

Mr. Culton: The field was brought in in 1918.

By Mr. Littman:

Q. I want these points to bear some relation to the time element which was required to produce the gas, and not way down at the end of the periods.

I would like to have you weight the time element into the plotting of these points.

A. The time element is in here, Mr. Littman. It is in here by the fact that each of these points are plotted when the total withdrawal at a given date was that amount.

. . . . . .

[fol. 5198] Q. Mr. Hinton, have you completed your plotting of the points?

A. Yes, not any too workmanship-like manner, but they are down there in sufficient accuracy to serve the purpose, I think.

Q. And you plotted the points close to the center of each of the periods, each of the five periods shown on Page 10 of Exhibit 42?

A. Yes, as requested by you. However, that is still not exactly accurate.

Q. Well, I understand you are not adhering to your original points, but you will agree, will you not, that a line drawn from the five new points that you have plotted here at my request would have the effect of making the line a more nearly horizontal line than the sharply ascending line which you now have on Exhibit No. 135. Is that right?

A. On the contrary, plotting the points in the middle of the period as requested by you, shows that the acceleration is somewhat accented.

Q. Now, I am talking about five points, giving effect to the first point as well as to the other four.

A. Well, I have placed those points on there exactly as you requested. However, if they were to be placed pro- [fol. 5199] perly, it would have to be done by interpolation.

That is, we would have to find out what percent of this gas was produced at a certain rate, each certain rate, see, and the point would be governed by the percentage that the amounts were produced at those rates.

Q. Mr. Hinton, will you please state the rate of rock pressure decline for the first M. c. f. of the production figures shown on your table on Page 10?

Mr. Culton: The first M. c. f.?

By Mr. Littman:

Q. The first M. c. f. out of the 1,152,514,747 M. c. f. figures shown at the bottom of Page 10 in the column headed, "Production, M. c. f.", and the rate for the last M. c. f. of that figure.

A. No, I cannot and I don't think anybody else can.

Q. Well, it would be different for each, would it not?

A. That is right.

Q. What does your chart show, Exhibit 135?

A. It shows that there is a difference and the amount of pressure required to produce the first M. c. f. of the amount of 1,152,418,747 M. c. f. would be different for the production of the first M. c. f. than it would the last of that amount.

Q. And yet you plot your point at the end of that period, do you not, rather than in the center of the period?

A. I did do that, and I think that it gives an answer [fol. 5200] that is just as accurate as plotting it in the middle, because in order to plot that figure in the middle, it would be necessary to know what the value of each pound of pressure was for each million feet that was produced during the time that that total amount was produced.

Therefore, it would be next to an impossibility to place that point right. If you placed it in the middle of the period, you would be just as much in error, in all probability, as by placing it at the end.

Q. Well, you know you are in error when you place it at the end, don't you?

A. And I would also—

Q. (Interposing). Is that right? You know you are in error when you plot your point at the end of the entire period?

A. Not for the purpose for which it was plotted.

Q. Isn't it a fact that the rate of drop at the beginning of the period, which I just mentioned, for the 1,152,000,000 odd M. c. f. at August 1, 1938, was 15.1 pounds, as shown by your chart, Exhibit No. 135?

A. For what period?

Q. Well, for August 1, 1938.

A. No, I do not know that. That is the point which you asked me to place upon this chart by dividing the production for that period.

[fol. 5201] Q. I am asking you whether or not the rate at the point at which you begin the period for the production of the 1,152,000,000 M. c. f. is the rate of 15.1 pounds.

A. No, I don't think it is.

Q. Isn't the rate of 15.1 pounds, which I just gave you, the rate which applies to, and which is plotted for, the 6 trillion 929 million 385 thousand 631 M. c. f. that is produced in the Panhandle Field, according to your chart, Exhibit 135?

A. Will you point to the point on the chart which you have in mind? You asked me to divide those periods of production and I did so and in so doing, I got a different total accumulated withdrawal.

The total accumulated withdrawal at that time, instead of being 6,929,385,631, is, actually, 6,617,923,050 M. c. f.

Q. Where did you secure that last number?

A. By taking the total accumulated production and dividing the gas that was produced for the period 7-1-37 to 8-1-38 by two, and then adding that half to the previous accumulated withdrawal.

Q. Suppose you tell me what pound decline rate is indicated when the 6 billion 929 million 385 thousand 631st M. c. f. is withdrawn from the Panhandle Field, according to your chart, Exhibit No. 135?

A. The rate of pressure required to produce one tril- [fol. 5202] lion feet of gas from the total cumulative withdrawal of 6,929,385,631 M. c. f. is, as close as I can read it, 15.08 pounds.

Q. Now, will you state the rate which will be required to produce the 8,081,804,379 M. c. f., as indicated by the line on your chart, Exhibit No. 135?

A. That is 16.79 pounds.

* * * * * * * *

[fol. 5207] Cross-Examination

By Mr. Littman:

Q. Mr. Hinton, you have, no doubt, had an opportunity, over the week-end, to reflect a little about the five original [fol. 5208] points designated, "1935, 1936, 1937, 1938 and 1940", respectively, which you plotted on the chart identified as Exhibit No. 135?

A. Yes, among other things, I have given that some consideration.

Q. And perhaps you have given some consideration to the line originally drawn by you on this chart through these five original points?

A. Yes, sir. I gave a great deal of consideration to it before I originally drew it.

Q. Now, what do your say with respect to the original five points plotted on this chart? Do you still feel that

those five points correctly represent the plotting of the data shown in Exhibit 42, Page 10, in the table?

A. I certainly do. However, there might be something misleading about the way that I had the headings or the titles shown on Exhibit No. 135.

Q. What is misleading about them?

A. The pound decline, weighted average pressure, reflects the apparent number of pounds that were needed at the ending of each withdrawal period, and I believe that I have somewhere on here the word, "average," yes.

The average might be misleading, in that it would probably lead anyone who had not gone through the problem, to believe that the points should be plotted midway between the withdrawal points instead of at the end of the [fol. 5209] withdrawal points.

Q. Well, there is only one correct way, mathematically, to plot these points and to draw the line. Is that right?

A. That is right.

Q. And the calibrations, reading up and those reading across, should meet at the proper place, should they not?

A. That is right. And I—

. . . . . .

Q. Now, inasmuch as there is only one correct way, mathematically, to plot these points and draw this line, I would like to have you state whether or not the way that you have done it in Chart Exhibit 135 is correct, mathematically, or not?

A. In the solving of my problem, it is correct.

Q. Mathematically correct?

A. Yes.

Q. Now, you testified—

Trial Examiner: (Interposing) Mr. Littman, if you are going to another line of inquiry, Mr. Hinton should have an opportunity to make the explanation he started to make.

Mr. Littman: Very well.

By Mr. Littman:

Q. Do you have an explanation to make of what you [fol. 5210] have said so far?

A. I just thought it might lend some clarity to the situation.

The amount of gas that is shown between the points plotted for the year 1938 and 1940—

Mr. Culton: (Interposing) You mean the years between the period?

Mr. Wheat: Between which years, so we can be sure?

The Witness: That commences with a period which starts the last five months of 1938 and includes the first seven months of the year 1940.

That represents a total amount of gas between those dates of 1,152,418,747,000 cubic feet, and the rate of pressure decline for that amount of gas was that which is shown at the end of the period.

It might be shown by extending a vertical line through the year 1938 and showing a horizontal line between those two points, more clearly the number of pounds required to produce a trillion feet of gas for the rate required for that period.

Mr. Littman: Will you read the last answer?

(Whereupon the last answer was read by the reporter.)

By Mr. Littman:

Q. And what is the average rate for the period which you just mentioned?

A. I believe it is 16.78, as I remember. It will be shown—

[fol. 5211] Q. (Interposing) We get 16.79, but there isn't enough difference there to quibble about.

A. No, I don't believe we could plot that close on that size paper.

Q. And, am I correct in stating that the center of that segment of the line which represents the production for the period which you just named does not pass through the average figure which you just gave?

A. Yes.

Q. On your chart?

A. It will, Mr. Littman, because, — keep in mind — the pressure decline is governed by the total cumulative withdrawal from the field.

At any point that you wish me to place on that chart, I will do so by applying the average rate of decline for that

five-year period and by interpolating and applying that factor to any given cumulative withdrawal during that period, it will fall on the line or very, very close to it.

Q. Well, the end of your line falls at the average point on this chart of 16.79 pounds, does it not?

A. Yes.

Q. Therefore, your midpoint of the segment for that period does not fall on the average, is that correct?

A. That is correct, that it would not be on the same [fol. 5212] vertical elevation as that point, because the total cumulative withdrawal at that time would have been lower.

As the withdrawal has been lower all the way through this field, we find that a smaller number of pounds has been required to produce the same amount of gas.

Q. Well, Mr. Hinton, I am afraid we will have to go through this step by step to show you that this line is not plotted mathematically correctly on this chart.

Now, you have testified—

A. (Interposing) Just a moment, Mr. Littman. What do you mean by "mathematically correct"?

Q. I mean there is only one way to draw this line and one way to plot these points, and that is in accordance with strict mathematics; you have not followed those mathematical rules in plotting those points and in drawing the line.

Mr. Wheat: Now, Mr. Littman, I think it is only fair to the witness for you to state what the rules are that you are mentioning before you state, in your opinion, that he has not followed the rules.

If you would state the mathematical rules you have in mind, I think the record would be much clearer.

Mr. Littman: I believe that all of that will be shown by the questions I am going to ask and I think I can explain better as we go along, exactly what I mean.

The Witness: Well, now, the method used in plotting [fol. 5213] this is a mathematical method and there is no question as to whether it is or isn't. The rate of pressure

decline is plotted against the various stages of withdrawal in that field.

By Mr. Littman:

Q. Well, let's go through the steps, Mr. Hinton, and perhaps we can show you definitely what we mean

Now, you have testified that the rate of pressure decline, indicated by your chart, Exhibit No. 135, for the 6,929,385,631st M. c. f.—

A. (Interposing) Wait a minute. Let me check that figure. For what period are you reading?

Q. 6,929,385,631st—

A. (Interposing) That should be 985,000, I believe. That is for the first seven months of 1938 accumulated? That is the total amount withdrawn at the end of the first seven months of 1938?

Q. No. I am sorry, it is the first M. c. f. withdrawn at the beginning of the period August 1, 1938, to August 1, 1940. Do you understand me?

A. Yes, but I believe, if you will check your figure, that you will find that the total accumulated withdrawal at that time was 6,929,985,630 M. c. f.

Q. Just a minute, we will check it.

Mr. Goodman: Would that be the addition of the figures in the second column on Page 10 up to 8-1-38?

[fol. 5214] Mr. Littman: That is right.

The Witness: Yes.

Mr. Culton: What is your figure, 6,929,985,000?

The Witness: There is evidently an error in the figures, because these are my basic figures, right here.

By Mr. Littman:

Q. We have checked our figure, Mr. Hinton, and find that the one which I read was right. If you want to check your figure again, you are at liberty to do it.

A. I am working from my basic figures and not the ones that are printed here. It may be that there is an error in these here.

Q. You mean there may be an error in your Exhibit 42 on Page 10? A. That is right.

Q. Well, we worked from the table on Page 10 of Exhibit 42.

A. I believe I have found it. The period from 7-1-36 to 7-1-37 adds up to 552,288,402. It makes very little difference in the calculation.

Q. Well, Mr. Hinton, that wouldn't make the correction that you just mentioned a moment ago?

Mr. Wheat: What correction do you mean, Mr. Littman?

Mr. Littman: Well, the correction he made represented a change of something like 600,000 M.c.f. and the one to which he has just alluded would only change the figure [fol. 5215] a few thousand.

. . . . . .

By Mr. Littman:

Q. I agree that it will, in all probability, affect the final figure so slightly as to make no difference. May we, then, not accept as correct, for purposes of this line of questions, the figures shown in your table on Page 10 of Exhibit 42? A. Yes.

Q. All right. We will start again.

Mr. Culton: That is the aggregate as of August 1, 1938, the total?

Mr. Littman: I was just going to repeat the question again, Mr. Culton, to get back to our original trend of thought.

By Mr. Littman:

Q. You have indicated that the rate of pressure decline, indicated by your chart, Exhibit 135, for the 6,929,385,631st M.c.f. is 15.08 pounds.

A. I have .07, but again, that is a matter of a small difference?

Q. I was referring to your testimony of Friday, which appears at Page—

A. (Interposing) I worked those out and I wrote 15.07 [fol. 5216] down here.

Q. The transcript shows 15.08, but 15.07 is close enough.

Mr. Wheat: It doesn't make any difference at all.

By Mr. Littman:

Q. Pounds, of course? A. Yes.

Q. Now, you also testified that the rate of pressure decline, indicated by your chart, Exhibit 135, for the 8,081,804,377th M.c.f. is 16.79 pounds?

A. That is correct.

Q. Now, we have read the figure which represents the first M.c.f. produced in the period August 1, 1938, to August 1, 1940, and the last M.c.f. produced in that period.

A. No, you have not. You have read an average of those so indicated.

Q. Well, I am talking about the M.c.f. figures.

A. And the decline of the M.c.f. at that period is less than it is at the last, because the total cumulative withdrawal is different at that time.

Q. Mr. Hinton, I was simply trying to give a little resume of what is so apparent to us, that I thought it might be made even more apparent on the record, and I see that we are in trouble again.

Isn't it a fact that the 6,929,385,631st M.c.f. is the first [fol. 5217] M.c.f. that was produced in the period August 1, 1938 to August 1, 1940, which is shown in the bottom line of your Page 10 of Exhibit 42?

A. Yes.

And is it not a fact that the figure which I gave of 8,081,804,377th M.c.f. is the last M.c.f. produced in that period? A. Yes.

Q. That was all that I was getting at, merely summarizing that we have the first and last M.c.f.'s of that period.

A. I understood you to say that the pressure decline was the same in both cases.

Q. Very well. Now, the rate which your chart shows —now, we are speaking of your chart and the line and point on your chart—

Trial Examiner: (Interposing) Chart exhibit what?

Mr. Littman: 135.

By Mr. Littman:

Q. The rate of pressure decline which produced the first M.c.f. in that period was 15.07 pounds?

A. That is right. No, now just a moment there. You almost have me confused. That is not the rate at the first M.c.f., that is the rate that was indicated for the withdrawal of 622,925,161 M.c.f. that was withdrawn from 7-1-37 to 8-1-38 when the total withdrawal had been—

[fol. 5218] Q. (Interposing) Mr. Hinton, I am now endeavoring to ascertain the figure which your chart indicates.

A. (Continuing)—and, as I explained, probably the title on that chart could have been put on there to explain the result more clearly.

Q. Mr. Hinton, you have testified, have you not, that the rate of pressure decline, indicated by your chart, Exhibit 135, for the first M.c.f. produced in that period is 15.07 pounds. Is that not correct?

A. Yes, but I was in error, and I went on [the] explain why I was in error.

Q. You mean your chart is in error?

A. No, I mean that at the end of that period the amount of pressure required was [greatern] than the 15.07 pounds, because that is a requirement for that total period and it would be lower at the beginning and higher at the end.

Q. That is exactly what we are trying to prove, that your points are not plotted where they should be, to-wit, at the midpoint of that production for the period, but I merely, at this stage of the proceeding, am asking you to tell me whether your chart, Exhibit 135, shows that the rate for the production of the first M.c.f. in the period 8-1-38 to August 1, 1940, is 15.07 pounds.

What is the total withdrawal at that point?

A. You mean for the beginning of the period?

[fol. 5219] Q. Yes.

A. The total withdrawal up to that point, up to that period, is 6,929,385,630 M.c.f. Now, the 31st M.c.f. would be the first M.c.f. produced in the next succeeding period commencing 8-1-38.

Q. I want you to tell me what your chart indicates is the rate of pressure decline for that first M.c.f.

A. The rate required to produce a trillion feet of gas, at a cumulative withdrawal total in the field of 6,929,385,631 M.c.f.—that is plotted on there as "9", too, I believe, isn't it?

Well, anyway, the amount of energy required will be about .1410 of one pound beyond the figures shown for the preceding M.c.f. withdrawal.

Mr. Culton: Your figures are all based on decline for million cubic feet and not based on decline for cubic foot or per thousand cubic feet?

The Witness: It is very difficult to figure those on the M.c.f. basis, it would run into many, many decimal places.

Mr. Littman: Will you please read back his previous answer?

(Whereupon, the answer indicated was read by the reporter.)

By Mr. Littman:

Q. Mr. Hinton, didn't you just state a few moments ago that the rate would be 15.07 pounds?

[fol. 5220] Mr. Culton: He said that was per million, counsel, not per pound.

By Mr. Littman:

Q. Mr. Hinton, you did not give me the figure I wanted. I want the rate per trillion cubic feet for the time that the named M.c.f., which I gave you, is produced.

A. And that was 6,929,385,630.

Q. 6,929,385,631st M.c.f.—

A. (Interposing) The apparent rate required to produce the next trillion feet after the point just mentioned by you will be an increase of .141, 308 over the amount of pressure required to produce the previous trillion feet of gas before that point.

Mr. Littman: Will you please read the question to this witness?

(Whereupon, the previous question and answer were read by the reporter.)

By Mr. Littman:

Q. You understand I want the figure in terms of trillion cubic feet, which is the term that you use in this chart.

A. All right. The average pressure required to produce the trillion feet previous to the point referred to on the chart was 15.07 pounds. The average amount of pres-

sure required to produce the next trillion feet will be 16.48308 pounds.

Q. Now, did I ask you anything about the next trillion, [fol. 5221] Mr. Hinton? Can't you confine your answers to my questions? A. No, sir.

. . . . . .

Q. Tell me at which point the M.c.f. that I gave you will show on the left of your chart, the calibrations, vertically.

What rate, calibrated on your chart, is shown for that M.c.f.?

. . . . . .

Trial Examiner: Your remark was inappropriate, clearly.

The Witness: The amount of gas shown at this point, better referred to on the graph as the year 1938, Exhibit 135, expresses in pounds the amount of gas which is required to produce one trillion feet of gas when the total rate of withdrawal had been 6,929,385,000,000 cubic feet and the amount of energy which will be required to produce the next trillion is increased in proportion to the amount that has been required over the past years of field performance.

[fol. 5222] The curve shows quite clearly that the amount of pressure that will be required to produce the next trillion feet of gas will be increased by the amount of 1.141 pounds for the average amount withdrawn.

By Mr. Littman:

Q. Mr. Hinton, did I ask you to give me any figure of increase?

A. Well, Mr. Littman—

Q. (Interposing) Did I or did I not? You are not paying attention to the question, Mr. Hinton.

Mr. Wheat: Mr. Examiner, I would like to have the record show that it is our opinion that a remark of that nature is one for the Presiding Officer to make, rather than for counsel.

Mr. Littman: I am going to ask that that answer be stricken as not responsive.

Trial Examiner: Let me ask you a question here, Mr. Littman.

We are dealing with a very intricate and difficult record, Mr. Littman and counsel for the company. It is important, if the record is to be of any serviceable use when it is completed, that we avoid all possible confusion and unclarities.

I wish, therefore, to ask you at this point, Mr. Littman, what you think would be the smallest unit of production which can be related to a given pressure diminution.

This question is asked purely in my desire to have some [fol. 5223] agreement between us, if possible, as to units, so that we may not be talking about different things or misunderstanding each other.

Mr. Littman: A few moments ago this witness answered my question when he said that the rate of pressure decline indicated by his chart, Exhibit 135, for the first M.c.f. produced in the period August 1, 1938, to August 1, 1940, was 15.07 pounds. That was a correct answer and a satisfactory answer.

I later repeated the same question as a preliminary matter, to go on from there; that was a half-hour ago, and I have been getting all kinds of different answers for the [vary] same question.

Now, what I want to do is, pur ly, to get this witness to tell me, as he did about a half-hour ago, what the rate is in pounds stated down to one-hundredths of a pound and no further, which figures would be useful and appropriate for purposes of this proceeding.

It is only in that way, if your Honor please, that we can leave the first step that I am undertaking to establish.

Trial Examiner: Mr. Littman, this is not at all clear to the Trial Examiner. It probably is to you and your experts, but we have been talking about the production in pressure and the results from the production of a trillion feet of gas.

Now, as the Trial Examiner understands the question you have just posed, you asked for the decline which would result from the production of 1,000 cubic feet.

[fol. 5224] Mr. Littman: No, if your Honor please, I asked for the rate.

Trial Examiner: Let us go back then, to the question that I asked you a moment ago. What, in your judgment, is the smallest unit of production in thousandths of cubic feet which will permit an accurate computation of pressure reduction?

Can we get a starting point, so that we will be talking about the same thing from here on?

Mr. Littman: The rate, if your Honor please, applies to an instant.

Trial Examiner: Well, must we not approach that through a computation based on a given unit?

Mr. Littman: The unit which we are using is M.c.f.

Trial Examiner: A single thousand cubic feet?

Mr. Littman: That is right.

Trial Examiner: And it is your contention that an accurate computation can be made on so small a unit of production?

Mr. Littman: This witness, I believe, can make an accurate reading of his chart at the point at which any given M.c.f. is reached.

Trial Examiner: Is that true, Mr. Hinton?

The Witness: No, sir, Mr. Examiner. The points reflected on Exhibit 135 show the average number of pounds required to produce a trillion cubic feet when the total withdrawal from the field amounts to what is shown on [fol. 5225] the bottom horizontal chart, and in order to arrive at the pressure required for one M.c.f. it would be necessary to apply the fractional part that one M.c.f. is of one trillion to that pressure decline.

Mr. Goodman: I have the feeling that we are getting even more confused. I think that all that Mr. Littman is attempting to do is simply locate points of reference.

In other words, he has asked, "at a certain point, namely, of production, what is the pressure decline used?"

Now, that question, I take it, is impossible of answer, because it must be related to a certain quantity. In other words, you have to have two points of reference in order to get at the element of pressure decline, and I think that the witness and Mr. Littman are at cross purposes between these things.

Trial Examiner: Well, just picking up where you left off, Mr. Goodman, it was the Trial Examiner's understanding of the testimony that there would be an increase of one-and-a-fraction pounds in the pressure reduction to produce the next trillion feet.

Mr. Wheat: Is that correct, Mr. Hinton?

The Witness: Yes, that is correct.

I am truly sorry if I have not been understanding this question correctly, but it is necessary to bring in the previous and the following trillion feet of gas, to be able to answer the question which you asked, Mr. Littman.

[fol. 5226] By Mr. Littman:

Q. I am not asking you, Mr. Hinton, about the rate of change, or the change in rate, you see. I am asking you about a static thing, to-wit, the point on your chart where the calibration in rate of pounds running horizontally across your chart meets the vertical calibration of production.

Now, those two points meet, and all I am asking you is to state the spot on your chart where those two points meet for the production that I am giving you.

Now, do you understand me?

A. Yes, sir, and if I may refer you to Page 10 of Exhibit 42, from the pencil calculations which have been made to the right of that sheet, I feel sure that you understand that those are expressed in pounds decline per trillion cubic feet at the various stages of cumulative withdrawal from this field, and those are the points that are shown on Exhibit 135.

Q. In other words, the points which you show represent the average for each period, do they not?

A. They show the number of pounds required to produce a trillion cubic feet of gas when the total cumulative withdrawal from the field is that expressed on the bottom of Exhibit 135.

. . . . . .

[fol. 5228] By Mr. Littman:

Q. Mr. Hinton, I believe you stated earlier today that the title of your chart was misleading, did you not?

A. Yes, sir.

Q. What title would you suggest for this chart, namely, the chart, Exhibit No. 135?

A. The title I would suggest would be as follows:

"The Rate in Pounds Per Trillion Cubic Feet Required to Produce the Previous Period's Production which are Plotted at the End of the Total Cumulative Withdrawals, at the end of Each Respective Period."

Q. Now, do you have anything further to say with respect to any other data that you have shown on this chart, particularly with reference to the five points which you plotted and the line which is shown thereon?

A. Yes, I think that the title of the vertical scale should not show to be an average.

Mr. Goodman: May I ask a question here.

Mr. Hinton, there has been a discussion off the record between you and Mr. Shattuck, in which you exchanged view concerning the correctness of Exhibit 135, is that so?

The Witness: Yes, sir, that is correct.

Mr. Goodman: And it has seemed to you that there was merit in the comments and suggestions of Mr. Shattuck, hasn't there?

[fol. 5229] The Witness: That is correct.

Mr. Goodman: And you have some corrections, then, that you want to make in that exhibit, isn't that right?

The Witness: Well, I expect that the way to clarify this matter, as a whole, would be to re-make this graph in conjunction with Mr. Shattuck, so that we could be sure that we

understand exactly what we are talking about so, as it is passed on to others to work upon, there will not be anything that is unclear about it.

Mr. Goodman: Now, we understand that this Exhibit 135 does not accurately represent what it purports to represent?

The Witness: It represents—

Mr. Goodman: (Interposing) Just answer my question. It does not represent what it purports to represent?

The Witness: Under strict interpretation, I would say that it does not.

Mr. Goodman: All right.

The Witness: The answer derived represents what I feel will happen.

Mr. Goodman: Do you think that you ought to make some correction in the exhibit to make it clear to everybody concerned?

The Witness: I would say additions, rather than corrections.

[fol. 5230] Mr. Goodman: Very well, but at the same time, the exhibit, in itself, you admit is not clear, and it should be clarified, is that right?

The Witness: From a strict engineering standpoint, I would say that is correct.

Mr. Goodman: All right.

Mr. Culton: May I ask a question here.

You had not prepared that as an exhibit in this case?

The Witness: No, sir, that was prepared for my own reference and, at the end of the preparation of this chart, I checked it by all of the other known data on the Panhandle Field, namely: Did it fit field performance?

I found that it did.

Did it fit the known geological data? I found that it did.

Therefore, I felt that the idea represented on this chart was of sufficient accuracy to be applied to the future of the field.

Trial Examiner: Is it your contemplation, may I ask of Mr. Hinton and Mr. Shattuck, that some modification or supplementation of this exhibit will be produced?

The Witness: I am most willing, for my part, to work with Mr. Shattuck to the end that it is perfectly understood.

Trial Examiner: Would it be practicable, if some re-drafting of this curve is made, to put the re-draft on the [fol. 5231] original sheet, using a different colored ink, perhaps?

Mr. Littman: It will be perfectly satisfactory to us if Mr. Hinton and the engineer of our staff, Mr. Shattuck, were to confer and prepare a new chart or to superimpose upon the chart, Exhibit No. 135, the correct reflection of the data shown in the bottom four lines of Page 10 of Exhibit 42. That would be perfectly satisfactory with us and may save considerable time.

Trial Examiner: It occurred to the Trial Examiner that the whole of the testimony would be perhaps more thoroughly understood if you do use the original and differentiate by variance of colors in connection with any revision which is made.

Mr. Littman: That will be satisfactory.

However, we want it distinctly understood that our collaboration with Mr. Hinton in this regard will simply be to the extent that we will undertake to work on a chart which will represent the data shown on Page 10 of Exhibit 42, and that we will not be bound by that table and the conclusions drawn therefrom.

Trial Examiner: You, of course, do not agree to accept Mr. Hinton's conclusions.

Mr. Littman: That is correct, and we do not agree to accept Mr. Hinton's basic data which appears in the table on Page 10 of Exhibit 42.

[fol. 5232] However, we are anxious that the chart, if it be used at all in this proceeding, reflect the data shown on

Page 10 of Exhibit 42 from which Mr. Hinton has drawn certain conclusions.

I do have one of two questions before leaving this chart, however, which I think would clarify the record on this point.

By Mr. Littman:

Q. Mr. Hinton, looking at the bottom line on Page 10 of Exhibit 42, am I correct in understanding that the average rate of pressure decline per trillion cubic feet for the production of 1,152,418,747 M.c.f. produced during the period 8-1-38 to 8-1-40 was 16.79 pounds?

A. The last trillion of the amount mentioned was.

Q. Your answer to my question is, then, "no?"

A. Yes, it is "no".

Q. That is what you testified to yesterday?

A. No, sir. The 16.79 shows what the pound loss was for the last trillion produced and not for the 1,152,000,000,000.

Q. How did you arrive at the 16.79-pound figure?

A. By finding out what the—

Q. (Interposing) I mean the arithmetical method of getting at it. What did you divide into what, to get this 16.79 pounds? I think the figures are shown in the table on Page 10 of Exhibit 42.

A. I took the 19.35 weighted average pressure loss, in pounds, and divided into that amount 1,152,418,747,000 cubic feet.

[fol. 5233] Q. And you say that the resultant figure of 16.79 pounds does not represent the average pressure drop per billion M.c.f. withdrawn in that period?

A. No, sir, that is for a trillion.

Q. I said, billion M.c.f. If you want to say a trillion cubic feet, that is all right with me, but tell me whether or not, in view of what you have just said, the 16.79 pounds represents the average pressure decline per trillion cubic feet withdrawn during the period 8-1-38 to 8-1-40?

A. Yes, sir, it does.

Q. Now, going to the fourth line of your table on Page 10 of Exhibit 42, will you give us the comparable figure, to-wit, the average pressure decline per trillion cubic feet withdrawn during the period July 1, 1937, to August 1,

1938, in which period there was produced, as shown on this table, the amount of 622,925,161 M.c.f.?

A. Yes, that is the rate per trillion.

Q. What is the rate per trillion?

A. 15.07. I thought you mentioned the figure.

Q. The 15.07 figure you gave represents 15.07 pounds, does it not? A. Yes.

Q. Now, will you give us the comparable figure, to-wit, the average pressure decline per trillion of M.c.f. withdrawn in the preceding period as shown in Line 3 of Page [fol. 5234] 10 of Exhibit 42, to-wit, the period from July 1, 1936, to July 1, 1937, in which period there was produced the total of 552,281,402 M.c.f.

A. Yes. The pressure loss per trillion at that point was 14.39 pounds, and is applied back to that proportionate amount of a trillion produced.

Q. By "at that point", you mean the average for the period? A. Yes.

Q. Now, looking at the preceding period shown in Line 2 of the table on Page 10 of Exhibit 42, will you please give us the average pressure decline per trillion cubic feet withdrawn in the period August 1, 1935, to July 1, 1936, during which period there was produced 556,485,654 M.c.f.?

A. The indicated pressure loss per trillion for that period is 13.50 pounds, and applies to that portion of the trillion produced.

Q. Now, will you give us the average pressure decline, in pounds, per trillion cubic feet withdrawn during the preceding period shown in Line 1 of your Table on Page 10 of Exhibit 42, from the beginning of the Panhandle Field to August 1, 1935, during which period there was produced, according to this table, the amount of 5,197,693,413 M.c.f.?

A. The indicated pressure loss per trillion for that period, as shown in this table, is 42.98 pounds.

[fol. 5235] Q. Thank you.

Now, looking at the most recent period, to-wit, the period August 1, 1938, to August 1, 1940, which is shown in the bottom line on Page 10 of Exhibit 42, and bearing in mind that you stated the average rate for that period was 16.79 pounds, is it not a fact that the rate per trillion cubic feet withdrawn applicable to the first M.c.f. withdrawn in that period was below the 16.79-pound figure which you gave as the average, and is it also not a fact that the rate for the

last M.c.f. withdrawn in that period was somewhat higher than the average rate of 16.79 pounds which you gave us?

A. I agree with you that that would be the case, because that is an average figure.

Q. Now, Mr. Hinton, am I correct in understanding that in drawing your line shown in Exhibit 135, you gave no weight whatever to the production from the Panhandle Field during the period from the beginning of production in that field to August 1, 1935, totaling 5,197,693,413 M.c.f., which is shown in the first line of your table on Page 10 of Exhibit 42? A. That is correct.

Q. Now, the amount of production which I just named for the period embraced by the beginning of production in the Panhandle Field to August 1, 1935, represents approximately what percentage of the total production from the entire field shown on your table on Page 10 of Exhibit 42? [fol. 5236] A. Approximately 60 percent.

Mr. Littman: If your Honor please, I would like to have marked for identification with the next exhibit number, a table which we have prepared entitled, "Acres Used in Determining Weighted Average Pressures of Texas Panhandle Field."

I might state that the source of these figures, as shown in the table, is the Annual Reports of the Panhandle Oil and Gas Field of the Railroad Commission of Texas for the years shown.

Trial Examiner: This table will be marked for identification as Exhibit No. 137.

(Exhibit No. 137 was marked for identification.)

By Mr. Littman:

Q. Mr. Hinton, are you familiar with the figures shown in the table which has just been identified as Exhibit No. 137? A. I am.

Q. Have you had an opportunity to check these figures?

A. Yes, sir. I have checked them and found them to be correct, as shown in the 1940 Report of the Annual Report on the Panhandle Oil and Gas Field, Railroad Commission of Texas.

Q. Now, am I correct in stating that the acreage figures shown in table for identification, Exhibit No. 137, represent

the acreage which was utilized by the Texas Railroad Commission in arriving at the pressure loss, in pounds, figures which you show in your Exhibit 42 at Page 10?

[fol. 5237] A. Yes. Those are the figures upon which the weighted average pressures are determined for the field in the annual reports.

Mr. Culton: Do you know whether those changes in acreage were in high-pressure or in low-pressure areas?

The Witness: No, sir. I have not checked the source of the acreage changes for this exhibit.

Mr. Littman: Could you do that from the reports?

The Witness: Yes.

Mr. Culton: You could not do it, though, to determine which pressure bands they were in could you?

The Witness: You could tell the number of acres that were determined to fall in each pressure classification.

Mr. Culton: Well, without knowing that, this table does not mean anything, does it, from a weighted average proposition?

The Witness: Yes, I think this table means something without that, because it does show the number of acres that have been included in the total field each year, and how they have been segregated into what is known as the East Field, the West Field, for both the sweet and sour areas.

Mr. Culton: I meant, in determining the weighted average, these figures would mean nothing unless you knew how much of it was in each of the pressure bands?

[fol. 5238] The Witness: No acreage figures mean anything until it can be determined into which pressure classification they fall.

. . . . . .

[fol. 5240] By Mr. Littman:

Q. Will you please refer to Exhibit 134, which is one of your working papers, and which is entitled, "Past Production and Estimated Future Production from Panhandle Field, Texas".

You have Exhibit 134 before you?

A. Yes, I have the original of that exhibit.

Q. In Columns 5, 8 and 11, you show the total estimated future annual withdrawals from the Panhandle Field under what you have described as Conditions 1, 2 and 3, respectively. A. That is correct.

Q. And I believe you have identified that these figures shown in Columns 5, 8 and 11 control the slope of the curves designated, "A", "B" and "C" in your chart entitled, "Panhandle Field, Texas, Pressure Trend", Exhibit 133 for identification. A. Yes, sir, that is correct.

Trial Examiner: Your references to Exhibit 134 for identification, Mr. Littman, call for the cumulative columns. [fol. 5241] You say, "5", "8" and "11".

Mr. Littman: No.

Trial Examiner: They call for the annual—

Mr. Littman: (Interposing) For the estimated annual withdrawal column.

I might state that earlier in the record I requested that all copies of this exhibit should bear the numbers 1 to 13, inclusive, for each of the columns shown, reading from left to right, in order to facilitate the case.

Trial Examiner: The reason for the inquiry was that I wanted to know if each date had been numbered as Column 1.

Mr. Littman: That is right.

By Mr. Littman:

Q. Now, am I correct in understanding that Condition 1, which you sometimes refer to as Condition "A", shown in Column 5 of Exhibit 134, assumes that the rate of withdrawals from the Panhandle Field in the future will remain at approximately the 1941 rate?

A. That is correct, down to the year 1953, where there will, in all probability, be a drop-off in the annual rate of withdrawal. For the years following 1956, namely, 1957, 1958, 1959 and 1960, shown on here, are rates of withdrawal which will probably not be experienced but which were used to see what the pressure drop would be at those rates.

Up to 1956, I feel that that is approximately what the [fol. 5242] total withdrawal will be.

Q. Well, now, the curve designated as Curve "A" in Exhibit 133 reflects the figures to which you have just referred and which are shown in Column 5 of Exhibit 134 as "Estimated Annual Withdrawals" under Condition 1. Is that correct? A. Yes, sir, that is correct.

Q. And I note from your chart, Exhibit 133, which was a part of your working papers, the Curve "A" reaches 50 pounds of well head pressure for the entire Panhandle Field in the year 1958. A. That is correct.

Q. Now, am I also correct in understanding that if the annual rate of withdrawals, shown in the column to which I have referred, will be less than you estimated in each year, the effect would be to prolong the indicated life of the field and to extend Curve "A" beyond 1958 to the extent of the reduction of the annual withdrawal figure?

A. Yes, sir. The life of any gas field is governed by the rate of withdrawal.

Q. Now, Condition 2, which you sometimes refer to as Condition "B," and which is shown in Column 8 of Exhibit 134, assumes the same conditions as Condition "A" except that Panhandle Eastern will increase its rate of withdrawals in the future in accordance with the withdrawals shown in Schedule 5 of Exhibit 43 and in Exhibit 131, which [fol. 5243] reflects Mr. Morton's estimate of future sales for Panhandle Eastern. Is that correct?

A. That is a correct statement.

Q. Under this condition, the 50 pounds average well head pressure is reached, as shown by your Curve "B" in Exhibit 133, in what year? A. 1958.

Q. And is it a fact that the curve reaches a point slightly ahead of that reached by your Curve "A" in that chart?

A. Yes. By the term "ahead", it shows that the point of 50 pounds well head pressure will be reached in an earlier part of 1958 than will Curve "A".

Q. As a matter of fact, it would be only slightly earlier than Condition "A", is that correct?

A. That is correct, yes, sir.

Q. Now, Condition 3, sometimes referred to by you as Condition "C", represents the increased withdrawals of all companies in the field, including Panhandle Eastern and as estimated by you. Is that correct? A. That is correct.

Q. And the figures showing the annual withdrawals for that condition are shown in Column 11 of Exhibit 134?

A. Yes.

Q. And is it this latter condition which represents what you believe to be the actual condition to be expected in the field in the future?

[fol. 5244] A. That is correct. In all cases, in all columns mentioned the amounts shown after 1956 are for experimental purposes only, as I do not believe that our company will continue to take gas from that field after the well head pressure has reached the point shown.

Q. And in your opinion, is that, also, true of the other pipe line companies that operate in the Panhandle Field?

A. No, it is not, because the other pipe line companies have not, with the exception of the Northern Natural Gas Company, provided themselves with further reserves.

Therefore, in all probability, it will be necessary for the other major pipe lines to continue to take gas from the Panhandle Field long after the economical point has been reached by the Panhandle Eastern Pipe Line.

Q. Well, how long after that point, would you say?

A. That would be largely dependent upon the price that they receive for their gas.

Q. Well, we will probably go into that phase of the matter a little later. At this time I wanted to make certain that I understood your figures in Exhibit 134.

Now, under Condition 3, sometimes called Condition "C", when is the average well head of 50 pounds reached, as shown by your Exhibit 134 and as shown by the curve designated "C" in Exhibit 133?

[fol. 5245] A. At approximately the end of the year 1956.

Q. In other words, earlier than under Conditions "A" or "B"? A. Yes, sir.

Q. And the reason for that is simply because you are showing a greater withdrawal per year under Condition "C" than under Conditions "A", and "B"?

A. That is correct, yes, sir.

Q. Do I correctly understand your testimony to be that Panhandle Eastern will not be justified in further producing gas in the Panhandle Field after 1956?

A. As we see our problem today, we will not. However, we do not know too much about the Hugoton Field, and it may happen that it will be profitable for us to produce gas in the Panhandle at a well head pressure of 50 pounds

more cheaply than we will be able to produce gas in the Hugoton Field at the pressures which we will experience from that field.

Q. Well, my question, Mr. Hinton, was primarily related to your written testimony which appears about the middle of Page 40 of your Exhibit 42, which reads as follows:

"Therefore, it is my judgment that Panhandle Eastern will not be justified in further producing gas from its reserves in the Panhandle Field longer than 15 years from the present."

A. That is as I see the problem today, yes, sir.

Q. And under Condition "C", you fully expect the [fol. 5246] weighted average well head pressure in the Panhandle Field to reach 50 pounds in 1956. Is that right?

A. The data which has been established leads me to believe that that is very close to correct, yes, sir.

Q. Now, is this true of all of the other natural gas pipe line companies which operate in this field?

A. No, it is not.

Q. In other words, you think that the other natural gas pipe line companies—and by that I mean companies other than Panhandle Eastern—will continue to operate and produce gas in the Panhandle Field after 1956?

A. Yes, but at a far greater cost than their cost of production is as of today.

Q. How long after the year 1956 do you expect the other pipe line companies to operate?

A. That would be a matter that would be entirely dependent upon the management of those companies and their chances of obtaining reserves to carry on their business, elsewhere that were under investigation at the period when they approached that pressure.

There are many things that enter in, but without additional supplies from elsewhere, it will not be a great length of time for the major companies.

The local companies and the gasoline plants can probably continue to operate several years after the major pipe lines [fol. 5247] no longer take gas from this field.

Q. Well, looking at your Exhibit 134, in the last line you show that there will be no remaining rock pressure in

the year 1960 under any of the three conditions. Is that correct?

A. That is right, because if the rate of withdrawals were experienced that are put down here, that would be the case; however, I don't anticipate that these rates of withdrawal from 1956 to the period 1960, shown on Exhibit 134, will be experienced.

They were merely put down there to see where the problem carried us and see what might happen at those rates of withdrawal.

Q. Well, is it your testimony that the annual withdrawals shown in Exhibit 134 are correct under each of the conditions that you have described through the year 1956? A. Yes.

Q. Then, you are now stating that the figures that appear for the remaining years, namely, 1957 through 1960, are not the annual withdrawals which will be made under those conditions?

A. That is right. They were placed upon this set of calculations to see what would happen, what we could expect if those rates of withdrawal were experienced.

Q. Now, do I understand your testimony to be that the [fol. 5248] amounts of annual withdrawals shown in Columns 5, 8 and 11 of Exhibit 134 are the withdrawals which can be made from the field through the year 1956?

A. Yes, that is correct.

Q. Mr. Hinton, we were referring a moment ago to natural gas line companies other than Panhandle Eastern.

A. Yes.

Q. Suppose I name a number of companies that operated in the field and you tell me whether your definition of natural gas pipe line companies includes at least the following companies:

Texhoma Natural Gas Company.

A. Yes, producing for the Natural Gas Pipe Line Company of America.

Q. Northern Natural Gas Company? A. Yes.

Q. Canadian River Gas Company? A. Yes.

Q. Lone Star Gas Company?

A. Yes, but I don't give as much weight to that as I do to the other companies, because it furnishes markets closer to the field than the other companies.

Q. Well, markets supplied by Lone Star in any substantial quantities are a considerable distance from the Panhandle Field, are they not, at least a hundred miles? [fol. 5249] A. That is right.

Mr. Culton: That isn't very far, though, as compared with the others?

Mr. Littman: Well, Mr. Culton, perhaps you can tell me the distance from the east Panhandle Field to Dallas?

Mr. Culton: About 300 miles. Something over 300 miles.

By Mr. Littman:

Q. Would I be correct if I had stated 300 miles rather than 100 miles?

A. I don't think that Lone Star takes any great quantity of gas from the Panhandle Field for their Dallas market.

Q. I see.

A. It goes to Wichita Falls. That is their principal market.

Q. How far is Wichita Falls from the Panhandle Field?

Mr. Culton: Something over 200 miles.

By Mr. Littman:

Q. Is that correct?

A. I would imagine. I don't know exactly that. It is a little off my beat.

Q. You expect the Lone Star Gas Company to continue to operate in the Panhandle Field for some short time after the other large pipe line companies will have abandoned their properties? Is that right? A. Yes.

[fol. 5250] Q. Well, let's go on with my list.

Cities Service Gas Company?

A. Yes. Cities Service can also move from the Panhandle Field if [their] so desire, as they maintain a substantial reserve in the Hugoton Field.

Q. And Cities Service Gas Company is included within your category of natural gas companies, as you have described it in your testimony a moment ago?

A. That is correct.

Q. Consolidated Gas Company? A. Yes.

Q. United Gas Pipe Line Company?

A. I will have to check that one. I have a list of all of them. Well, go ahead. I will say yes.

Q. If you want to change that later, you are at liberty to do so. A. Yes.

Q. Do you have any others in mind or have I named the major pipe line companies that operate in the field?

A. It seems to me as though there is one that takes a sizeable amount of gas that has been left out, but I can't think what it is.

Mr. Culton: He hasn't mentioned the Denver Line, has he?

The Witness: Yes, Canadian River.

Mr. Culton: How about Consolidated?

[fol. 5251] Mr. Littman: I mentioned Consolidated.

Mr. Culton: You have covered them all, I think.

The Witness: The Panhandle Power and Light take a considerable amount of gas, too. It goes to Borger. In fact, there are 23 pipe lines taking gas from the Panhandle Field at this time.

By Mr. Littman:

Q. Now, the annual withdrawal figures which you have shown in Exhibit 134, under all three conditions, of course, include figures for these natural gas pipe line companies which I have named? A. Yes.

Q. As well as other withdrawals?

A. That is correct, yes, sir.

Q. Now, in 1956—and I presume your figures here speak as of the end of the year, do they not? A. Yes, sir.

Q. In 1956 you show under Condition "A", the rock pressure in the field will be 74.52 pounds.

A. The observed well head pressure.

Q. I meant the well head pressure rather than the rock pressure. Is that right? A. Yes, sir.

Q. And under Condition "B", the well head pressure, as of the end of 1956, will be 72.74 pounds?

[fol. 5252] A. That is correct, 72.74 pounds.

Q. And under Condition "C", 50.15 pounds?

A. That is correct, in all cases.

Q. And, of course, those well head pressures are predicated upon the amounts of annual withdrawals which you have set forth in your Columns 5, 8 and 11, respectively? Is that right? A. Yes, sir, that is right.

Q. And which amounts are those which you say can and will be withdrawn under the three conditions which you have described, through the year 1956?

A. Of course, I say that is right, with the qualification, instead of saying it will, I would again like to say it is an estimate and it won't be exactly this, but it is the best estimated figure that I can produce.

Q. It is your best judgment? A. Right.

Q. Now, let's confine ourselves, for the moment, to Condition 2, sometimes called by you Condition "B"; the annual withdrawal figures for that condition are shown in Column 8. Is that right? A. Yes, sir.

Q. Will you state how you arrived at the figures in Column 8 which are called, "Estimated Annual Withdrawal, Condition No. 2, in M.c.f."?

[fol. 5253] A. Yes, I merely took the market, which was assumed to be approximately correct, for the year 1941 for the total withdrawal from the fields, and I kept all other markets approximately as they were, or as they were, and added the amount which Panhandle would expect to take in addition to that amount under the anticipated load schedule.

Q. And the amount which was taken in the year 1940 from the Panhandle Field by all producers other than Panhandle Eastern, was 566 million M.c.f. Is that correct?

A. No, sir.

Q. Will you give me the correct figures?

A. 597,467 M.M.c.f.

Q. What was the figure for the year 1941?

A. It was partially an estimated figure based upon what was happening at the midyear, and taking into consideration the probable withdrawal for the next year and was estimated to be 610,000 M. M.c.f.

Q. Now, you haven't given me the figure I wanted, Mr. Hinton. I want the figure in the year 1941 which represents the withdrawals by all producers other than Panhandle Eastern Pipe Line Company in the Panhandle Field.

A. 1941 was estimated to be approximately 44 million M.c.f. by the Panhandle Eastern.

Q. Well now, will you give me the figures for all others than the Panhandle Eastern?

[fol. 5254] A. 566,000 M. M.c.f.

Q. Now, to that amount of 566,000 M. M.c.f. you have added the amount of production which you estimate will have been taken from the field by Panhandle Eastern for the year 1941. A. 44,000 M.M.c.f.

Q. Which gives you the amount of 610,000 M.M.c.f., shown for the year 1941 in Column 8 of Exhibit 143?

A. Yes, sir, that is correct.

Q. Now, am I correct in understanding that you followed the same procedure for all of the subsequent years, that is, the years subsequent to 1941 shown in Column 8?

A. That is correct.

Q. In other words, you assume throughout this column that all producers other than Panhandle Eastern Pipe Line Company will take out 566,000 M.M.c.f.?

A. That is correct.

Q. And to that annual sum you have simply added the amount which Panhandle Eastern will produce from the Panhandle Field, the total of which is shown for each year in Exhibit 131 in the third column. Is that right?

A. Yes, that is correct.

Q. Now, stating it another way, if we were to take the total of the figures shown in your Schedule 5 of Exhibit 43 and add those amounts each year to the 566,000 M.M.c.f. [fol. 5255] produced by others in each of the years subsequent to 1941, we would secure the same total which you show in Column 8 of Exhibit 134?

A. No, not exactly, because the amount of gas which is estimated to be used on the lease for the drilling-in of wells and maintaining wells varies through the latter years of that schedule.

Q. Mr. Hinton, that is not our understanding of the figures which you show in Column 8 of Exhibit 134.

According to our arithmetic, if you take 566,000 M.M.c.f. in each year shown in Column 8, and merely add to it the amount which you estimate will be withdrawn by Panhandle Eastern in increasing amounts through the years, as shown in the third column of Exhibit 131 and as shown in Schedule 5 of Exhibit 43, you will secure the total shown in Column 8 of Exhibit 134 for each of the years.

A. That could be correct, although I feel quite certain that the amount of gas that was estimated for lease use dropped slightly during the last few years.

Q. Do you want to test some of these figures and make certain about that before we proceed?

A. Mr. Littman, I believe that the total shown here would not be affected by that, inasmuch as it would be a total drop-off in any case, regardless of the purpose for which it was used.

[fol. 5256] Q. In other words, you are saying it wouldn't make any substantial difference, one way or another?

A. That is correct.

Q. Then, may we, for all practical purposes, state that your column 8 holds constant an annual figure of 566,090 M. M. c. f. through the years for all producers other than Panhandle Eastern in the Panhandle Field?

A. I think that we could, yes, sir.

Q. And by adding to that the annual amounts which you have estimated can and will be withdrawn under Mr. Morton's increased load estimate, we will then have the same total substantially as that in Column 8 of Exhibit 134?

A. That will be correct, yes.

Q. For each of the years?

A. Yes.

Q. Now, Mr. Hinton, another way of stating that situation is to say that all other producers in the Panhandle Field, other than Panhandle Eastern, will produce from the years 1941 through 1956, 100 percent of the amounts which were produced by those companies in the year 1941?

A. Yes. I believe the term "withdrawn" would probably be better than "produced," because we think of produced gas as metered gas and this is all non-metered gas, not all metered.

Q. That is perfectly all right for you, so far as I am concerned, to use the term "withdrawn." Perhaps it is more accurate.

[fol. 5257] Well, at any rate, we understand each other to the extent that Column 8 shows or reflects a condition under which, through the years 1942 through 1956 and in each annual period, all companies other than Panhandle

Eastern, are going to be able to secure 100 percent of the amount of gas which they were able to secure in 1949? Is that right?

A. That is correct.

Q. Now, looking at your Exhibit 131, which shows the same figures, substantially, as those shown in your Schedule 5 of Exhibit 42, I am going to ask you to give us the percentage of production by Panhandle Eastern in the Panhandle Field for each of the years 1949 through 1956, as related to the years in which Panhandle Eastern, according to your testimony, will be able to withdraw the annual maximum amounts, to-wit, the years 1945 through 1948.

A. May I see that exhibit?

Q. Now, before you do that, Mr. Hinton, let me get clear on the record that in 1945, according to your Exhibit 131, Panhandle Eastern will reach its peak of annual withdrawals.

A. That is correct.

Q. And that peak is 60 million M. c. f., is it not?

A. Yes, sir, that is right.

Q. And in 1946, the same amount will be withdrawn?

[fol. 5258] A. That is correct.

Q. And the same is true in 1947 and in 1948?

A. That is right.

Q. Now, taking those annual production figures as 100 percent, I want you to relate to that maximum annual withdrawal the withdrawals which you expect Panhandle Eastern to take from the Panhandle Field, both produced and purchased gas, for each of the annual periods subsequent thereto.

Mr. Culton: Doesn t that all show on Exhibit 131 in the record now?

Mr. Littman: No, Mr. Culton, those percentage figures are related to the total take by Panhandle Eastern.

Now, I want him to relate the annual production in 1949, for example, to the annual production in the peak years 1948, 1947, 1946 and 1945, using the latter peak years as 100 percent.

The Witness: You mean, using the 60—

By Mr. Littman:

Q. (Interposing) Using the 60 million M. c. f. as 100%.

Do you have the figures for one year? In other words, I want to make sure that you are answering my specific question rather than have you go all the way through and then have to go back again.

A. Yes, I do. I will try to stick to specific questions. This is the percent of gas which it is estimated will be [fol. 5259] withdrawn for the year 1949, 91.67 percent of that which will be withdrawn in 1948.

Q. And 1948 is the peak year which you are using as 100 percent?

A. That is correct.

Q. That is, it is one of the peak years, I should say?

A. Yes.

Q. Now, will you go on down, and give us the percentage for 1950?

A. For the year 1950, we estimate that we will withdraw from the Panhandle Field 83.33 percent as much as during the peak years 1945 to 1948, that amount being 60 billion cubic feet.

Q. That is the latter amount, being 60 billion.

Mr. Wheat: What was the 1950 percentage?

The Witness: 83.33.

Do you want me to continue.

By Mr. Littman:

Q. Yes, sir.

A. For the year 1951, the amount estimated to be withdrawn from the company and purchased wells will be 75 percent as much as in 1948.

Q. Yes. This is for Panhandle Eastern?

A. Yes. For the year 1952, it is estimated that 66.67 percent of the amount produced during the peak years will [fol. 5260] be produced.

Q. Very well.

A. For the year 1953, it is estimated that there will be 53.33 percent of the gas withdrawn that we estimated could be produced in the year 1948.

For the year 1954, it is estimated that we will withdraw 36.67 percent of the total withdrawn in 1948.

In 1955, it is estimated that we will withdraw 16.67 percent as much as we did during the peak years 1945 to 1948.

In 1956 it is estimated that we will withdraw 11.67 percent of the total of 60 billion for the years 1945-1948.

Q. In other words, Mr. Hinton, it is your judgment that, from 1948 through 1956, Panhandle Eastern will be able to produce in the Panhandle Field less and less gas in each successive year, down to as little as 11 percent of the amount which it produced in 1948, one of its peak years?

A. Without making additional capital expenditures, that is correct.

Q. The capital expenditures which are contemplated to be made in order to produce the amounts of gas which you estimated will be withdrawn in the future years, as shown in Schedule 5 of your Exhibit 42 and as shown in Exhibit 132, are detailed in your Exhibit 42 from Pages 26 to 32, inclusive, for the five and a half-year period beginning in the middle of 1941 and extending through 1946 and in the total amount of $7,147,219. Is that correct?

[fol. 5261] A. That is correct.

Mr. Culton: Just a minute. That figure is hardly accurate. You are referring to the capital expenditures in both fields, are you not, $7,000,000?

Mr. Littman: Yes, but, of course, the details of the Panhandle Field are shown on the pages that I just referred to, are they not?

The Witness: Yes, and they do cover a 5½ year span, but no capital expenditures are shown beyond that date and we certainly are not assuming that we can continue to take the amounts of gas that are set out here without making additional capital expenditures in addition to those shown.

By Mr. Littman:

Q. In other words, you fully expect that Panhandle Eastern will expend additional sums after the 5½ year period, to-wit, after 1946, in order to obtain the quantities of gas which are shown in Exhibit 132. Is that correct?

A. Yes, there will be some. There will be no major items, however, as it would be very difficult to justify a

large capital expenditure at that period of the life of the field.

Q. In other words, Panhandle Eastern expects to spend for capital additions such sums and all such sums as may be economically expended in order to produce the amount of gas which you estimate in Exhibit 132?

[fol. 5262] A. Yes, sir.

Q. And which figures are reflected in Column 8 of Exhibit 134?

A. That is correct.

Q. In other words, your estimate so far as the Panhandle Eastern take is concerned is predicated upon all that can and will be economically spent in order to produce the amounts of gas which you have estimated?

A. That is correct.

Q. And the best that Panhandle Eastern can do in 1956 is to produce under those conditions only 11 percent of the quantities of gas which it has produced in 1948, one of its peak years. Is that correct? Can you answer that yes or no?

A. No, I can't answer it yes or no.

Q. Well, what do you say about my question?

A. I would say that it would be largely dependent upon what the Hugoton Field turns out to be.

Q. Well, if the Hugoton Field turns out to be something other than you have assumed it to be, that wouldn't have any effect upon your taking any more gas out of the Panhandle Field, would it?

A. It certainly would.

Q. Now, in 1956, according to your best judgment, under Condition "B" all the other producers in the Panhandle Field except Panhandle Eastern, will be able to [fol. 5263] withdraw 100 percent of the amount that they withdrew in 1948 and years prior thereto?

A. I would say that that would be substantially correct.

Q. And under Condition "C", it is your testimony that the other producers will be able to take even larger amounts than those shown under Condition "B." Is that right?

A. That is correct.

Q. Whereas, Panhandle Eastern, in 1956, according to your testimony, will be able to economically produce only 11 percent of the production which it secured in the peak year 1948?

A. Taking the acreage division in the field, and taking the operating cost, that is what we anticipate it will be in the Hugoton Field at that time.

I would then say it would be uneconomical for us to take larger amounts from that field if my estimates prove to be correct.

Q. Well, if it is uneconomical for Panhandle Eastern to produce more than 11 percent in 1956 of the amounts which it produced in its peak years, by what process of reasoning do you come to the conclusion that it will be economical for all the others to keep going at full blast right down through the year 1956?

[fol. 5264] A. It will be, for this reason, that the other major pipe line companies in that field now hold a far greater amount of acreage than does Panhandle Eastern, therefore, it will be possible for them to drill more wells, to take less gas out of each well, but on a whole, to operate at a higher pressure than we would be able to do in that field.

The companies that have not provided themselves with reserve acreage in other fields have designed their systems in such a manner that by cylinder changes they can lower the pressure on their system more than can Panhandle Eastern, and they have been operating at a lower pressure for some time.

Does that answer your question, sir?

Q. I believe in one part of your answer you said, "higher" rather than "lower" pressure.

Didn't you mean lower pressure? I believe you misspoke yourself.

A. I was thinking in terms of a compressor station and not the well head.

Q. I see. Then, it is your testimony, Mr. Hinton, that in 1956 these other producers, all of them other than Panhandle Eastern, will be able to economically produce at 100 percent of their 1948 production?

A. The question of economics is dependent upon the ceiling price of the gas. If we are able to carry on our development in such a manner that we are able to produce

[fol. 5265] gas at a lower cost than the other companies, that is our good fortune, and we have made provision for that very thing by obtaining a reserve in a field where we can expect to operate at higher pressures and on a more economical basis.

Q. Now, have you made any investigation of the economies of the operation of all the other natural gas pipe line companies in the Panhandle Field to ascertain whether they could economically withdraw any such amounts as 100 percent in 1956 of that which they withdrew in their peak years?

A. Not in detail, but I can tell you this, that the drilling programs of the other companies indicate, and if you would care to talk to them about it, they will substantiate it, that the number of wells that they are drilling now is with an eye to the future.

By that I mean that they are going to be forced to take a smaller amount of gas from each well, as years go on, and you can see what an orderly program is in my exhibit for the Panhandle Field.

In other words, when we have completed 15 more wells in the Panhandle Field, then we have drilled up all of our acreage held by delayed rentals.

The Canadian River, the Texhoma Natural Gas, have innumerable locations yet to drill.

Q. Well, have you made a study of how many wells these other companies would have to drill to get any such [fol. 5266] quantity of gas out of the Panhandle Field as those quantities which you show for the year 1956 in Exhibit 124?

A. No, not in any detail, but I do know this, they are going to be forced to produce gas under very undesirable conditions at great cost.

* * * * * * * * *

[fol. 5267] By Mr. Littman:

Q. Mr. Hinton, in the year 1956, under your Condition "B" in which year all other producers than Panhandle Eastern will be withdrawing gas at full blast, 100 percent of their peak years, what will be the rock pressure at that time, according to your Exhibit No. 134?

I mean, the well head pressure?

A. 72.47 pounds.

Q. And that is under Condition "B"?

A. Yes.

Q. And under Condition "C", under which condition, according to your testimony and this Exhibit 134, the producers in the field, all of them other than Panhandle Eastern will be producing even more gas than under Condition "B". Is that right?

A. Yes, that is right. That is, I assume that they will, and these figures are based upon that assumption.

Q. Well, is the assumption a correct one?

A. As nearly as I am able to forecast, it is.

Q. What is the well head pressure average throughout the Panhandle Field in 1956, under Condition "C"?

A. 50.15 at the places where the average rate of withdrawal has been experienced through the years.

Q. And not withstanding the average well head pressure of only 50 pounds in 1956, you still expect all produc-
[fol. 5268] ers, other than poor Panhandle Eastern, to be able to get as much gas out of the field as they did back in the flush year of 1948, is that right?

Mr. Culton: Do you mean "poor Panhandle Eastern" or "fortunate Panhandle Eastern"?

The Witness: That is what I was going to say. I would say, "poor other producers and fortunate Panhandle Eastern," because they are not going to be forced to produce gas at that pressure to stay in business, while the other companies are.

Now, if the other companies decide it is no longer economical to produce gas at these low pressures and they go out of business previous to this date, naturally, the life of our reserves will be extended.

However, if they build the Milwaukee line and that gas is taken from the Panhandle Field, our life will be shortened.

By Mr. Littman:

Q. All of that depends, does it not, upon the economics of the situation down around the year 1956 and along about that time. Is that right?

A. I would say, commencing in 1954.

Q. And if it is not economical for the producers other than Panhandle in the year about 1954 to spend the money which is required to produce the same amounts of gas in those years as they had back in 1948, why, then they, the other producers, would cease operations and the life of the field would be extended?

[fol. 5269] A. That is correct.

Q. And might they not, in the year 1954, for example, rather than spend these huge amounts for capital additions in order to take 100 percent of the amounts that they took in flush years, rather go ahead and produce less gas with a lower capital expenditure? Is that right?

A. No, I do not think that could turn out that way, Mr. Littman, because they have a certain area to serve and I do not believe that these gas companies will drop off certain areas and continue to serve others, major areas, I am speaking of.

Q. What is there to prevent these other companies from going into the Hugoton Field and supplementing their supply as Panhandle Eastern expects to?

A. The sad, small supply of available acreage which is now not held by development or delay rentals in blocks of sufficient size to enable any major pipe line company to obtain acreage in the amounts that would be large enough to provide the necessary reserve for them to carry on the same volume of business.

Q. Have you made a detailed investigation of the available acreage in the Hugoton Field?

A. I am, I believe, about as familiar with it as anyone that goes down around the Hugoton Field.

[fol. 5270] Q. Are you the only company that operates in the Hugoton Field?

A. No.

Q. Name the other pipe line companies, natural gas pipe line companies that operate in the Hugoton Field that also operate in the Panhandle Field.

A. The Northern Natural Gas Company.

Q. Any others?

A. No, not that operate in the Panhandle Field.

Q. Northern Natural?

A. That is right.

Q. Well, the Northern Natural stands in very much the same position as Panhandle Eastern, does it not, in that it operates in both fields?

A. Well, they do not have as large a reserve in the Panhandle Field as we do.

I believe that your question would better be answered by saying that I would say that they were in the same category.

Q. Have you endeavored to ascertain how much horsepower would be required to produce anything like 618 million M. c. f. in the year—I beg your pardon—621 million M. c. f. in the year 1956?

A. No, I have not, because it would be a tremendous job and I know that it would run into many, many, many thousands of horsepower.

[fol. 5271] Q. And many, many, many millions of dollars?

A. Right.

Mr. Culton: Are you expecting that 600 million to all be carried out of the field?

Mr. Littman: Out of the Panhandle Field.

The Witness: No, but we know that the gasoline plants are going to continue to operate at probably the same volume as they are.

We know that it is going to take considerable gas to maintain the number of wells which will be then drilled in the Panhandle Field and the amount of gas which will be taken by pipe line companies at that time will have dropped off some, and I believe that of the total amount of 621 million M. c. f., of that amount 258,700 will be used by pipe lines.

By Mr. Littman:

Q. How did you arrive at that figure?

A. Because that is the amount of gas that I estimate to be utilized by pipe lines in the year 1956.

Q. What percent of gas is taken out of the Panhandle Field now by the major pipe line companies?

Mr. Culton: That calculation is all available now, Mr. Littman, if you want to put it in evidence. That is the tabulation you requested the other day, the breakdown.

Mr. Littman: Well, we will probably do so after examining it. I have not seen it yet, but I will be grateful if [fol. 5272] those figures are made available.

Mr. Wheat: It just came in.

The Witness: For the year 1940, the percent of the total withdrawal from the Hugoton Field which was used—

Mr. Culton: (Interposing) You mean the Panhandle Field?

The Witness: Or the Panhandle Field, which was used by pipe lines was 39.48 percent of the total.

By Mr. Littman:

Q. What year was that?

A. That was in 1940.

Trial Examiner: Is that all sweet gas, Mr. Hinton?

The Witness: No.

Trial Examiner: That includes the sour gas used for carbon black processing as well as the casing head production?

The Witness: It also includes casing head gas not treated, blown to air, which is an estimated figures, and the gas blown to air that is used in the drilling-in of wells and the maintenance of wells and testing of wells.

By Mr. Littman:

Q. Do you know what the percentage was for the first six months of 1940 as shown by the 1940 Report of the Texas Railroad Commission?

A. No, I do not. That will show on the 1940 Report, but will not give any allowance for the amount of gas which was estimated to be blown in the air.

[fol. 5273] Q. Now, you would have to know a number of things, would you not, to be able to tell whether or not it would be economical for the producers in the Panhandle Field, other than Panhandle Eastern Pipe Line Company, to produce the amounts of gas which you show under each of these Conditions "A", "B" and "C" in Exhibit 134 for the year 1956?

A. Yes, that is correct.

Q. And will you just enumerate the things you have to know to be able to tell whether or not it will be economical to produce that amount of gas?

A. I would have to know every item of expense that would be incurred by that company to operate so that I could determine whether the total cost of producing that gas added to the other operating costs would enable it to sell the gas at a profit.

Q. Now, did you do that?

A. No.

Q. And you would have—

Mr. Goodman: (Interposing) Can I ask a question?

Mr. Littman: Yes.

Mr. Goodman: Did you do that in respect to your own company?

The Witness: No. That is not possible to do at this time, because we do not know what it is going to cost us to produce gas at the pressures which will be experienced in those years.

[fol. 5274] Mr. Goodman. And to what extent, within your knowledge, was that done with your own company?

The Witness: Probably not in any great detail, because we have a safety valve, you might say, and that is due to the fact that when we get down to the point where our Accounting Department figures show it is no longer profitable to produce gas, we can remove our source of withdrawal.

Mr. Goodman: You indicate the Accounting Department has figures on this subject?

The Witness: I assume that there could be figures compiled to show what the operating costs would be through the years.

Mr. Goodman: Well, you spoke about how you would find out whether it was economical for the other companies to produce, and I asked you whether you could ascertain the economics of production or the economy of production for your own company, and you said "no",

and I asked you to what extent that had been done, if you knew, and you referred to the Accounting Department.

Now, does the Accounting Department, within your knowledge, have figures as to the extent to which it is economical to produce in the future from the Panhandle Field?

The Witness: No, because we do not know what the future price will be.

[fol. 5275] Mr. Goodman: That is all.

By Mr. Littman:

Q. You would have to know all of those things in order to make an accurate determination of the amount of production which would be expected from the Panhandle Field in, for example, the year 1956?

A. I feel that that is a statement that covers my idea.

Q. Have you ascertained how many wells would be required to be drilled in order to produce anything like 621 million M. c. f. from the Panhandle Field in the year 1956, at which time the well head pressure average throughout the field will be, according to your testimony, only 50 pounds?

A. No, I have not made a detailed estimate of that, and I think it will be rather difficult to make, inasmuch as a great deal of the undeveloped acreage is marginal acreage which will probably prove to have little value, and it will probably require a greater number of wells, than if we would base it upon the present portion of the field development.

Q. Do you have any idea as to how many times as many wells that are now in the field will be required to produce that amount of gas which you indicate in the year 1956?

A. No, I have not made that study. It could be estimated from known data very closely. I would say that it would be in the neighborhood of some 3,000 wells.

[fol. 5276] Q. 3,000 additional wells?

A. Yes. That is a very rough estimate.

Q. How many wells are there now in the Panhandle Field?

A. I will have to refer to the last Annual Report of the Railroad Commission.

Mr. Culton: Some portions of that casing head gas are produced from oil wells, are they not?

The Witness: Yes, but I do not believe there will be any great amount at that time.

The number of wells located in the Panhandle Field as of July, 1940, was 1,654 wells.

By Mr. Littman:

Q. It is your testimony at this time, by way of rough calculation, that you would have to have an additional 3,000 wells drilled in the Panhandle Field in order to produce the volumes of gas which you show in your Exhibit 134 for the year 1956?

A. Yes, and the working pressures that would be required to produce that would be considerably below the observed well head pressure.

Q. Do you know how much additional horsepower will be required to produce the amounts of gas which you show in 1956?

A. No, I do not know offhand. I could probably calculate it if you wanted to go into it in that detail, but after we made all of our calculations and got all through, we would still be basing it on an estimate, and the accuracy [fol. 5277] of the result would be no closer than the accuracy of my estimation.

Q. These questions I am asking you relate to ascertaining the economic feasibility of doing what you estimate will be done. Is that correct?

A. Yes, I would say that they do relate to it.

Q. And yet, you did not, up to this time, make any estimate of these matters which we are discussing, to-wit, the number of additional wells that would be drilled and the cost of those wells, and the amount of additional horsepower which will be required, and the cost of that additional horsepower?

You did not make any investigation of that, did you?

A. Not detailed. I made an estimate of it just from observation of the field, knowing in the background at all times, that if it was possible for Panhandle Eastern to

produce greater quantities of gas than those shown in Exhibit 131, that it would not wait until such time as the pressure had gotten down to 50 pounds to produce it, that the total takes by Panhandle Eastern will be taken at a time when they can be taken for the least amount of operating expense.

Q. But, Mr. Hinton, my question related to the estimated takes by producers other than Panhandle Eastern.

A. That is right.

Q. Now, what is your answer to my question? You made no investigation—

[fol. 5278] A. (Interposing) No detailed investigation, no. It is just a knowledge of the situation as it exists and what it will probably be.

Q. And you did not make any investigation either of the amount of gathering lines and well lines and looping of lines that would be required to extract from the Panhandle Field in 1956, the total amount of gas which you show in 1934. Is that correct?

A. That is correct. You cannot, in a five-weeks' period, make that study in conjunction with other material that had to be prepared.

There would have been little time to have devoted to a detailed study of that nature.

Q. As a matter of fact, if you wanted to be anywhere near accurate about it, you would have to make the same kind of detailed study for all of the other companies and for each of the remaining years, that you made for Panhandle Eastern for the 51½ year period beginning June 30, 1941, as shown in Exhibit 42?

A. That is right, but the total result, whether they quit one or two years earlier than I have estimated that they will stop taking gas, does not influence our problem a great deal because, by that time, we will have withdrawn greater amounts from that acreage and, at that time, we would have to apply the time element to the four dimen-
[fol. 5279] sions which we have previously spoken of, that is, length, width, depth and pressure.

We would have to apply the time element for the flow of gas to get into the well head and that would govern the amounts of gas which we would be able to take.

It is my idea that when the load becomes as low as shown here—

Q. (Interposing) As shown here, will you refer, please, to what you have before you?

A. For the year 1956, shown in Exhibit 131—that that will not be used every day. It will merely be allowed to migrate into the well bore as much as it is possible for it to do and it will be used to augment peak demands.

Q. Mr. Hinton, did you consider the peak demands of these other companies in the year 1956 and thereabouts, in making this study?

A. The peak demands of the other companies are not of the nature that our peak demand is, other than the Northern Natural Gas Company.

Q. Well, will Northern Natural Gas Company be able to supply its peaks in 1956?

A. Yes, because it maintains a reserve in the Hugoton Field.

Q. Mr. Hinton, at what abandonment pressure do you [fol. 5280] expect Panhandle Eastern's wells, on the average, to be abandoned?

A. From 300 pounds to 25 pounds.

Q. Well, I asked you for the average?

A. I would not want to make an average figure, because we do not know.

Q. At what pressure do you think most of the Panhandle wells will be abandoned?

A. I hope it will be extremely low, but the indication is, and past records lead me to believe there will be a great number of wells that will be plugged at a comparatively high pressure.

Q. What is that pressure?

A. I refer now to a list of wells which have been plugged in the Panhandle Field that was obtained from the records of the Railroad Commission for me by Jimmie Massa, and these wells have been plugged and abandoned since January 1, 1939, up to the middle of this year.

There is a total of 38 wells, and the abandonment pressures range from 304 pounds down to 7 pounds.

Q. Well, what is the average to which you referred a moment ago?

A. Just looking this over, I would say that it would probably be between 135 and 150 pounds.

Q. Average abandonment?

[fol. 5281] A. Basing it upon the list that I am looking at, and not on my idea.

Q. And yet, you say that all the other producers in the field will pass that abandonment pressure average and go on producing at 100 percent?

A. No.

Q. In the year 1956?

A. I am saying that that is what the Panhandle Eastern will encounter if they do continue to produce at that rate and it would be my judgment, with the acreage which they hold, that they are going to be able to produce a large amount of that gas that I have shown.

Q. Have you made any investigation of the operating costs that would be required to be expended to produce the amounts of gas in the year 1956 which you show in Exhibit 134?

A. No, but I did assume that the selling price of that gas would be adjusted to take care of the increased operating costs.

Q. That is a kind of a general statement. Do you know what the selling price is going to be, down in the year 1956?

A. No, but if the companies continue to make money, it will be substantially higher than it is today.

Q. Can you give us the unit cost figure of producing gas for pipe line purposes in the year 1956?

[fol. 5282] A. No, sir.

Q. You are nodding your head. Would you mind answering so the record will show?

Mr. Culton: He is shaking his head.

The Witness: I did say, so I thought the reporter understood, "no, sir."

By Mr. Littman:

Q. I am sorry, I did not hear you.

You do not know that?

A. No, and if anybody did, he does not have to worry about the future because he can set up a tent and really make a good living.

Q. But that is one of the things that it would be important to know in order to make an accurate estimate, an accurate forecast, of the production of this field. Is that right?

A. That is correct.

Q. And the effect of your having included a rate of production from this field, or a rate of withdrawal from this field, for all producers other than Panhandle Eastern, at 100 percent full-blast right straight down through the years and through the year 1956, has the effect of shortening the life of the Panhandle Field, according to your estimate, and giving you the remaining 15-year life of Panhandle Eastern, in the Panhandle field does it not? [fol. 5283] A. It would not greatly affect the 15-year period or whatever it is, I do not know whether it is 15 or 17, without counting on here, but what I am saying is that if the other companies discontinue their estimated rate of withdrawal as shown on Exhibit 134, that we will immediately take advantage of it and withdraw at a greater rate just as long as we can continue to take gas at pressures which will be about the same as those shown.

Q. If the takes of all companies decrease at the same rate as Panhandle Eastern's takes, the amount Panhandle Eastern Pipe Line Company would get would be increased over that shown in Schedule 5 and in Exhibit 131, and the economic length of life increased, is that right?

A. Yes, that would suit us very well, too.

Q. Now, this so-called inability of Panhandle Eastern to produce any more than 11 percent of its peak-year production down in 1956 is not because of any inferiority on the part of Panhandle Eastern's acreage, is it?

A. No, it is due to two things: One is that we will have been taking, we hope, at a greater than the average rate of withdrawal for the entire field; and the other is that we will not be forced to operate under those conditions.

We can move up where we will be able to produce gas for less money.

Q. As a matter of fact, you agree with the testimony of [fol. 5284] other company witnesses, do you not, that Panhandle Eastern's acreage is located in the better portions of the Panhandle Field?

A. I agree with whom?

Q. With Mr. Smith, I believe he testified to that.

A. I thought you said other companies—

Q. (Interposing) Other company witnesses. I meant other witnesses of Panhandle Eastern.

A. Yes, I think our acreage is better than the average of the field.

Q. And the open flow of Panhandle Eastern's wells, on the average, is considerably higher than the wells of other companies operating in the field, is that right?

A. Yes. I do not go a great deal on open flow, because there have been a number of our wells acidized which have not been acidized by the other companies, but the ability of our wells to produce gas, I think, is better than the average.

Q. You testified that the Panhandle Field would not be "like a one-horse shay." That is to say, it would not meet with sudden death, is that right?

A. That is right.

Q. Now, that is only, however, as far as Panhandle Eastern Pipe Line Company is concerned, is that right, Mr. Hinton?

[fol. 5285] A. No, I do not believe you could say that is right. I believe I have testified that I think there is going to be a number of companies continue to take gas for years after the major pipe line companies cease to take gas from that field.

Q. Let me read you something you wrote in Exhibit 42, and ask you whether you still are of the same opinion.

A. What page?

Q. Starting at the bottom of Page 6 of Exhibit 42:

"Looking forward to the time when it will not be economical to supply a very large percentage of its market requirements from its reserves in the Panhandle Field, the Company must be pursuing a policy of developing its reserves in the Hugoton Field so that adequate production will be at all times available to supply the market. The Panhandle Field will not be a 'one-horse shay'. It will not suddenly cease producing but, in my opinion, its decline in productivity will be at an ever-increasing rate."

Is that a correct statement?

A. That is a correct statement.

Q. Well, you have not indicated in your Exhibit 134 a "decline in productivity at an ever-increasing rate" with respect to any of the other companies that are operating in the Panhandle Field beside Panhandle Eastern?

A. Yes, I have.

Q. Where?

[fol. 5286] A. Because if it were not for the fact that they are carrying on intensive drilling campaigns at this time and will continue to do so, I would have dropped off their deliverability much sharper than I did, just about the same as I would a company like our own which is practically fully developed at the present time.

Q. Mr. Hinton, you did not drop anybody's deliverability anywhere in Exhibit 134, did you?

A. That is what I was saying.

Q. Did you or did you not?

A. I dropped off Panhandle Eastern's.

Q. That is what I mean. In other words, you did not drop anybody's deliverability in the Panhandle Field through any of the years, other than Panhandle Eastern, did you?

A. That is right, but I would, if I would happen to know that they were fully developed at this time, because I would know that it would no longer be possible for them to drill additional wells.

Q. You kept everybody else going on producing in this field through the years way down to 50 pounds rock pressure, and lower, at 100 percent, substantially, of their peak year's production, did you not?

A. Yes, and I think that can happen.

Q. But you do not think it is within the realm of reasonable probability that anything like that will happen, do [fol. 5287] you, Mr. Hinton, really?

A. I believe it will be pretty close, and I can tell you why, if you want me to.

* * * * * * * * *

[fol. 5295] Q. Mr. Hinton, do you recognize, and are you familiar with, the figures shown in Exhibit No. 138 for identification?

A. I recognize, and I am familiar with, the source. As to the accuracy of the figures, I have not checked them.

Q. You can say, subject to check, that these figures have their origin in the Annual Reports of the Texas Railroad Commission for the Panhandle Oil and Gas Field, is that correct?

A. Yes.

Q. Now, you will observe that in the first two columns on the left side of this exhibit, No. 138, we have five periods.

Now, do you recognize these periods as embracing certain of the periods included in your table on Page 10 of Exhibit 42?

A. I do.

Q. And am I correct in stating that Exhibit No. 138 shows the periods beginning August 1, 1938, and ending August 1, 1940?

[fol. 5296] A. Yes.

Q. In other words, this table does not show the first period that you show in Exhibit 42 on Page 10, does it?

A. That is right.

Q. That is the period you did not use in your study?

A. Yes.

Q. Now, you will observe that we have taken your two-year period which is shown in the last line of the table on Page 10 of your Exhibit 42, and we show that 24-month period in two separate yearly figures, do we not?

A. Yes, you include the pressure data which was obtained midyear, 1939, which I neglected to use, due to the explanation which was read from the record of the Railroad Commission Report.

Q. In yesterday's session, you read from the Texas Commission's 1940 Report the explanation of the reasons why you did not use the 1939 pressure data?

A. As requested to do so by you.

Q. Well, does that statement which you read into the record fully describe the condition, and give the reasons for your failure to use the 1939 pressure data?

A. Yes, but without that, I would have been inclined to have discarded it after the 1940 data was available, due to the fact that it was so far out of line from the field trend.

Q. Do you mean you would not have used the 1939 data [fol. 5297] even if you had not known of the details which you read from the Commission's Report yesterday?

A. I would have shown it, but I would have questioned it just the same as I do question it.

Q. Have you ever made any calculations to ascertain whether the effect of the situation which you read from the Commission's Report would produce any such result as that shown in here for the pressure decline in pounds for the total field for the last period?

Now, that is the figure shown on the extreme right-hand side, on the bottom line.

Mr. Culton: Before you go any further, I wonder if you really appreciate the fact that you do not show any of the so-called "casing head gas" at all on here, which enters into the pressure decline just as much as the other, particularly in view of the fact that the Railroad Commission in its Reports has referred to the fact that in 1934 and 1935 particularly tremendous volumes of gas were popped into the air as so-called casing head gas?

Mr. Littman: The Texas Railroad Commission does not include casing head gas, does it?

The Witness: No—

Mr. Culton: (Interposing) It does in computing the pressure decline. In your Report, you will notice in 1939 and 1940 they give you the amount of casing head gas pro- [fol. 5298] duced after they started measuring it.

Mr. Littman: The witness says what to that?

The Witness: I do not believe that is correct, because the casing head gas that they refer to is the processed casing head gas.

Mr. Culton: I say that that is measured.

The Witness: Yes, and I know no Commission that functions that gives consideration in their reports to any other than metered gas.

Mr. Culton: That is what I was getting at. There is metered casing head gas, because this says, "dry gas production."

By Mr. Littman:

Q. Do you know, Mr. Hinton, whether what Mr. Culton says is a fact?

Mr. Culton: Let's get the records. We do not want to be starting here on something that has an erroneous idea.

I think, if you will get the 1939 and 1940 Reports, you will see, as to each of those fields, they say how much casing head gas was produced.

* * * * * * * * *

[fol. 5299] By Mr. Littman:

Q. And the pressure decline pounds, subject to check, for each of the three fields shown, to-wit, each field, west sweet field and west sour field, and total field, are the figures which were used by the Texas Commission, are [fol. 5300] they not?

A. Subject to check, I think they are.

Q. Now, am I correct in understanding that the figures shown in the column headed, "Pressure Decline Pounds" in each of the four columns thus headed, are the figures for each of the fields and for each of the years which you used in your table shown on Page 10 of Exhibit 42, is that correct?

A. No, I used the pressure decline figures for the total field and did not apply the east or the west sweet or the west sour pressure averages.

Q. Well, am I correct in stating that the pressure decline figures shown at the extreme right-hand column of Exhibit 138 are the same ones that you used in your table on Page 10 of Exhibit 42?

A. If they are found to be in agreement with the Railroad Commission Report, when checked, they are.

Q. Well, you can see for yourself, can you not, from Page 10 of Exhibit 42, that they are the same figures, except that we show, in Exhibit 138, a separation of the final two-year period in the two one-year periods?

A. They agree in all cases except for the two-year period, during which period your figures show a total pressure drop of 19.33 pounds, while those on Page 10 of Exhibit 42 show 1935.

Q. Well, with that exception, they are the same as [fol. 5301] those which you used in Exhibit 42, Page 10?

A. Yes, that is correct.

Q. Now, we have shown in this table, with respect to pressure decline pounds, the build-up of those total figures

as between the east field, the west sweet field and the west sour field, have we not? A. That is right.

Q. Now, with respect to the production, the total production shown for each of the three fields does not equal the total of your production from the entire field, is that correct? A. No, it does not.

Q. And the reason is simply because, as Mr. Culton has indicated, you added certain estimated figures to those of the Railroad Commission, is that correct?

A. That is correct.

. . . . . .

[fol. 5305]

C. H. HINTON, a witness, having been previously duly sworn, resumed the stand and testified further as follows:

Cross-Examination (Continued)

By Mr. Littman:

Q. Mr. Hinton, have you had an opportunity to check Exhibit No. 138 for identification with the annual reports of the Railroad Commission of Texas? A. I have.

Q. Are the pressure decline figures shown in this exhibit for each of the three fields, to-wit, east field, west sweet field, west sour field, and for the total field, correctly recorded on Exhibit No. 138?

A. I believe they are substantially correct, yes.

Q. And am I correct in stating that the pressure decline figures over on the extreme right-hand column of Exhibit No. 138 for the total field are the result of the weighting of the pressure decline figures separately shown on this exhibit for the three fields?

A. Well, I did not calculate those across by percents. Just checking the amounts shown in the Railroad Commission reports, I find them to be correct for the total field. [fol. 5306] Q. Now, am I correct in stating that this exhibit shows the production of dry gas for each of the periods shown and in the amounts shown as recorded by the Texas Railroad Commission?

A. The amounts shown for dry gas only are substantially correct.

Q. In other words, this Exhibit No. 13 does, in your opinion, and from your check, represent that which it purports to represent?

A. Yes, I would say that it does. It shows the weighted average pressures and the total dry gas withdrawal.

Mr. Culton: Is the dry gas what causes the reduction in pressure altogether?

The Witness: No.

By Mr. Littman:

Q. Mr. Hinton, will you please refer to your Exhibit No. 43. Your Schedule No. 3 in that exhibit contains your estimate of operation and maintenance costs west of Liberal for the Panhandle Field under the basic load and for the Hugoton Field under the basic load, does it not?

A. That is correct.

Q. And Schedule 4 of that exhibit shows your estimate of operation and maintenance costs west of Liberal in the Panhandle Field, predicated upon the estimated future load, which load was estimated by Mr. Morton and also contains similar figures for the Hugoton Field, does it not? [fol. 5307] A. That is correct.

Q. What is the source of the figures shown in Schedules 3 and 4?

A. The accounting records for the year 1940; accounting records for the first six months of 1941, with an estimate for the last six months of 1941; and from '42 through the year '46, they are estimated operating and maintenance costs.

Q. Were the estimated amounts determined by you?

A. Yes, in conjunction with the various superintendents employed in the different departments shown here and the addition of man hours was determined by using that method; that is, I spend during the year a good deal of my time in the field, and several days a year, I will take days and ride with the operating men in each of these departments and I am, I believe, quite familiar with what is going on in the field but not depending entirely upon my own judgment without going to the men who are operators of these various departments to establish the amounts used.

Q. Do these figures show all of the costs incurred by Panhandle Eastern in connection with the production and transmission of these amounts of gas, as far as Liberal compressor station? A. No, they do not.

Q. What costs do they not include?

[fol. 5308] A. Executives' salaries and Kansas City office expense, which might be properly allocated to this portion of the system.

Q. Well, it does not include anything for depreciation, does it? A. No.

Q. In other words, you exclude depreciation from these tables and you also exclude another form of depreciation which is commonly called depletion, do you not?

A. Yes, that is right.

Q. And am I correct in understanding that you do not include in these figures the expense of gas purchased from vendors? A. That is correct.

Q. So that is also excluded?

Mr. Culton: But you do include royalties?

The Witness: Yes, royalties are included, but the gas purchase expense is not included.

By Mr. Littman:

Q. And, of course, you do not show anything in these exhibits reflecting the return on investment, do you?

A. No, sir. There is one purchase cost that is included, and that is the cost of measuring the gas which is purchased. That is the only one.

Q. That is, the expense of measuring the purchase gas [fol. 5309] is included in the figures in Schedules 3 and 4?

A. Yes, sir, but the purchase price is not included.

Q. Now, have I named all of the exclusions? In other words, what I am undertaking here to do, Mr. Hinton, is to make certain that I know precisely what you have included in your Schedules 3 and 4.

If I have omitted anything, I wish you would tell us about it.

A. Perhaps it would be better to enumerate what is included, and then we would have a double check on any possible omissions.

Q. Very well.

A. The information included on Schedules 3 and 4 of Exhibit 43 includes the expense required to maintain and operate the necessary activities of the portion of the system south and west of Liberal compressor station.

Q. What is the purpose of these schedules?

A. The purpose of them is to give us an idea of what it is going to cost to operate through these years.

Q. In total? A. In total, for this portion.

Q. That is, for the periods shown in Exhibit 43?

A. Yes, that is right.

Q. To be more exact, for the periods shown in Schedule 3 and 4 of Exhibit 43? A. That is right.

[fol. 5310] Mr. Hinton, I refer you to Exhibit No. 57, which was presented in this proceeding by Panhandle Eastern Pipe Line Company witness, Mr. Watkins.

Do you have a copy of that exhibit?

A. No, sir, I have never seen it.

Trial Examiner: You may use mine.

The Witness: Thank you.

(A document was handed the witness.)

By Mr. Littman:

Q. This exhibit is entitled, "Panhandle Eastern Pipe Line Company and Subsidiary Companies—Statement of Gas Purchased Period from April 1, 1932 to June 30, 1941." I note that in Column C is shown the average cost per M.c.f. of gas purchased by Panhandle Eastern in the Amarillo Field, is that right? A. Yes, sir.

Q. Do these figures look right to you?

A. Yes, I would say that from 1937 on, I am quite positive that they are within one-tenth of one cent of being correct per M.c.f.

Going back beyond that, I would have to do a little checking, because I cannot remember much further than that.

Q. Well, we are not interested at this time in going back that early, but I would like to call your attention to [fol. 5311] the figure in Column C showing the average cost in the Amarillo Field for the year 1941, that is, the first six months of 1941, and which is shown in Line 14 to be 3.47 cents per M.c.f. A. Yes.

Q. Is that the amount which you understand to be the average cost per M.c.f. of gas purchased in the Amarillo Field by Panhandle Eastern?

A. Yes, it might be a little closer to 3.48, just offhand, but I know it is one or the other.

Q. Now, is that the amount which you expect Panhandle Eastern Pipe Line Company to pay for its gas which it expects to purchase from its vendors in the Panhandle Field, throughout the periods shown in your Schedules 3 and 4, to-wit, 1941 through 1946? A. I am sorry—

Trial Examiner: Read the question.

(Whereupon, the pending question was read by the reporter.)

The Witness: Yes, I believe that will be correct.

However, our gas purchase contract with the Shamrock Oil and Gas Company provides that we will pay them any amount for royalty that is in excess of four cents per M.c.f. providing the weighted average purchase price of the field is increased above the average of 4½ cents, but I believe that that does not take effect the next time until 1946. It will be in the year 1947.

[fol. 5312] By Mr. Littman:

Q. Well, inasmuch as the Shamrock contract won't be affected by the provision to which you have referred until it is effective in 1947, the answer to my original question would be that the amount which Panhandle Eastern expects to pay for its gas purchased in the Panhandle Field from 1942 through 1946, both inclusive, is the 3.47 cent figure per M.c.f. to which we have referred a moment ago?

A. I believe that is correct.

Q. Now, in Column F of Exhibit 57 is shown the average cost per M.c.f. of gas purchased by Panhandle Eastern in the Hugoton Field for the years 1932 through the first half of 1941, is that correct?

A. They look to be approximately correct to me. I would have to have those files that I handed to Mr. Goodman the other day to be able to check these last few years.

Q. Well, they look substantially correct, do they not?

A. Yes, they do.

Q. Now, I see that Line 14 of Column F shows Panhandle Eastern has paid an average of 4.26 cents per M.c.f. for gas purchased in the Hugoton Field during the first six months of 1941; is that correct?

A. That is substantially correct.

[fol. 5313] Q. And is that the amount which you expect Panhandle Eastern to pay for gas expected to be purchas-

ed in the Hugoton Field from June 30, 1941, through the year 1946?

A. I assume that that will be approximately the price, although the trend of this proration problem which we have on hand might have some effect on that price.

Q. There might be some variation. In your opinion, based on your judgment at this time, you would expect the price to remain the same throughout the period which I just mentioned?

A. Yes, substantially the same.

Q. Mr. Hinton, how many operating men were employed in 1939 in connection with the part of the system west of Liberal station?

A. Do you mean regular employes, or both regular and casual employes?

Q. Well, suppose you give us both.

A. I am not sure I can give you the casual.

Q. The regular employee is more important for purposes of our discussion, but if you have the casual-employee list, I will appreciate it.

A. I do not think I do, and I am not sure I have the regular, because I took that from the records and I do not think I put it down in all cases.

I took the number of men as a base and estimated the [fol. 5314] number required in addition to what we were using, and I am not sure that I have that, but that can readily be furnished because it is available on the accounting records.

Q. I might state that, while you are looking through your work papers, I would also like to have the same information for the year 1940 and for the year 1941.

A. I am going to have to get that from the records at the office. As I thought, as I went through these various operations and talked to the different superintendents, we talked in terms of the number that would be required to be added, and I did not put down the number in each case that we were using at that time, just thinking that we had our base figure and we would probably not need to refer back to that, and we added man-hours to the base rather than detailing the base as to the number of men employed at that time, but that information can be readily gotten from our records.

Q. Well, perhaps it won't be necessary to get it if you do not have it available at the moment. Will you state what was the base year that you used for the purposes of this study?

A. 1941, the first six months, and that weighed back against the year 1940.

Q. How many additional men do you propose to hire in each of the years subsequent to your base period?

A. In the Transmission Department, which takes care [fol. 5315] of the pipe line, in the year 1942, we will add three men; in the year 1944, we will add two men.

In the measurement and gas purchase operations, in the year—

Q. (Interposing) Just a minute. You just gave us 1942 and 1944. How about the other years?

A. We do not anticipate adding men in those years.

Q. In other words, where you are silent with respect to any particular year, you mean that you are not going to add any additional men?

A. That is correct.

Mr. Culton: That is, over the preceding year, no additional men over the preceding year?

The Witness: That is right.

By Mr. Littman:

Q. Let me ask you one thing further, to make certain we understand your testimony as you go along.

You just stated you are going to add two men in 1944 and three men in 1942. Does that make five additional men in all, that is, additional over the base period?

A. That is correct.

Q. Very well.

Now, you were going to tell us about the maintenance department.

A. No, the measurement department.

[fol. 5316] Q. I am sorry, the measurement department.

A. In the year 1942, it will be necessary to use an additional meter man who will work part-time in the Oklahoma Field and part-time in the Kansas Field.

Mr. Culton: Pardon me, are you talking now just about the Texas end or the entire field? I was not certain whether I got his question.

Mr. Littman: Well, I think we ought to know that from this witness, and I also think we ought to know whether he is giving us the figures under the basic load or under the future load.

Mr. Culton: I was just trying to clarify the thing, so we will know exactly what inquiry you are making.

The Witness: I am taking them in the same sequence as you started out, that being the basic load.

By Mr. Littman:

Q. You are giving us the additional men that will be hired under the basic load for which field?

A. For the Hugoton Field is what I am starting on. I believe that is the first schedule that shows, is it not?

Q. The first schedule is the Panhandle Field.

A. I am sorry.

Q. Suppose we do this, suppose we take these matters up in this way:

Start with the Panhandle Field basic load, which is the [fol. 5317] first part of Schedule 3.

A. All right.

We are now going into the basic load for the Panhandle Field. The number of men that will be required over and beyond those working during the first six months of 1941 will be, for the year 1942 in the transmission department, two men, and that is all we expect to increase the transmission operating force in that field under the basic load through the year 1946.

The year 19—

Q. (Interposing) Suppose you give us the department first.

A. All right. The measurement and gas purchase operations for the Panhandle Field will show that an additional man will be added during the year 1943, and that is all that will be required in the measurement department through 1946.

In the compressor station operations—

Mr. Culton: (Interposing) This covers Hansford and Sneed only?

The Witness: This covers Sneed station, and it will take another operating crew of three men, which will be required as soon as the additional units are installed which are estimated to be installed during the year 1942, and that will be the only addition through the year 1946.

By Mr. Littman:

[fol. 5318] Q. May I ask you this question: When did you commence including the salary of these three men in your Schedule 3 for the Panhandle Field basic load?

A. I am in error on that, I believe—basic load—that should be 1945, instead of 1942, under the basic load.

I was thinking in terms of the future estimated load, and that will be reflected in the increase between 1944 and 1945, during which year the labor increases from $28,207 in 1944 to $35,707 in 1945.

Q. Just a minute, are you now speaking of the basic load in the Panhandle Field?

A. Yes, sir.

. . . . . .

By Mr. Littman:

Q. I cannot find those figures in Schedule 3, Page 1.

A. No, they are not in there. That is a total of all operating costs.

Mr. Culton: The figures are in the working papers, though?

The Witness: Yes, they are.

Mr. Wheat: And they are in the exhibit, are they not?

[fol. 5319] The Witness: Yes.

Mr. Wheat: But not separately stated?

The Witness: Yes. This is a total, shown in the exhibit, but I am reading from the detailed figures.

By Mr. Littman:

Q. The increase is reflected in the total figure shown in your exhibit?

A. Yes, that is correct.

Q. As of what day in 1945 do you commence to include the salaries of these three additional men in the compressor department?

A. When one is making an estimate of this sort, he does not think in terms of any certain day. He thinks in terms of a year.

Q. Well, Mr. Hinton, I assume that you have salaries in here for various periods, and I merely ask you what periods are shown in this schedule?

A. That will be for the calendar year 1945, because we do not know exactly upon what day the addition will be completed, but the amounts reflected in here which are, of course, estimated, are based on starting for the calendar year 1945.

Q. I see.

A. The reason I answered it that way, I did not want to tie myself down to any day, although the figure is shown [fol. 5320] here for the calendar year.

Q. I want to know what your figures in Schedule 3 show, and you have answered that by saying that the salaries for these additional men are included as of the first of the year in which you mention they are to be employed. Is that right?

A. Yes, if that is satisfactory with you, the way I have answered it. I just wanted to be sure that I was not committing myself to say that I make an estimate five years hence and base it upon any certain day.

Q. Your figures reflect just that, though, don't they?

A. Yes, but I thought it might be a good time to explain that I could be wrong a little bit about what they do reflect.

Q. Well, I wanted to make certain I understood what your figures reflected.

Now, for instance, the transmission department, in which you stated a moment ago that three additional men were to be hired in the year 1942—you have included the sal-

aries of those three men for the entire calendar year 1942, have you not?

A. That is right.

Q. And the same is true of all of the figures which you are about to give me?

A. Yes, they are.

[fol. 5321] Q. Unless you state otherwise?

A. They are so shown, but estimated.

Q. You are not at all certain, however, that the additional compressor station equipment will be installed in the first of the year 1945, are you?

A. No, it may be installed by the middle of 1944, and it may be the middle of 1945; but, over the entire 5½ year period, the answer will be pretty close to the same, I believe, because some will be ahead and some will be late.

Q. Well, have you included the additional compressor station equipment in your itemization of capital additions required for the basic load in Exhibit 42, Mr. Hinton?

A. I should have.

Q. Where does it appear and under what year?

A. It appears at the top of Page 25 under Item D, "Install Two Additional 1300 Horsepower Units at Sneed Station with Additional Scrubber, Cooling Tower and Auxiliary Engine."

Q. And under what year have you listed that?

A. 1945.

Q. Now, will you proceed, Mr. Hinton, with the number of additional men that will be hired in each department in the Panhandle Field under the basic load?

A. In the Hansford Station, we are now operating six units and it is contemplated that two additional units will [fol. 5322] be installed during the year that the two additional units will be installed at Sneed, I believe.

I get those two, the estimated and the future, confused—no, we do not. We show no labor increase at all for the Hansford compressor station.

Q. Now, that completes the additional men for the compressor stations?

A. Yes.

Q. Under the Panhandle Field basic load and the total increase is, three men will be hired in 1945?

A. That is right.

Q. Very well. What is the next one?

A. The production department. Now, in the production department, we show that we will need extra casual labor, but do not expect to add but one additional man in the field.

Mr. Culton: That is, regular employee?

The Witness: Regular employee, and he will be added during the year 1944. There will be considerable of the casual labor which will be used during the years 1942, '43 and '44, which will be capitalized because it will be in conjunction with the drilling of new wells.

By Mr. Littman:

Q. Well, then, you have not included the casual employees in this study?

A. There is some reflection in the increased cost there [fol. 5323] that you will note under operations labor and under maintenance labor. You will notice that we do have an increase, but that we only anticipate the addition of one regular employee.

Q. I do not know that I am clear on what you are attempting to convey. Tell me whether your figures for the production department reflect anything more by way of labor than the salary of the one man that you mentioned to be added in 1944?

A. Yes, they do. There is some slight increase. It is very slight.

Q. How much does it amount to?

A. I do not recall day by day, because it is prorated between the different operations labor and maintenance labor here, but it does not amount to a great deal because these men will probably only be used for two or three months out of the year.

Q. Now, you are referring to casual labor?

A. Yes.

Q. Is that the labor which cost is expected to be capitalized?

A. Nothing will be capitalized that is reflected on this sheet of the casual roustabouts.

Q. Well, you just stated the amount of casual labor increase would be slight.

[fol. 5324] A. That is right.

Q. I would like to have a general idea of the amount in dollars, because your definition of "slight" may not be the same as mine or someone else's.

A. Well, by "slight", I mean somewhere between $500 and $1,000, and that is not slight to me.

Q. Well, then, it is not slight?

A. But to the company, I feel that it would be.

Q. Now, do you mean $500 to $1,000 a year?

A. Yes.

Q. On and after what year?

A. That will be reflected through all of the years. I mean, you go out and you hire a man to work for a month or two months, and it is reflected in these figures here (indicating). Do you understand what I mean?

Q. Can't you tell me how many dollars is reflected in the figures shown in Schedule 3, Page 1, for casual labor, so we won't have to guess about it?

A. I can, by going back to a stack of detailed sheets which were worked on about that thing (indicating), and getting it out, but it didn't amount to enough that I felt it was necessary to bring those here.

The basis for these figures—

Mr. Culton: (Interposing) Your pointing indicated about six or eight inches when you said that the sheets [fol. 5325] were "that" thick.

The Witness: I do not believe they are over 2½ or three inches, but they are 14-column paper. There was a tremendous amount of work to get those figures, and I did not include all of them in my working papers.

I just tried to explain that we would have some slight additional expense. The total increase that we have estimated for this period is very, very little.

By Mr. Littman:

Q. That is for the production department?

A. Yes, for the production department.

Q. The $500 to $1,000 per year which you just mentioned for casual labor represents an increase in each year over the basic year, is that right?

A. Yes, and not over the previous year.

Q. And that will start in what year?

A. That will start, in all probability, next year, and again the conditions have changed somewhat since we made up this estimate because we have been revamping our well heads under our maintenance accounts; and we have redesigned our well heads, and if it is possible to get material, we will need more casual labor than if it is not possible and, therefore, the casual labor will be governed somewhat by the material situation.

Q. Well, does that complete the production depart-
[fol. 5326] ment additional labor?

A. Yes, that does complete the production department.

Q. Will you please continue?

A. The next department is the land and lease department. It is carried on our books as the land department, and the amounts for labor remain the same through the year 1946.

Our royalties show an increase—

Q. (Interposing) Let's just confine ourselves to the lands for the present, Mr. Hinton.

A. All right.

Q. I think it will be less confusing when we read the record.

A. That is all on the labor for the land department which will be used in the Panhandle Field.

Q. Under the basic load?

A. Under the basic load.

The dehydration plant located at the Sneed station shows no substantial increase for the period ending with 1946.

Q. Just a few dollars?

A. Just a few dollars.

Q. And, of course, that does not contemplate the hiring of additional labor?

A. That is correct.

Q. Now, does that complete the additional labor re-
quirements under the basic load?

[fol. 5327] A. For the Panhandle Field?

Q. For the Panhandle Field.

A. Yes, it does.

Q. Now, will you give us the comparable figures for the Hugeton Field under the basic load which are reflected in Page 3 of Schedule 3 of your Exhibit No. 43?

The Witness: The estimated increase in the operating personnel for the transmission department, Hugoton Field, under the present load, would show that we will need three additional men in 1942 and two additional men in 1944.

Mr. Littman: Will you please read that answer?

(Whereupon, the last answer was read by the reporter.)

The Witness: For the measurement and gas purchase operations for the year 1942, we will add one man in the Hugoton Field, Oklahoma, and that will be all, in the main-
[fol. 5328] tenance department, for the years to 1946, I believe.

For the production department in the Hugoton Field—

By Mr. Littman:

Q. Just a minute. Would you mind giving us the compressor department, which appears to be next on your list?

A. There being none in the Hugoton Field under the basic load, it will not have any.

Q. Yes, you have blanks going all the way across, haven't you?

A. That is right.

Q. Now, the next, you say, is the production department?

A. Yes, that is right, and other than casual labor, we do not expect to add more men for the operation.

However, we have cut that pretty thin because, under the basic load, we are attempting to use a combination meter man, that is, a meter engineer, and use that man for a chart changer, in order to operate that as cheaply as possible.

Q. How much of an increase do you expect in casual labor over the base year?

A. There will be some increase in casual labor amounting to approximately $250 a year.

Q. All right. What about the land and lease department?

[fol. 5329] A. For the land and lease department, we are contemplating that there will be some required labor cost, and that is reflected by the figures shown, an increase

of from an estimated $5,000 in 1942 to an estimated $6,000 in 1946.

That way that will probably be carried on will be that there will be a lease man that will be sent in to this territory, part-time, whenever the regular lease employees are not able to take care of all of the necessary details.

. . . . . .

By Mr. Littman:

Q. Am I to understand the increase over the basic load in the lease and land department is represented by the salary of a part-time employee in the years 1945 and 1946?

A. That will be in all years. In 1943, we believe that it will not be necessary, probably, to spend so much time.

The figure of $6,000 not only reflects the amount of time that would be used, but there was some allowance made in there for a salary increase, after talking to the head of this department.

Q. Now, that completes the increased labor under the basic load for the Hugoton Field, does it not?

A. Yes, sir.

[Fol. 5330] Q. Will you state the increase for the Panhandle Field under the estimated future load, which is reflected in your Schedule 4, Pages 1 and 2?

A. The estimated labor cost, operations and maintenance, for the transmission department, will show there will be a requirement of three additional men for the year 1942, and it is believed that those three men will be all that will be necessary through the year 1946.

The estimated labor requirement increase for the measurement and gas purchase operations will show that, in 1943, there will be a combination meter man and chart changer added, which will be charged to measurement.

Q. That will be one man?

A. That will be one man, and that will be all that will be added through 1946, as we will only have an additional fifteen wells to look after.

Q. And that addition is true, under both basic and anticipated loads, is it not?

A. Yes, but there is a difference in the operations to some extent, which I do not believe that I gave much consideration to, but it would be justifiable to increase the measurement labor operations for the estimated load slightly over the basic load.

Q. Does that complete the measurement department?

A. Yes, sir, for the Panhandle Field, under the esti- [fol. 5331] mated load.

Q. Estimated future load?

A. All right, estimated future load.

Now, we will go to the compressor station located at Sneed and find that we add the new operating crew in the year 1942, which will be required to operate the additional 2600 horsepower added.

Q. That crew consists of how many men?

A. Three, and an auxiliary engineer.

Q. That makes four men? A. Yes.

For the compressor station at Hansford Station, the operating labor remains about the same, because it is possible for the present crew to operate the additional units.

The labor for the production department in Texas shows that one field man will be added in 1944, and that will be the only regular employee. Some casual labor is reflected.

Q. But not very much? A. Not very much.

For the land department under the future estimate load, we show a constant figure throughout the years, no increase in the labor.

The dehydration plant shows an increase of approximately $2,000, which is accounted for by the number of —wait a minute—we are just talking about the labor, and the labor will remain constant for the dehydration [fol. 5332] plant.

That completes the Panhandle Field under the estimated future load.

Q. Now, will you give us the comparable figures for the Hugoton Field under the estimated future load?

A. Under the estimated future load, the transmission department will require one subforeman and four men in the year 1942. In the year 1943, we will add one-half man and, in 1944, one-half man; in 1945, one and one-half man and, in 1946, we add another half-man.

Q. What do you mean by "half man", a part-time man?

A. No, I mean a man who will probably start to work about the middle of the year, at the time of the year that we are trying to catch up on our painting of the meter runs and our buildings, and he will be there for the winter operation.

The next year, why, there will be another man that will be taken on during the summer time; I mean for a half-year period rather than a half man.

Q. What is the number of men for 1942?

A. There will be one subforeman.

Q. One subforeman? A. Yes.

Q. Any others? A. Four men.

Now, for the measurement and gas purchase operations [fol. 5383] in the Hugoton Field, 1942, we put on a combination meter man-chart man, and he will be on the measurement payroll altogether. Sometime during the year 1945 or '46, there will be a man put on.

The way we made this estimate was to go back and determine how many meters it was possible for one man to take care of, and then we showed that the increase in labor was governed by the number of meters, so the exact time that this will happen will be pretty well substantiated by the number of meters which will be installed upon those dates.

Q. Are you adding a man in 1945 for that purpose?

A. Well, I would say that between 1944 and 1946, we will have added a full-time man and it may be necessary that he will be another combination man.

Q. Does that complete the measurement department?

A. Yes.

Now, for the Hugoton station, commencing operations in 1946, it was necessary that we make a pretty far-fetched estimate on this, because we do not know what the conditions will be out there, but we just based it on what the

other stations were costing as nearly as we could and used common judgment and put a figure of $10,000 down for labor. That is a very round figure.

Q. How many men does that provide for?

A. That will be one chief engineer and four men.

[fol. 5334] Q. How about the production department?

A. The production department contemplates the addition of one man in 1942; one man in 1944, and one man in 1946.

The land department will carry on operations under the future estimated load in about the same manner as they will under the basic for present load.

Q. In other words, there will be no additional labor hired under either load?

A. No, it will be just some help-out men coming in at various times.

Q. Do you know what the average salary was for the employees in the base year?

A. No, I do not, because the labor costs were taken from the records as a base. Now, if I had the number of men that we used in each of those departments, if I had that detail data here, why, it would be a simple matter to divide it into this labor cost and tell you, but I am not able to tell you the average salary of the men at that time.

Q. Can you tell us the average salary of the men that you added in the years subsequent to your basic year, 1941? A. Yes.

Q. All right. Will you give that to us?

A. I thought I could do it by merely subtracting here. [fol. 5335] In the production department, I see that I am not able to because we have estimated, in all cases, the amount of our regular employees that will be used in the drilling of wells and that amount will be capitalized and not shown as an operating expense.

* * * * * * * * *

[fol. 5337] By Mr. Littman:

Q. Mr. Hinton, you show throughout Schedules 3 and 4 certain items of maintenance under the transmission department, the measurement department, the compres-

sor station department and production department, do you not? A. Yes.

Q. Now, that item of maintenance for each of the departments named includes materials as well as labor, does it not? A. That is right.

[fol. 5338] Q. Will you state how you arrived at the amounts included in your schedule for materials which are included within the meaning of the term "maintenance"?

A. Yes. We took the previous costs and after giving everything that we felt was due consideration, we adjusted those costs for each year which could be expected that would cover the same items as were included in the base figure which we used.

Q. You did not use any particular ratio——

A. (Interposing) No.

Q. (Continuing)—in arriving at the materials cost for maintenance?

A. No, sir. By talking with the field men, the superintendents, we knew that there would be certain old wooden gate valves boxes that would have to be replaced and there are innumerable items that go in to make this estimate.

Q. Now, what did you include within the meaning of the term "maintenance"? Give us a number of items which you have included as maintenance under the transmission department, for example.

A. Well, I would say that one of the maintenance costs is incurred in the maintenance of the property which shows above the ground, although that is a very small portion of the system.

Now, that is in the gathering system. We have a meter [fol. 5339] at each well. It is necessary that this meter be housed. We have the meter run to keep looking in first-class shape and they all do look just that way.

We are forced at various times to do considerable work on our meter houses, due to the fact that that is a cattle country, and they rub against the houses, and during the past two or three years, it has been necessary to build fences around a great many of these meter houses, and that has been a maintenance cost.

Then, on a gathering system, it is necessary that the pipe line system be fully equipped with drips and syphons to enable the blowing out of water and gasoline which collects in the line, and each of those drips have two gate valves and it is necessary that the crew go around and see that those gate valves are properly cleaned and lubricated before the winter operation starts.

We have found in several cases in the Hugoton Field, that it has been necessary to replace pipe between the well head and the meter run, and we have done considerable work on the grading of the ditch in which the pipe is located so that it will drain to a drip.

Now, that is all termed "maintenance labor," and that is only a small part of the items which could be named.

Q. You considered the replacement of the pipe between the well and the meter as an item of maintenance? [fol. 5340] A. Yes.

Q. What is the distance of that pipe?

A. From 50 to 70 feet, usually.

It does not all have to be replaced. It develops leaks and it is stripped and examined, inspected, and the part is replaced that appears to be faulty.

Q. Well, in determining your item of maintenance, both as to materials and labor, did you follow the Federal Power Commission's Uniform System of Accounts?

A. Precisely.

. . . . . .

[fol. 5341] By Mr. Littman:

Q. Will you please refer to Page 1 of Schedule 3 of Exhibit 43? I note that in Line 23, which shows the expense for royalties, that the amount sharply increases from 1940 to 1941, from $101,182 to $132,828, respectively, and that there is a rather substantial increase in each succeeding year through 1946.

Will you explain the reasons for those increases?

A. Those royalties are in proportion to the amounts of gas which were taken during the year 1940 and 1941, and those that we estimate for the years 1942, 1943, 1944,

1945 and 1946, and the price is governed by the proportion of each priced gas that we expect to produce to make up that total amount.

The sharp increase from 1940 to 1941 reflects not only an increase in gas but a change in the royalty rate in the Panhandle Field from four cents per M. c. f. to 4½ cents.

Q. In other words, there is an increase of one-half of one cent per M. c. f. for gas produced by Panhandle Eastern in the Panhandle Field?

A. The royalty portion of that gas, yes, sir.

Q. That is from 1940 to 1941?

A. That is correct.

Q. Now, the 1941 figures reflect the increased royalty rate?

[fol. 5342] A. Yes.

Q. And that is true, in so far as the books of the company are concerned, too?

A. That is correct.

Q. And all increases from January 1, 1941, to the end of 1946 are the result, not of increases in the rate of royalty, but in increased amounts produced by Panhandle Eastern in the Panhandle Field. Is that correct?

A. That is correct.

Mr. Culton: In other words, it reflects the changes in percentage between your purchased gas and your produced gas?

The Witness: That is right.

By Mr. Littman:

Q. Another way of saying it is that the unit cost per M. c. f. of royalties does not change from January 1, 1941, through 1946?

A. I am not so sure [than] January, 1941, is the correct date for that. I don't believe that that increase in royalty became effective until sometime during the latter part of January rather than the first of January.

Q. 1941? A. 1941.

Q. While on the subject of royalties, the increase in royalties reflected for the Panhandle Field under the esti-[fol. 5343] mated future load for the years 1941 to 1946, inclusive, is occasioned by reason of the increased amount of production in each year?

A. You are referring to Page 1 of Schedule 4?

Q. That is right.

A. Yes, that is correct.

Q. Now, what about the Hugoton Field figures that are shown in Schedules 3 and 4? Do your figures show or reflect any increased rate of royalties throughout the periods shown from 1940 to 1946, inclusive?

A. No, not on royalty. That is based entirely upon the amounts of gas which we expect to produce from our wells during those years.

Q. In other words, no increase in unit cost, in so far as royalties are concerned, throughout the periods shown for the Hugoton Field?

A. That is correct.

Trial Examiner: Mr. Hinton, may I ask whether, at some point in these exhibits, the average cost of production at the well head is shown?

The Witness: It is not shown in these exhibits.

Trial Examiner: It has not been computated at any point, and you have not covered that in your testimony, I believe?

The Witness: No, sir, I have not.

By Mr. Littman:

[fol. 5344] Q. These figures shown in Schedules 3 and 4 cover the costs which you enumerated earlier today, west and south of the Liberal compressor station?

A. That is correct. That portion of our system.

. . . . . .

[fol. 5350] By Mr. Littman:

Q. I call your attention, Mr. Hinton, to the item of gross production tax which appears in each of your Schedules 3 and 4 and which appears for the basic load on Page 2 of Schedule 3, in Line 8.

A. Yes.

Q. Will you explain why the gross production taxes in-

[fol. 5351] crease under the basic load in the Panhandle Field? A. Yes, just a moment.

Mr. Culton: It is, also, due to the change in the apportionment of the purchased gas and the produced gas, isn't it?

The Witness: We have a different gross production tax in each State, and I want to be sure that I am right before I go ahead. I mean a different type of a gross production tax.

The figure for the gross production tax, shown in Line 8 of Page 2 of Schedule 3, is increased in the amounts shown, due to the fact that the gross production tax in that State is based upon 5.2 percent of the value of the gas.

As we increase the amount produced, the gross production tax is, likewise, increased.

Mr. Littman: Will you please read the last answer back?

(Whereupon, the last answer was read by the reporter.)

By Mr. Littman:

Q. Are you referring to the State of Texas?

A. Yes, that is the Panhandle Field, basic load, Page 2, Schedule 3.

Q. Well, that isn't the only reason for the increase in total for each succeeding year, is it?

A. Yes. That rule applied to the amounts which we expect to produce through those years will get us the figure that is shown under Line 8 of this Page 2, Schedule 3.

[fol. 5352] Q. Oh, well, then the increase is occasioned by reason of the increase in production from your own wells in each successive year?

A. That is correct.

Q. And the increase does not, then, represent an increase in unit cost but an increase in over-all cost by reason of your production of a greater number of units in each succeeding year shown?

A. That is correct.

Q. Now, is that same condition true of your other schedules and your other bases, to-wit, Schedules 3 and 4?

A. For the gross production tax?

Q. Yes.

A. Yes, that is true.

Mr. Culton: There is another reason for the increase on the anticipated load, though, isn't there?

The Witness: Well, I believe his question was that it did not affect the unit cost of gas.

By Mr. Littman:

Q. That was my question. In other words, under the anticipated load, if I correctly understand what you are driving at, Mr. Culton, there will be still greater amounts of gas produced and, therefore, more units and, therefore, more total dollars?

A. That is correct.

[fol. 5353] Q. Now, I note that the item of delayed rentals decreases under both leads in the Panhandle Field and increases in the Hugoton Field.

Will you please explain that situation?

A. I would like to refer to this just a moment.

Yes, I will be glad to explain that. The delayed rentals are on the decline in the Panhandle Field, due to the fact that we are drilling,—we anticipate the drilling of acreage which is now held by delayed rentals.

As soon as the well is drilled, it is no longer necessary to pay that delayed rental, therefore, the total amount is reduced.

Q. And in what year do you expect to drill your last well in the Panhandle Field? A. 1944.

Q. No drilling after 1944? A. No.

Q. Why are you still paying delayed rentals in 1945 and 1946 in the Panhandle Field, Mr. Hinton?

A. Because we have under lease some State land on which it is necessary to pay a delayed rental after it has been drilled.

Mr. Culton: It is really a lease rental, rather than a delayed rental.

The Witness: That is right.

[fol. 5354] Mr. Culton: You have to pay a certain rental in addition to royalties?

The Witness: Yes.

By Mr. Littman:

Q. And is that entire amount represented by the $3,097 figure shown in Columns "G" and "H" of Schedule 3, Page 1?

A. If is not. That is the total cost of the lease rental which is required in addition to the drilling of the well, it is not as great as $3,097.

Q. Well, how much is it?

A. That is 25 cents an acre.

Q. Can you give us the total?

A. There are 1,921 acres in that lease. Do you want me to explain the rest of it?

Q. Yes.

A. The rest of the amount is due to the fact that we have some scattered acreage in the Panhandle Field which is not of large enough size to drill, but which we feel is of sufficient value to continue to pay those rents, because it has good trading possibilities.

By "good trading possibilities", I mean that that acreage may be exchanged to Northern Natural or Cities Service or Hagy, Harrington and Marsh, or some company that carries leases in both fields, whereby they would ex-[fol. 5355] change some acreage located in the Hugoton Field for the scattered acreage which we have in Texas which might be adjacent to a lease that they would develop.

Q. I believe you have not yet touched upon the subject of the increase in delayed rentals expense for the Hugoton Field.

A. I am sorry, I had forgotten that part of your question.

The increase in the delayed rentals in the Hugoton Field is accounted for by the fact that on the primary term of a number of a lease which covered a sizeable quantity of acreage, the rental was 25 cents per acre.

It is no longer possible, we find, to renew leases in the Hugoton Field for a delayed rental consideration of 25 cents per acre, therefore, the increase of these rentals reflects an increase from 25 cents to 50 cents an acre and, also, reflects a renewal benus which is becoming prevalent in that field.

Mr. Culton: In other words, you expect to be able to extend expiring leases by payment of those sums?

The Witness: Yes.

By Mr. Littman:

Q. Will you explain why your delayed rentals expense for the Hugoton Field is greater under the basic load than it is under the anticipated load for the years 1943 to [fol. 5356] 1946, inclusive?

A. Referring back to the capital expenditures shown under the basic load in Exhibit 42 for the years mentioned, you will find that we do not anticipate drilling the same number of wells.

The smaller number of wells which we anticipate drilling under the basic load means that we will be required to hold a larger number of acres by delayed rentals, thus holding up the amount shown under the basic load.

Mr. Culton: In other words, every time you drill a well, you stop delayed rental on 640 acres?

The Witness: That is right, unless it is State land.

By Mr. Littman:

Q. Mr. Hinton, there is an item on Page 3 of Schedule 3 in Column "E", Line 26, renewal bonus for the year 1943, in the amount of $49,111, a very great increase over the amount for the preceding year, 1942, which was $15,075.

Will you explain the reason for that sudden increase?

A. That is due to the fact that during the year 1933, we acquired a large amount of acreage, and this same amount of acreage expires in 1943.

Based upon the renewal bonuses that have been [being] paid in that field, that amount of expense was estimated to cover the number of acres that would have to be renewed during the year 1943.

[fol. 5357] Q. You wouldn't have such a large and sudden increase again for another ten years, would you?

A. That is right. Well, now, wait a minute. I can't say exactly because I don't remember whether through the years after 1933, we acquired any great amounts of

acreage in any of the years that might expire during any of those years after 1946.

Q. So that, if you reflected that sudden increase for the Hugoton Field for the year 1943 by reason of the renewal bonuses you would be, in a measure, distorting the unit cost for that particular year, would you not, because the amounts expended apply over the ten years, do they not?

. . . . . .

[fol. 5359] By Mr. Littman:

Q. Do you understand my question, Mr. Hinton?

A. I believe I do, and I would say that the only way to determine whether that should be applied that year would be to find out what the cost for the next ten years is going to be, and see if that was an approximate share; I mean, that you would have to prorate it over the ten years' period.

Trial Examiner: I was going to ask whether or not that would be governed to any extent by the Commission Rules.

Do you know, Mr. Littman?

Mr. Culton: I think it would, Mr. Examiner, and my understanding is that nobody has yet determined, as far as the Commission is concerned, whether that is a capital expenditure or an operating expense.

Trial Examiner: Well, is it not, from the testimony of the witness, largely an accounting proposition?

Mr. Culton: I think it is.

By Mr. Littman:

Q. Well, you haven't ascertained what the fact would [fol. 5360] be over the next ten years, have you, Mr. Hinton?

A. No, I haven't ascertained that. You would have to find out whether the life of the field would extend beyond the next ten-year required payments and it might be necessary to prorate that cost backward as well as forward.

Q. Mr. Hinton, is it a fact that the amounts shown in Line 26 of Page 3 of Schedule 3 for renewal bonuses in each year include one year of delayed rentals?

A. No, it is not.

Q. Now, does your answer apply as to both the Hugoton and Panhandle fields?

A. That applies to the Hugoton Field only.

Q. And what is the fact as to the Panhandle Field?

A. The same thing in the Panhandle Field will run from $5 to $15 per acre.

Trial Examiner: I don't quite understand that answer.

Mr. Littman: I don't understand that answer.

The Witness: As I understood the question, he asked me whether that renewal bonus, as shown on Page 3, of Schedule 3, applied to the Panhandle Field as well as the Hugoton Field. Am I right?

Mr. Littman: Yes.

The Witness: And my answer was, no, that it did not, because in the Panhandle Field that same renewal bonus would run from somewhere around $5 to $15 per acre, [fol. 5361] excluding the extreme marginal acreage.

In other words, it requires considerably more money to renew a lease in the Panhandle Field at this time than it does in the Hugoton Field.

By Mr. Littman:

Q. What I was driving at was this: Whether or not the renewal bonus in the Panhandle Field includes one year's delayed rentals?

A. No, it does not.

Q. And if does not include one year's delayed rentals in the Hugoton Field, either?

A. No, sir, it does not.

Q. Now, the reason for the increased cost of operating the compressor stations under both the basic and anticipated load is because of the increased cost of labor and the increased cost of fuel? Is that right?

A. That is true under the—yes, that would answer the question, because your pressure decline increases your fuel cost. I think that could be answered very simply.

Q. And your figures, your dollar figures throughout Schedules 3 and 4 include the cost of fuel required to operate the compressor stations? A. They do.

Q. Well, will you look at your work papers and give us an example in one or two or three years, to show approxi-
[fol. 5362] mately how much that runs?

A. Do you mean how much it runs for a year, the fuel?

Q. Yes.

A. The cost of fuel under the present load base for the Sneed station was $44,306 in 1940; $54,223 in 1941. It is estimated that it will be $67,457 in 1942; and $72,417 for 1943; $76,385 for 1944 and $82,337 for 1945, and $87,297 for 1946.

Q. Now, those amounts are included and reflected in the amounts shown in Schedule 3, Page 1, Line 14, is that correct? A. Yes, that is correct.

Q. Did you give the amount included in 1940? A. Yes.

Q. What was the amount? A. $44,306.

Q. And that amount was taken from the company's accounting records? A. That is correct.

Q. Now, would you be so kind as to read the same comparable figure for the Hansford station, which is shown on the same page?

A. The Hansford station did not operate in 1940.

Q. Yes, I note you don't start until 1941.

A. Do you want those for the years?

[fol. 5363] Q. Yes, for each of the years, the amount of fuel cost included in your figures shown in the Schedule.

A. For the year 1941 it was $31,560; for the years 1942 through 1946, the amount was $25,800.

Q. And is that included and reflected in the figures shown in Line 12 of Schedule 3, Page 1?

A. Yes, you will note that that is a decline over the 1941 cost.

Q. Will you state the fuel costs that are included for the Hugoton Field, basic load, on Schedule 3?

A. None.

(Discussion off the record.)

By Mr. Littman:

Q. Will you give us the comparable figure, that is, the fuel cost that is included for the Panhandle Field under the estimated future load as between Hansford and Sneed shown in Schedule 4, Page 1?

A. You mean "as between" or "for each"?

Q. I meant, for each.

A. The fuel figure for the Sneed compressor station for the year 1940 is $44,306; for 1941 it is $54,223; for 1942 it is $73,850; for 1943 it is $85,710; for 1944 it is $92,147, and for 1945 it is $108,469; for 1946 it is $115,074.

Q. And the figures which you just read are reflected [fol. 5364] in, and included in, the figures shown in Line 14 of Page 1 of Schedule 4 of Exhibit 43?

A. Yes, that is correct, they are so reflected.

Q. Now, will you proceed to give us the Hansford station figures which are shown in Line 12 of that page?

A. For the year 1941, $31,560; for 1942 it is $49,500; for 1943 it is $54,450; for the year 1944 it is $55,200; for the year 1945 it is $60,600; and for the year 1946 it is $60,600.

Q. Now, Hansford and Sneed compressor stations used natural gas exclusively for fuel, did they not? A. Yes.

Q. And all of the fuel figures that you have given us thus far are natural gas cost, exclusively.

A. That is correct.

Q. Now, will you please give us the comparable fuel cost figures reflected in Schedule 4, Page 3 of Exhibit 43?

A. Which schedule, please?

Q. Schedule 4, Page 3, for the Hugoton Field estimated future load.

A. I believe you will have but one figure for the year 1946.

Q. That is correct.

A. And that figure will be $9,632.

Q. Mr. Hinton, doesn't your estimate of increased pro- [fol. 5365] duction include the quantities of gas used by Panhandle Eastern as fuel in its own operations?

A. It does.

Q. Page 15 of Exhibit 42, I believe, states that very clearly, does it not?

A. It should if it doesn't.

Q. At that point you say, "this estimate was the same as that contained in Exhibit 40, which is in connection with his testimony, and we so adjusted the gas at 16.4 pound base with an addition for the gas required for power and loss due to line leakage. The estimated requirements are as follows:"

Then follows the amount of gas which includes the amount used in your own operations.

A. That is the way it should read.

Q. And that, of course, includes the amount of fuel used in the compressor stations?

A. That is correct.

Q. Inasmuch as the increased royalties, production, operation and maintenance, which you estimate and show in Schedules 3 and 4, include the cost of producing gas, the increase for fuel is a duplication, is it not?

A. No, sir.

Q. Why?

A. Not if I understood your question correctly. Would [fol. 5366] you state that question again, please?

Q. Since the increased royalties, production, operation and maintenance include all the costs of producing gas, the increase for fuel is a duplication, is it not?

A. No, sir, it is not.

Q. Well, who does Panhandle Eastern Company pay for this fuel?

That is, to whom do they pay these amounts that you have read into the record as the cost of fuel?

A. They deduct that. It has to be deducted from their potential amount of money that would be obtainable for that gas.

Mr. Culton: In other words, it is reflected in the sales on the other side of the ledger?

The Witness: That is right. If it were not for the fact that we had to have the fuel, the sales would be far beyond what they are.

They are influenced by the percent required for fuel.

By Mr. Littman:

Q. And to whom do they sell this gas that Mr. Culton suggested to you a minute ago?

A. They don't sell it.

Q. Well, Mr. Hinton, there certainly is a duplication in your exhibit.

Mr. Culton: We think you should examine the ac-
[fol. 5367] countant about that. I think you will find you are under a misapprehension, yourself.

By Mr. Littman:

Q. Well, do you know of your own knowledge whether you have actually duplicated the fuel cost in your Exhibit 43?

A. I would say that it has not been duplicated, but that only proper allowance has been made for it.

Q. But you are not sure about it?

A. As far as I am concerned, it has not been duplicated. It is a justifiable allowance.

Mr. Goodman: How do you derive it, Mr. Hinton? What figures do you pull out to get this fuel cost?

The Witness: The worth of the gas to Panhandle Eastern Pipe Line Company, that is established by the Accounting Department.

Mr. Goodman: Then, it is not a cost figure, it is a valuation?

The Witness: I expect that would be a better way of saying it.

Mr. Goodman: But all cost figures for the quantities of gas produced, both sold, lost and used, have been excluded?

The Witness: Yes.

Mr. Goodman: But on top of that you add a certain valuation figure, representing additional value over and above cost for the gas which was used as fuel?

[fol. 5368] The Witness: No, we include—

Mr. Goodman: (Interposing) You say "no", but there is no question but what you have done it, on the basis of your answers, Mr. Hinton. Wouldn't you like some time to think it over?

The Witness: No, I don't need time.

By Mr. Littman:

Q. Mr. Hinton, let's get at it this way:

You include,—and this will take just a minute, if your Honor please—in your tables, Schedules 3 and 4, every dollar of expense required to produce every M. c. f. which the company is going to use as fuel to operate its compressor stations. Is that right?

A. That is right.

Q. On top of that, you have added the amounts which you have just read into the record, which the Accounting Department says it has evaluated as the cost of the gas used as fuel for compressor stations, have you not?

A. Yes.

Q. So you have duplicated by that procedure every dollar which you include in your exhibit for the cost and expense of producing the gas which will be used as fuel in your own operations, inasmuch as you have already stated that your total amounts of gas produced include the [fol. 5369] amounts to be used as fuel. Is that not right?

A. Yes, and if it was not done that way, there would be a different value of that gas at the sales end of the line.

Q. Well, how is this value of gas determined?

A. It is determined by averaging the worth of the gas into the line, that is in the line owned by the company.

Q. But all of that is added on top of all those other expenses for each and every M.c.f. that you have included in your exhibit. Is that not right?

A. In answering that question, I would say that you would have to make allowances elsewhere if it was not carried on in the manner in which it is.

Mr. Goodman: Where would you make those allowances?

The Witness: You would make it in the price of gas. In other words, this gas down in the field would have very little value if we did not use gas to compress it and get it to the market.

Mr. Goodman: All right, but you have already indicated the costs of producing the total gas which you have produced?

The Witness: That is right.

Mr. Goodman: Now, you use up some of that gas?

The Witness: That is right.

Mr. Goodman: Your cost has not increased any, you haven't spent any more money, is that right?

The Witness: Why, we certainly have, Mr. Goodman, because if we could transport the same amount of gas to [fol. 5370] the sales end of our line as we put into Liberal without any deduction for fuel, we could afford to sell our gas at a lower price.

There must be some allowance made there. Whether I am talking about it in the strict, proper accounting method or not, I do not know. I am not an accountant, but I do feel that the method in which it has been handled is justifiable.

Mr. Goodman: You mean you are just out, then, that quantity of gas which you have produced?

The Witness: That is right. We pay for it and if we did not have an allowance to get that back, why, it would show that we had taken a decided loss in dollars.

Mr. Goodman: Well now, shouldn't you, then, deduct from the value of the gas consumed what you have already paid for it?

The Witness: I don't know, Mr. Goodman, I believe that is an accounting problem and would have to be decided by the Accounting Department.

As I see it, there are several ways in which it might be handled.

By Mr. Littman:

Q. Let me ask you this: If there is an offsetting figure entry in the books to offset the amount which you used and took from the books as the actual cost of gas used in fuel, then, would you admit that you have made a duplica- [fol. 5371] tion in Exhibit 43 for the cost of fuel?

. . . . . .

[fol. 5372] C. H. Hinton a witness, having been previously sworn, resumed the stand and testified further as follows:

Cross-Examination (Continued)

By Mr. Littman:

Q. Mr. Hinton, have you had an opportunity, over the noon recess, to reflect a little about these fuel costs which are included in your Schedules 3 and 4 of Exhibit 42?

A. Yes, sir, I have.

Q. And do you now say that you have duplicated in these schedules the cost of fuel used in compressor station operation?

A. I believe the answer that I first gave was correct, that whatever it is, the application of the amount of the fuel for the compressor station is reflected in the selling price of the gas.

Q. I am afraid I do not understand that answer.

A. That is, it is merely an accounting matter, and there is a credit shown which is reflected in the accounting records and the amount of the power cost is shown as a credit upon the company books.

[fol. 5273] Q. And should be credited against your Schedules 3 and 4 as well?

A. Yes, I would say that a proportionate part of it should.

Q. In other words, there is a duplicattion, you say now, to the extent of at least a proportionate part of it?

A. Yes.

Mr. Culton: By that you mean if you pay no attention to the receipt records on the account, there would be a duplication?

The Witness: Yes.

Mr. Culton: But by considering that circumstance, there is no duplication at all?

The Witness: The duplication will be erased as soon as the credit which will appear on the accounting records is applied to this proportionate part of it with the exception of the cost of purchased gas which is not shown in Exhibit 43.

By Mr. Littman:

Q. In other words, if I correctly understand you, the Federal Power Commission cannot use these figures shown in Schedules 3 and 4 of Exhibit 43 for purposes of com-

putting the effect of these figures upon the rates for the periods shown until and unless a credit is made against the totals for the cost of fuel used in operations?

[fol. 5374] A. I believe that that would be correct.

Q. Now, in order that we may have no misunderstanding about it, your operation and maintenance costs shown and totaled in Schedules 3 and 4 of Exhibit 43, include all of the operation and maintenance costs for every M. c. f. gas contemplated to be used and used, in fact, by Panhandle Eastern as fuel?

A. No, it does not include the purchased gas. By that I mean the gas which is purchased from other vendors than Panhandle Eastern.

Q. Would you say my question was correct if I were to confine it to the number of M. c. f.'s which are shown in Schedule 5 of Exhibit 43?

A. Yes, I believe that would be approximately correct.

Q. Well, it would be wholly correct, wouldn't it,

A. I say approximately, because those figures shown in Schedule 5 are estimated figures. If we assume that my estimate is 100 percent, then I will say that your conclusion is wholly correct.

Q. Well, your cost of operation figures shown in Schedules 3 and 4 are the estimated costs to produce the estimated amounts of M. c. f.'s shown in Schedule 5 of Exhibit 43, is that correct?

A. Yes, that is correct.

Q. Now, may we then not agree that in so far as the gas [fol. 5375] expected to be produced by Panhandle Eastern, in so far as that gas is concerned, that you have included in your Schedules 3 and 4 the cost of operation and maintenance for all of that gas which will be used as fuel, is that right?

A. Yes, speaking as of a point of location at the intake side of the compressor station, that would be correct.

Q. What compressor station?

A. Any compressor station that uses fuel.

In this case, it would be Sneed and Liberal, meaning Sneed for the Panhandle gas and Liberal for the Hugoton gas, up to the year 1946, on the estimated schedule where that portion of the gas that goes through the Hugoton system is again compressed, that is, I refer to the proposed station which will be located near Hugoton, Kansas.

At that time, we would have to apply that to the intake side of that proposed station.

Q. Well, we have all the costs of operation and maintenance included in Schedules 3 and 4 in order to produce the total number of M. c. f.'s which are shown in Schedule 5 of Exhibit 43 and which include the M. c. f's out of that total that will be used as fuel, is that correct?

A. I believe that is correct, but I had better check that back to be sure.

Will you repeat that question, please?

(Whereupon, the pending question was read by the reporter.)

[fol. 5376] The Witness: Yes, that is correct.

By Mr. Littman:

Q. Now, in addition to those maintenance and operation costs, you have included an additional and separate amount in each of the years for fuel and in the amounts which you read into the record late this morning?

A. That is correct.

Q. Over and above the costs to which I have just referred?

A. No. Are you referring to Schedules 3 and 4?

Q. Yes.

A. No, they are reflected in the schedule, those fuel costs are reflected in those schedules.

Q. I mean, over and above the operations and maintenance costs?

A. Yes. As I have said, that is with the exception of the gas purchased from others.

Q. Well, I am coming to that now.

Assuming that the Commission were to accept the totals for these schedules as the operation and maintenance costs west of Liberal, and assuming that the Commission were, in addition thereto, to include in determining the rates for the future the cost of gas purchased, is it not a fact that under those circumstances the entire amounts which you read this morning into the record of fuel costs which are [fol. 5377] included in Schedules 3 and 4 would have to be credited against the total which I just stated?

A. Yes, they would have to be credited by the amount of the gas purchase contracts. Also, there would have to be an allowance made for the depletion and amortization required in the system to produce the amounts of gas which would come from company wells.

Q. And the real credit would be the same rate per M. c. f. as that which you charged in these schedules for fuel?

A. The credit would have to be the same rate, yes, sir, and I believe that that is compulsory under the Federal Power Commission System of Accounting.

Q. Now, Mr. Hinton, on that particular subject, am I correct in understanding that the books of Panhandle Eastern show separately as an item of expense the cost of fuel used in the company's operations, is that right?

A. That is correct.

Q. Now, further on down the expense side of the books, there is a credit in an equal amount made, is that not correct? A. That is correct.

Q. In other words, it is put in to expense and then taken out?

A. Yes, and the reason that it is put in, it is an arbitrary figure selected for the purpose of comparing the cost of operations at the various compressor stations located along [fol. 5378] the system.

Q. In other words, if you did not make a credit and take it out later on, you would have a duplication in the expenses shown on your books to that extent, would you not? A. Yes, that is true.

Q. And, as you state, it is shown that way on the books of the company in order to merely show, as a separate item, how much it costs each year to supply fuel for operations, is that right?

A. That is as I understand it, yes, sir.

Q. Now, what you did, if I understand you correctly, was to take the fuel-cost figure for your base year, 1941, from the books of the company and include it in Schedules 3 and 4 of Exhibit 43, under the title of "Operation for the Compressor Stations?"

A. I applied the unit cost which was furnished by the Accounting Department to the M. c. f. that would be required for fuel.

Q. And you did not make any credit for deduction from that amount?

A. No, that is done in the Accounting Department.

Mr. Culton: Mr. Littman, you have been questioning quite a while about a matter on which we are fully agreed, that if expenditures are not related to receipts and are considered only from the standpoint of expenditures, then the [fol. 5379] item for cost of gas used for fuel would come out.

Mr. Littman: Would come out?

Mr. Culton: As an expense item. There is no question about that between us, but if you apply it to receipts, that is, to our book records showing we have received from our sales this sum of money for this gas, then it would have to be considered.

It would have to appear on both sides, both as a charge and as a credit.

By Mr. Littman:

Q. Now, I believe you have stated, Mr. Hintop, that the figures shown in Schedules 3 and 4 of Exhibit 43 do not include the cost of gas purchased by Panhandle Eastern from its vendors? A. That is correct.

Q. I would like to have you estimate for us the amount of the cost of gas purchased under the basic load in the Panhandle Field for the year 1941, using as the unit cost the figure of 4.47 cents.

A. For Hugoton Field, you say?

Q. I said, for Panhandle Field.

A. Well, then, that unit cost would be wrong for the Panhandle Field.

Q. What is the correct amount for the Panhandle Field?

A. 3.47 or 3.48.

[fol. 5380] Q. I thought I just mentioned that—

Mr. Culton: You said 4.47.

The Witness: For the Panhandle Field.

Mr. Littman: I mis-spoke myself. I thought I read 3.47. That is the figure I meant to say.

The Witness: I just called your attention to it because we will have to make a calculation—

By Mr. Littman:

Q. (Interposing) Using the average cost per M.c.f. of gas purchased in the Panhandle Field of 3.47 cents per M.c.f., I would like to have you give us the cost of purchasing the amounts of gas which you anticipate will be purchased under your assumption of the basic load.

Mr. Culton: Do you mean that for each of the five years or 15 years?

Mr. Littman: I asked him for the year 1941.

Mr. Culton: I did not catch that.

Mr. Littman: Yes, for the year 1941.

By Mr. Littman:

Q. Mr. Hinton, I am quite sure you will find the amount of gas purchased under the basic load in Exhibit 132, which is a copy of one of your working papers.

Mr. Culton: There is no difference that year between the basic and the anticipated, is there?

Mr. Littman: That is right.

[fol. 5381] The Witness: That is for the year 1941?

Mr. Littman: Yes, sir.

The Witness: That amount would be $707,061.08.

Mr. Littman: For our present purposes, let us not consider the pennies.

The Witness: All right.

By Mr. Littman:

Q. Now, when that amount is added to the total of Column "C" for the year 1941 for operation and maintenance costs west of Liberal shown in Schedule 3, Page 2, Line 10, you secure the total—

A. (Interposing) Wait a minute. You say, Schedule 3, Page 2?

Q. Yes.

A. For the Panhandle Field?

Q. For the Panhandle Field basic load.

A. My Exhibit 43, Schedule 3, Page 2, is a grand total.

Q. Yes, that is what I mean.

A. I see.

Q. I want you to add to the grand total of your maintenance and operation costs west of Liberal under the basic load in the Panhandle Field, the cost of gas purchased in that year in that field, to give us the total cost of gas purchased and operation and maintenance.

A. That amount is $1,165,515.

[fol. 5382] Q. Now, I would like to have you state the unit cost per M.c.f. produced and purchased—

Mr. Culton: (Interposing) On your computation?

Mr. Littman: (Continuing) Just a minute. In the Panhandle Field under the basic load for the year 1941, which is simply the total which you just gave, divided by the number of M.c.f.'s produced and purchased in that year.

Mr. Culton: Without making another computation, you want the gas used for power deducted before you make that computation, don't you?

Mr. Littman: Mr. Culton, I am going to suggest that we not make the credit for fuel.

Mr. Culton: All right. It would be a very small amount anyway.

Mr. Littman: It probably would, when reduced to unit cost, but we do not want to get to that fine a point for purposes of this line of inquiry.

Mr. Wheat: What was your figure of M.c.f.'s?

The Witness: 44 billion cubic feet.

By Mr. Littman:

Q. In other words, you are now referring to total M.c.f.'s shown in Exhibit No. 132 for the west Panhandle Field, aren't you?

A. Yes.

Q. Of 44 million M.c.f.?

[fol. 5383] A. I do not have Exhibit 132 right at hand, but it is shown on 131, and that is what I am using.

Q. Yes; it is the same figure, but pretty soon you may have to use Exhibit No. 132.

A. You want the basic load, and that is probably on Exhibit 132. What is it?

Q. 44 million. It is the same figure under both.

A. Yes, but if you want me to continue on the basic load, I will have to have—

Mr. Culton: (Interposing) The next one is 45 million for a good many years, I think.

The Witness: Yes, but the amount purchased—now, then, I have the answer to your question.

By Mr. Littman:

Q. Very well, what is it?

A. The cost of gas per M.c.f., including maintenance and operation, as shown throughout this schedule and in addition to that, the purchase cost but without allowance for depletion and amortization is .0265 cents per M.c.f.

Q. I think your decimal point is off. You mean, $.0265 or 2.65 cents, do you not?

A. Yes, I stand corrected.

Q. Suppose we be consistent throughout, and read these unit costs in terms of cents.

A. All right.

[fol. 5384] Q. 2.65 cents is correct?

A. Yes.

Q. Now, I would like to have you compute the unit cost of the items which you just named on the same basis for the year 1942 under the basic load.

A. Yes. The answer for 1942 shows a unit cost of 2.66 cents per M.c.f.

Q. That is the figure we have.

Now, I shall read the comparable unit costs which we calculate from your exhibit, Mr. Hinton, and we will ask you to check these figures and correct them if they are wrong, in order to save time on the record now.

A. Yes, sir.

Q. Now, for the Panhandle Field under the basic load, reflected in Schedule 3, Pages 1 and 2, the unit cost figures are as follows:

For 1941 — 2.65 cents.

For 1942 — 2.66 cents.

For 1943 — 2.64 cents.

For 1944 — 2.61 cents.

For 1945 — 2.63 cents.

For 1946 — 2.41 cents.

Now, Mr. Hinton, assuming the mathematical correctness of those figures which I have just read into the record, they show, do they not, that the unit cost of operation [fol. 5385] and maintenance and cost of gas purchased through the years 1941 through 1946 do not vary to any appreciable extent?

A. No. These do not vary to any appreciable extent, but if amortization and depletion were included on the additions which will be required to bring the gas purchased volumes down to what they are, they would show an increase.

Trial Examiner. May we have the comparable figure for 1940, without too much trouble, at this point?

Mr. Littman: I do not have the comparable figure for 1940.

Trial Examiner: Can you give us that, Mr. Hinton?

The Witness: Yes, I can.

Mr. Littman: Nor do I have it for the five-year period.

Mr. Wheat: You mean the total?

Trial Examiner: Average.

Mr. Littman: The average for the five-year period.

The Witness: During the year 1940, we purchased 16,427,962 M.c.f. and by applying the same unit price of 3.47 cents per M.c.f., we arrive at a cost of $570,050. The cost per M.c.f. to Panhandle Eastern was 2.37 cents per M.c.f.

By Mr. Littman:

Q. For the year 1940?

A. Yes.

Mr. Culton: Those figures will all vary greatly by the amount of purchased gas and by the amount of produced gas?

[fol. 5386] The Witness: That is correct.

Mr. Culton: And these prices are all higher than the prices if you had just used the produced gas?

The Witness: Yes, because without taking into consideration amortization and depletion, our purchased gas comes to us at a higher cash out-of-pocket cost.

By Mr. Littman:

Q. Yes, and we have been using, for purposes of our calculation, of course, the ratio of purchased and produced gas which you used in your estimate as shown in Exhibit 132 for the basic load and as you will soon see, as shown in Exhibit 131, for your future load.

A. That is correct.

Q. In other words, the unit cost, the over-all unit cost of producing your own gas goes down as you produce more?

A. That is right. Unless—

Q. (Interposing) And your total cost of gas purchased also goes down as you produce more from your own wells?

A. If you will confine that to the proper period of time, I will agree. If we carry that on beyond the period considered in these schedules, it will not apply.

Q. Well, you have shown, in your schedules, the data for the years through 1946, have you not?

A. Yes.

Q. Now, Mr. Hinton, you just alluded a moment ago to [fol. 5387] the fact that my unit cost figures do not include the cost of amortization and depletion, did you not?

A. That is right.

Q. Neither do yours?

A. That is correct.

Q. Now, the unit cost of depletion is the same, is it not, throughout? Are you familiar with Mr. Biddison's exhibit showing the unit cost?

A. No, I am not, and I might not agree with Mr. Biddison's depletion costs if I did see them.

* * * * * * * * *

Q. At any rate, for your information, Mr. Biddison shows a uniform unit cost of depletion for the gas produced in the Panhandle Field through the future years, and likewise in a uniform cost for the gas produced in the Hugoton Field.

Now, the figures which I have read to you show, do they not, that the unit cost of these items, of which we are talking now, to-wit, operations and maintenance and gas purchase expense will, under your assumptions under the basic load, be lower in 1946 than in 1941, is that correct?

A. No, if—

Q. (Interposing) Isn't 2.41 cents lower than 2.65 cents?

A. Yes, but we are only considering part of our prob-
[fol. 5388] lem when we refer to this as a comparison.

Q. And, Mr. Hinton, we are using that part of the problem which you have presented?

A. Yes.

Mr. Culton: You mention only part of it. He presented several million dollars capital expenditures that you paid no attendance to.

Mr. Littman: We are, at this writing, discussing the effect per unit of production of these so-called increased expenses.

Mr. Culton: That is, that part of the increased expenses.

By Mr. Littman:

Q. Well, may we agree, Mr. Hinton, that these increased totals which you show in Schedules 3 and 4 throughout for the various years do not necessarily reflect increased unit costs?

A. Yes, we may agree to that.

Q. And you do not mean to infer by these Schedules 3 and 4, do you, that simply because we have a larger total amount in 1946 over that in the previous years, that your unit costs are going to be higher in that year, do you?

A. Will you read that question, please?

(Whereupon, the pending question was read by the reporter.)

The Witness: Looking at it from a straight operating
[fol. 5389] and maintenance standpoint, reflecting the items shown in Schedule 3, they will undoubtedly show a decrease in cost per M.c.f., but when we take into consideration the amount of capital expenditure and the short-

end length of life of our reserve, why, naturally, they are going to show an increase.

By Mr. Littman:

Q. Well, you mean after 1946?

A. After 1946, the operating expenditures themselves will probably do much to hold the price level or slightly higher without consideration to the capital expenditures and the amortization and the depletion of reserves.

Trial Examiner: May I ask whether all of these figures that you read, Mr. Littman, are at the intake at the Liberal compressor station, the units costs?

Mr. Littman: They are at the points where this witness considered these costs shown in Schedules 3 and 4 to be, wherever that is, and I presume that is at Liberal compressor station and south, south of Liberal.

Trial Examiner: Well, at the intake at the compressor station?

The Witness: That is correct. That is the point of delivery covered by these figures.

By Mr. Littman:

Q. Now, what we are doing by these calculations, Mr. Hinton, is simply trying to ascertain what effect the fig- [fol. 5390] ures shown in your Schedules 3 and 4 plus the cost of purchased gas, will have upon the unit cost over-all of the gas produced, is that correct?

A. Yes. I think I understand entirely what you are doing, which is just to arrive at the unit cost per year.

Q. For the sums which you have shown in Schedules 3 and 4.

A. That is right.

Q. Plus the cost of gas purchased.

Now, you did not show anywhere in your Exhibit 43 the breakdown under the basic load in the Panhandle Field as between gas produced and gas purchased, did you?

A. I cannot be sure about that. You mean, whether it shows in my working papers?

Q. No, whether it shows in your original Exhibits 42 or 43?

A. I doubt seriously if it is in there. I do not recall putting it in.

Q. I am quite sure it is not.

Now, we have those figures in the record under the basic load in Exhibit No. 132, which were furnished from your working papers at my request, is that correct?

A. Yes.

Q. And we have the figures for the anticipated load as to both the west Panhandle Field and the Hugoton Field in [fol. 5391] Exhibit No. 131, which is a part of your working papers and which was also furnished at my request, is that right?

A. Yes, that is correct.

Q. Now, let's go to the next schedule, to-wit, Schedule 3, Page 3, which shows the maintenance and operation costs west of Liberal for the Hugoton Field under the basic load, and I shall read into the record the unit costs which we have calculated per M.c.f. for each of the years 1941 through 1946, including the cost of gas purchased in the amounts shown in Exhibit No. 132, at the price of 4.26 cents per M.c.f., which is the unit cost of gas purchased in the Hugoton Field as testified to by you in this morning's session.

I am going to read these, and I am going to ask you also to check the accuracy of my calculations.

A. That is Page 3, Schedule 3?

Q. Yes.

For 1941 — 4.32 cents.

A. Yes, it is thoroughly understood that these are subject to check.

Q. Yes. As a matter of fact, I am going to insist that you check them, because—

Mr. Culton: (Interposing) I will say these others look about like I have always understood them in the Panhandle Field.

Mr. Littman: Very well.

[fol. 5392] Mr. Culton: I am satisfied you have them about correct.

By Mr. Littman:

Q. The figures are as follows:

1941	—	4.32 cents
1942	—	4.42 cents
1943	—	4.72 cents
1944	—	4.48 cents
1945	—	4.44 cents
1946	—	4.44 cents

Now, assuming the correctness of the figures which I read, Mr. Hinton, they show an increase per unit from 1941 to 1943, and then a slight decrease for the remaining three years. Is that right?

A. They are constant for the last two years, which is a slight decrease over the previous years.

Q. Now, we have also made a total for both fields under the basic load, and we have calculated the unit cost per M.c.f. for the two fields under the basic load condition, and I shall read those into the record.

Trial Examiner: Pardon me, was not this last that you read based on Schedule 3, Page 3?

Mr. Littman: Schedule 3, Page 3, that is right, for the Hugoton Field.

Trial Examiner: That is captioned, "Basic Load, Hugoton Field?"

[fol. 5393] Mr. Littman: Yes. The figures that I propose to read into the record at this point are for both fields combined under the basic condition.

Trial Examiner: Still basic load?

Mr. Littman: Yes.

By Mr. Littman:

Q. The figures are as follows:

1941	—	3.09 cents
1942	—	3.12 cents
1943	—	3.18 cents
1944	—	3.10 cents
1945	—	3.10 cents
1946	—	2.94 cents

For the five-year average, 1942 to 1946, inclusive, 3.09 cents.

I shall now read into the record the unit costs comparable to those which I have read heretofore for the Panhandle Field under the estimated future load which is detailed on Pages 1 and 2 of Schedule 4. This is for the Panhandle Field alone.

1941	—	2.65 cents
1942	—	2.65 cents
1943	—	2.59 cents
1944	—	2.55 cents
1945	—	2.52 cents
1946	—	2.30 cents

[fol. 5394] The comparable figures for the Hugoton Field under the estimated future load are as follows:

1941	—	4.32 cents
1942	—	3.72 cents
1943	—	4.22 cents
1944	—	3.96 cents
1945	—	4.16 cents
1946	—	2.54 cents

Now, I shall read the unit costs for the Panhandle Field and Hugoton Field combined, and this is under the estimated future load:

1941	—	3.09 cents
1942	—	2.93 cents
1943	—	3.01 cents
1944	—	2.96 cents
1945	—	2.96 cents
1946	—	2.93 cents

For the five-year average, 1942 to 1946, both inclusive, 2.96 cents.

Mr. Culton: Mr. Littman, I must have misunderstood you or the averaging works out kind of funny. I understand you to say the estimated cost in the Panhandle Field, 1946, was 2.30.

Mr. Littman: Under which basis, Mr. Culton?

Mr. Culton: Under the estimated load and, in the Hugo-
[fol. 5395] ton Field, 2.54.

Mr. Wheat: I think you must have been mistaken in the last figure.

Mr. Culton: I do not see how that could be true and have an average of 2.93.

* * * * * * * *

The Witness: That unit cost which we used was 4.26, was it not?

Mr. Littman: Yes, 4.26 cents, and the amount of gas purchased in that year was 815,248 M.c.f. under the estimated future load—I am sorry, that is the total dollars.

The Witness: It is 12,897,000,000 cubic feet.

I do not get either one. I get 3.29.

By Mr. Littman:

Q. Let me ask you this, Mr. Hinton, what is the amount of dollars that you get for gas purchased in 1946 in the Hugoton Field under the estimate future load?

A. $549,412.

Q. Well, we have $815,248, so that would account for the difference in our figures.

A. I get the same answer that I got the first time, so instead of that being 3.54 as we suspected, it is 3.29.

[fol. 5396] Q. You get 3.29 cents per M.c.f.?

A. Instead of the—

Q. (Interposing) 2.54 per M.c.f. for the Hugoton Field under the estimated future load for the year 1946?

A. Yes.

Q. That is probably where the error lies.

A. Well, we can tell what percent each of these participates in the total market and check your figure in that manner.

By weighting those figures which we obtained by the same method of calculation which we have followed, namely, that of adding the cost of the purchased gas to the operating costs shown on these schedules, I arrive at a price of 2.65 cents per M.c.f.

Q. For what?

A. For both fields.

Q. What is that amount again?
A. 2.65 cents.

Mr. Culton: For both fields?

The Witness: Yes.

Trial Examiner: That is in place of Mr. Littman's figure of 2.93?

The Witness: Yes.

Trial Examiner: That, of course, would affect any average.

[fol. 5397] The Witness: Yes. In fact, to obtain an average, each year would have to be weighted with the amount that it participated in the total for the five years, to arrive at the proper average.

It would not be a pure arithmetical calculation.

By Mr. Littman:

Q. Well, you are going to check all of these figures, at any rate, Mr. Hinton, are you not?
A. Yes, I believe I had better.
Q. And if there are any errors in our calculations, you can then correct them tomorrow.
A. They look reasonably close to me and are taking the proper trend.
Q. And the trend is generally downward?
A. It must be, on this portion of the expense item.

. . . . . .

[fol. 5398] Q. Mr. Hinton, in arriving at the conclusion that Panhandle Eastern is going to abandon production in the Panhandle Field in the year 1956, you found it necessary to calculate the rock pressures and the open flows of the wells in the year of abandonment, did you not?

A. No, I found it necessary to estimate them, not calculate them.

[fol. 5399] In other words, I made a great many calculations that I did use as a guiding factor, but the answer is an estimate.

Q. Now, I would like to have you state the rock pressures of the Company's wells and gas purchase wells in Area "A" in the year of abandonment.

A. Now, then, your question, I believe, was that you wanted me to give you the abandonment pressure of the wells located in Group Area "A". Is that right?

Q. Yes, for the Company's wells and the gas purchase wells.

A. The abandonment pressure of the wells located in Group Area "A" will vary at the time of abandonment. I cannot give it to you in exact pounds, because it will vary probably with each well.

Q. Well, you mean you cannot supply the figures by individual wells?

A. No, I can't supply you with an estimated figure for each well. I do not have that. I assume that the average for all wells would be in the vicinity of 50 pounds.

Q. Mr. Hinton, the figures that I am endeavoring to elicit are those which appear in your working papers, File No. 11.

A. Yes, they are. There is a list of figures in File No. 11 that shows the average working pressures at the well head for various years and applies to the average of the [fol. 5400] total number of wells and does not apply to individual wells.

Q. Now, in your working papers, File No. 11, you have a sheet which shows Texas Company wells; Group "A", and shows the rock pressures and open flows for the wells in that group from the years 1942 through 1957. Is that correct?

A. It shows estimated rock pressures for the average of all wells in that group.

Q. Now, by "average of all wells," do you mean the average of the company-owned wells and the wells of vendors who sell to Panhandle Eastern?

A. No, because there are many of the wells from which gas is purchased from other vendors that now have rock pressures which are considerably below those shown in this working paper for the year 1948.

Q. Well now, what wells have you included in your working papers for Area "A"?

A. I have included 15 wells owned by the Panhandle Eastern Pipe Line Company, and 19 wells which are owned by the Huber Petroleum Company.

Q. And you have estimated the average rock pressure in the year of abandonment, have you not, for those wells?

A. Yes.

Q. What is the rock pressure in the year of abandonment for those wells?

A. The average rock pressure for all Company wells [fol. 5401] located in that area will be somewhere around 90 pounds, average.

Q. You are now speaking of the Company wells?

A. I am speaking of the Company wells located in Group Area "A".

Q. Isn't it closer to 93 pounds?

A. As shown on this working paper, it is 92.5, but it doesn't necessarily mean that they will be abandoned at 92.5.

The reason that I have picked that pressure for those wells is because the back pressure, open-flow curves indicate that the average potential on those wells at that date will be down to a point where it will be impossible to take gas in commercial quantities from them for a long-distance pipe line.

Q. And what is that average open flow in M.c.f. for 24 hours as of the year of abandonment?

A. As read from the back pressure, open-flow curves, it is 1,700,000 cubic feet.

Q. And the figure which you just gave of 1,700,000 cubic feet of open flow and of 92.5 pounds abandonment rock pressure is as of what year? A. 1956.

Q. Now, when you use the term "rock pressure", to what are you referring?

[fol. 5402] A. The shut-in well-head pressure.

Q. And not the pressure at the sand face? A. No.

Q. Very well.

Now, will you give us the comparable rock pressure and open flow estimates for the Company wells in Group Area "B" in the year of abandonment?

A. That is somewhat difficult to do, because Group Area "B", in my opinion, will have a closed-in well-head pressure which will be above the time or above the pressure required to make that a commercial-producing well.

Q. Well, suppose you read the figures from your working papers which are the ones you used in making this estimate, Mr. Hinton.

A. Just as soon as I finished what I was going to say.

It is not yet determined whether it will be profitable for us to keep our pipe line system operating for the small total amount of gas that was could obtain, therefore, the abandonment pressure will be dependent upon the time that we abandon the pipe-line system as a whole.

Q. Now, will you give me the figures that are shown in your working papers which represent your estimate?

A. I believe I have just explained that I do not know what they will be. I can give them to you for various years, as I have them on this working paper, or I can give [fol. 5403] them for any specific year which you ask.

Q. Are you speaking of Area "B"? A. Yes.

Q. Well, let's have the year of abandonment.

Mr. Culton: He has explained that he hasn't selected a year of abandonment in that area.

By Mr. Littman:

Q. Well, let me have those figures for the year 1956, which is the date on which you testified Panhandle Eastern is going to abandon them.

Mr. Culton: We ask that counsel read what the witness testified.

By Mr Littman:

Q. Is it your testimony that Panhandle Eastern is going to cease operations in the Panhandle Field in 1956?

Mr. Culton: Just read that and see what he said about 1956

"Whether it will be economical for this company to continue to produce gas after deliverability declines to 7 billion cubic feet in 1956 is problematical."

Then, he says: "Therefore, it is my judgment that Panhandle Eastern will not be justified in further producing gas from its reserves in the Panhandle Field longer than 15 years from the present."

I was reading from Page 40, Exhibit 42, showing that he [fol. 5404] was talking about the economics of the situation.

By Mr. Littman:

Q. And Mr. Biddison then comes along and accepts Mr. Hinton very literally and abandons the project on December 31, 1956, in the Panhandle Field.

Well, just give us the figures for 1956. We will argue these matters later in a brief, probably.

A. All right. The rock pressure, the closed-in well-head pressure for the year 1956 will be approximately 145.5 pounds, as shown in working papers from File No. 11.

Q. Your working papers?

A. Yes, my working papers.

Trial Examiner: Is that an average of a large number of wells?

The Witness: No, there are not so very many wells in that group area. There are five wells located in Group Area "B" at the present time, with two potential locations.

By Mr. Littman:

Q. And what is the open flow of those wells?

A. The average open flow for the wells in Group Area "B" in 1956 is estimated to be 3,160,000 cubic feet.

Trial Examiner: At the present time, as appears from your pressure map, there is no part of your Area "B" in which the indicated rock pressure is less than 350 pounds?

The Witness: That is the band between the 400 and [fol. 5405] 350 pound pressure isobar.

You will, also, note, Mr. Examiner, that there still remains a high-pressure area to the west of Group "B" in which there is very little development to date.

By Mr. Littman:

Q. Now, will you give us the comparable figures for Area "B" in the year 1959, which are shown in your working papers?

A. The pressure shown for 1959 is 96 pounds

Q. And what is the open flow for that year?

A. 1,590,000, assuming that the characteristic of the well does not change.

All open flows which I have down here are based on the assumption that the characteristic of these wells will not change.

Q. Now, will you give us the comparable figures for the wells in Group Area "C" as of 1956?

A. The pressure in 1956, closed-in pressure, will be approximately 98 pounds.

Q. And the open flow?

A. 2,240,000 cubic feet.

Q. Now, what are the figures for the year 1958?

A. 60 pounds closed-in well-head pressure.

Q. And the open flow for 1958?

A. 1,880,000.

[fol. 5406] Q. Cubic feet. A. Cubic feet.

Q. Now, will you state the estimate for Group Area "D"?

A. For Group Area "D", it is estimated that the closed-in well-head pressure will be 54.5 pounds.

Q. In the year 1956? A. Yes.

Q. And what about the open flow?

A. It was too small to take into consideration.

Q. You didn't calculate it? A. No.

Q. Will you state the 1956 estimate of rock pressure and open flow for the wells in Group Area "E"?

A. 88.5 pounds and the open flow will be 2,200,000 cubic feet.

Q. And what is the estimate in the last year shown in your working papers, to-wit, the year 1957?

A. 66 pounds closed-in well-head pressure, and the open flow is 1,525,000 cubic feet.

Q. Will you state your estimate, as shown in your working papers, for the wells in Group Area "F" for the year 1956?

A. Yes. I think it will be around 83.5 pounds and the open flow based on the average will be 5,238,000 cubic [fol. 5407] based on the present characteristic of the well.

Q. You have also estimated in your working papers the closed-in well-head pressure and open flow for the

wells in Group Area "F" down to as late as 1960, have you not?

A. No, sir, 1957 is the last year.

Q. For Group Area "F"? A. Yes, "F".

Q. Now, will you give us the figures for that year?

A. The closed-in well-head pressure for the year 1957 will be approximately 60 pounds.

Q. And the open flow in the year 1957?

A. It will be 3,285,000 based on present well characteristics.

Q. Now, will you give us your estimate for the year 1956 for the wells in Group Area "G"?

A. I think they will be approximately the same as "F", being a closed-in pressure of 86.5 pounds for 1956, with an open flow of 2,175,000 cubic feet per well.

Q. What estimate do you have for the year 1957, for the wells in Group Area "G"?

A. A closed in well-head pressure of 63 pounds with an open flow of 1,125,000 cubic feet.

Q. Mr. Hinton, you were going to supply certain information with respect to capital additions which you anticipated were going to be installed in the year 1944; [fol. 5408] which are itemized in your Exhibit 42 under the anticipated load.

A. Yes, also for the year 1942, because the amounts which were read into the record previous to this date were from memory and subject to correct.

I believe at that time we agreed that they could be corrected at a later date if they were found to be in error.

Q. Yes, would you mind proceeding with the year 1944, which is detailed beginning on Page 29 of Exhibit 42?

Now, I would first like to have your description of Item "J" on Page 30, "Construct Well Lines Connecting Five Oklahoma Wells and Five Kansas Wells, Costing $16,820."

A. The lines included under Item "J", Page 30, Exhibit 42, are described in more detail as follows:

The Gloden, commencing near the center of Section 36, Township 5, Range 13 and extending to a point near the center of Section 36, Township 5, Range 13, Texas County, Oklahoma, a 4-inch line 1 of one mile in length.

The Interstate Cattle Company, the line will start at a point near the center of the west half of Section 11, Township 4, Range 13, and extend to a point near the center of the south half, Section 11, Township 4, Range 13, Texas County, Oklahoma, a 4-inch I. D. line, .27 of one mile in length.

Another Interstate Cattle Company line will commence near the center of Section 14, Township 4, Range 13; and [fol. 5409] will extend to the northwest quarter of Section 14, Township 4, Range 13, Texas County, Oklahoma, a 4-inch I. D. line, .46 of one mile in length.

The Interstate Cattle Company line starting near the center of Section 16, Township 4, Range 13, and extending to a point in the southwest quarter of Section 16, Township 4, Range 13, Texas County, Oklahoma, a 4-inch I. D. line, .30 of one mile in length.

The Tudor, that line will start near the center of the east half of Section 6, Township 4, Range 15, and extend to a point near the center of Section 6, Township 4, Range 15, Texas County, Oklahoma, a 4-inch I. D. line, .28 of one mile in length.

The lines which will be constructed in the State of Kansas during the year 1944 are described as follows:

The Cottrell, commencing at a point near the center of Section 27, Township 30, Range 38, and extending to a point in the southwest quarter of Section 26, Township 30, Range 38, Grant County, Kansas, a 4-inch I. D. line, .60 of one mile in length.

The Morgan, starting near the center of the northeast quarter of Section 22, Township 33, Range 39, and extending to a point in the southwest-one quarter of Section 23, Township 33, Range 39, Stevens County, Kansas, a 4-inch I. D. line, .80 of one mile in length.

[fol. 5410] The Moser, starting near the center of the south half of Section 34, Township 33, Range 38 and extending to a point near the center of the south line of Section 28, Township 33, Range 38, Stevens County, Kansas, a 4-inch I. D. line, 1.23 miles in length.

The Reynolds, starting near the center of Section 20, Township 31, Range 36, and extending to a point on the west line or near the west line of Section 20, Township 31, Range 36, Stevens County, Kansas, a 4-inch I. D. line, .50 of one mile in length.

The Witt, starts near the center of the north half of Section 26, Township 30, Range 38, and extends to a point in the southwest quarter of Section 26, Township 30, Range 38, Grant County, Kansas, a 4-inch I. D. line, .65 of one mile in length.

Q. Does that complete the description of the well lines in Oklahoma and Kansas expected to be installed in the year 1944? A. Yes, it does.

Q. Now, will you please give us a detailed description of Item "L" appearing on Page 30 of Exhibit 42, "Construct additional gathering lines serving new wells in Hugoton Field, costing $207,951"?

A. Yes. The additional gathering lines required in Oklahoma to extend the general gathering system to enable [fol. 5411] the connection of wells drilled during that year will be as follows:

The Interstate Cattle gathering line will start near the center of Section 22, Township 4, Range 13, Texas County, Oklahoma, and extend to a point in the southwest quarter of Section 16, Township 4, Range 13, Texas County, Oklahoma. That will be a 6-inch I. D. line, 1.3 miles in length. Tracey S. W., that will start near the center of Section 36, Township 5, Range 13, Texas County, Oklahoma, and will extend to a point near the center of Section 22, Township 4, Range 13, Texas County, Oklahoma, a 10-inch I. D. line, 4.5 miles in length.

The Kansas gathering lines required, that is, to extend the gathering system in the Kansas portion of the Hugoton Field to enable the connection of wells drilled during 1944 or proposed to be drilled, will be as follows:

The Cottrell, it starts in the northeast one-quarter of Section 4, Township 31, Range 38, Grant County, Kansas, and extends to a point in the southwest quarter of Section 26, Township 30, Range 38, Grant County, Kansas. It is an 8-inch, I. D. line, approximately 1.5 miles in length.

Of course, all of the distances given are approximate, because, without scouting the ground, it is impossible to make the exact proper allowance for surface measurement.

The Reynolds will start near the northeast corner of [fol. 5412] Section 6, Township 31, Range 36, Stevens County, Kansas, and extend to a point near the one-half west line of Section 20, Township 31, Range 36, Stevens County, Kansas, an 8-inch I. D. line, 3.3 miles in length.

The Witt starts at a point located in the northeast [quester] of Section 5, Township 31, Range 37, Stevens County, Kansas, and extends to a point in the northeast quarter of Section 4, Township 31, Range 38, Stevens County, Kansas. It is a 12-inch, I. D. line, which will be approximately 4.7 miles in length.

The Rickart Block is a loop line which loops part of the present gathering system, and that will start at a point in the southwest quarter of Section 5, Township 34, Range 38, Stevens County, Kansas, and extend to a point in the northeast quarter of Section 23, Township 34, Range 39, Stevens County, Kansas. It will be a 6-inch, I. D. line, 3.6 miles in length.

The Buddenburg, that is, also, a loop to the present pipe-line system, and will commence at a point near the northeast corner of Section 22, Township 33, Range 38, Stevens County, Kansas, and extend to a point near the center of the north half of Section 19, Township 33, Range 38, Stevens County, Kansas, a 10-inch, I. D. line, 3.3 miles in length.

The Morgan—that is a new line, and the first three mentioned at also new lines—will start at a point in the [fol. 5413] northeast quarter of Section 19, Township 33, Range 38, Stevens County, Kansas, and extend to a point in the southwest quarter of Section 23, Township 33, Range 39, Stevens County, Kansas. It is an 8-inch, I. D. line which will be 2.4 miles in length, approximately.

Q. Mr. Hinton, you show for the anticipated load that you expect to drill 72 wells in the Hugoton Field between the middle of 1941 to the end of 1946. Is that correct?

A. I don't remember the total, but if it is written in the testimony there, that is correct.

Q. That is the result of my addition of the number of wells shown for each period in the Hugoton Field.

Now, can you state how many of those wells are required to be drilled by reason of leasehold requirements?

A. Yes.
Q. All right.
A. None.
Q. Why are these wells required to be drilled?
A. Not as a present leasehold requirement, but as a requirement that has been put upon us by the fact that our leases have been top-leased by other companies.

Mr. Lee: Pardon me. What do you mean by "top-leased"?

The Witness: I mean that other companies have taken leases on acreage which we now hold by delayed rentals, which will become effective upon the date our lease ex-
[fol. 5414] pires and the only way that it is possible for us to hold that acreage as a part of our reserve is to drill before the expiration date of our lease.

Mr. Lee: Then, what happens to their top lease if you drill?

The Witness: They have spent some money for which they will receive no benefit, the company that has done the top-leasing.

By Mr. Littman:
Q. Now, is it this so-called top-lease condition that will cause you to drill these 72 wells?
A. No, not altogether, because there are only 14 of those wells included in the 72.
Q. 14 of which kind included?
A. Of the 72 that you mentioned to be drilled in the Hugoton Field.
Q. Well, you mean 14 of the 72?
A. Have been top-leased to date.
Q. Have been top-leased to date? A. Yes.
Q. What about the rest of them?
A. From time to time, of course, it is going to be necessary to drill wells to augment our supply and to furnish anticipated requirements.

We have in all cases, where possible, tried to pick leases [fol. 5415] which would expire, because by drilling before expiration date, we would not be forced to pay a renewal bonus which is prevalent, become more prevalent, in the Hugoton Field at this time.

Q. Now, in 1942, you expect to drill 20 wells in the Hugoton Field, do you not? A. Yes.

Q. Now, will you give us a breakdown of leases as between those which are required to be drilled to top-leasing, and how many are required to be drilled by reason of the fact that you do not wish to pay a renewal bonus, and any other classes that may exist?

A. The list that shows the leases which have been top-leased is now over at the hotel. I laid it out while trying to get my files in better order over the weekend, because I did not anticipate needing it and—just a moment, I believe I can give you that.

Of the 20 wells which are proposed to be drilled during the year 1942, the following 14 have been top-leased at this time—

Q. (Interposing) You don't have to name them. I just wanted you to tell me how many of the 20 wells which you propose to drill within the next year, are wells which are required to be drilled by reason of the top-leasing condition. A. 14.

[fol. 5416] Q. And what about the remaining six?

A. Well, it so happens that to supply our peak day requirement, we would have to take more gas than would be possible for us to get from our present system, even after the capital expenditures have been made that are set out in Exhibit 42 for the future estimated load.

In order to get the amount of gas required to supplement what we could get with the capital additions outlined for the Panhandle Field—I should confine that to the Panhandle Field—

Q. (Interposing) I am asking you about the Hugoton Field.

Mr. Wheat: He hasn't quite finished.

The Witness: Yes, but a while ago, I said, after the capital expenditures shown in Exhibit 42 had been made.

and part of this Oklahoma pipe line system in the Hugoton Field is included in that capital expenditure.

Do you see what I am getting at?

By Mr. Littman:

Q. I think I understand what you mean.

A. Of course, we can't tell exactly what size wells we are going to get there, but in order to give us the amount of gas that we want at Liberal station, it will be necessary that we are able to take from each well approximately 1,500,000 cubic feet per day.

[fol. 5417] Q. Now, Mr. Hinton, do I understand, then, that you are drilling 14 out of the next 20 wells in 1942 primarily because you are confronted with a top-leasing situation and, in addition thereto, you are drilling another six wells because you need additional gas over and beyond that which you will secure from the first 14 that I mentioned?

A. Yes, this is right.

Q. Now, there are 12 wells that are contemplated to be drilled in 1943 in the Hugoton Field. Will you give us the breakdown for those?

A. You are speaking now about the future load?

Q. Yes.

A. Ten of those wells are for main-line supply, and are located in the Hugoton Field or the portion of the Hugoton Field located in the State of Oklahoma.

These wells will be drilled in order to help supply the peak-day requirement and, inasmuch as the gathering system laid out in 1942 was designed so that we could take more gas as required at a future date, that is the logical place for us to augment our peak-day requirement at the least cost.

The other two wells mentioned are to help supply the Argus Natural Gas Company market, and they will be drilled in the Kansas portion of the Hugoton Field.

There are none of these wells top-leased to date.

Q. In other words, all of these twelve wells in 1943 [fol. 5418] are required to be drilled in the Hugoton Field, in your opinion, in order to meet the anticipated load requirements?

A. That is correct, and the locations were chosen from the standpoint of the greatest deliverability, rather than from the standpoint of the expiring leases in this year.

Q. What about the eleven wells that you propose to drill in the Hugoton Field in 1944?

A. Five of those wells will be located in Oklahoma, none top-leased, and five will be drilled in the Kansas portion of the Hugoton Field, and one will be drilled to help supply the demand of the Argus Natural Gas Company.

Q. So that none of these are to be drilled in 1944 by reason of a top-leasing situation?

A. That is correct.

Q. But because you feel it is necessary to drill those wells in order to meet the anticipated load requirements?

A. That is right.

Now, of course, the Texas wells are a different proposition all the way through.

Q. Yes. Well, all of the 15 wells contemplated to be drilled in the Panhandle Field are going to be drilled because of the top-leasing situation that you have described?

A. No.

Q. Or because of lease requirements?

A. Because of expiring leases and the renewal bonus [fol. 5419] being what it is in the Panhandle Field today, it is cheaper for the company to drill those wells than to take a chance of losing the leases or to be confronted with a stiff renewal bonus.

That applies to 13 of the wells and, as I have mentioned before, the two wells which are to be located on the State land are not included in this classification.

Mr. Culton: It gives you a longer amortization on the expense of drilling those particular wells, does it not, rather than to have waited to the last field to drill?

The Witness: Not only that, it helps to reduce our operating expense somewhat.

. . . . . .

[fol. 5420] By Mr. Littman:

Q. Suppose you give us the details of Item "E" for the year 1944, on Page 29 of Exhibit 42, before we go to the capital additions for the year 1942.

A. The well lines which will be required to connect wells proposed to be drilled in 1944 I described as folows:

The Hendrix starts near the center of the north half of Section 4, Block PMc, E. L. and R. R. R. R. Survey, and extends to a point near the center of Section 10, the same block and the same survey, Moore County, Texas. It is a 4-inch, I. D. line, 2.10 miles in length.

The Kilgore starts near the center of Section 8, Block [fol. 5421] PMc, Survey E. L. and R. R. R. R. and extends to a point near the center of Section 10, the same block and survey, Moore County, Texas. It is a 4-inch line, 1.10 miles in length.

Another Kilgore line will start near the center of Section 10, PMc, Survey E. L. and R. R. R. R., and extends to a point near the center of Section 10, the same block and survey, Moore County, Texas. It is a 4-inch line and will be .05 of one mile in length.

The State C. R., that line will start at a point in Section 101 of Block 47, H. and T. C. Survey, and extend to a point near the center of Section 100, Block 47, H. and T. C. Survey, Potter County, Texas. It will be .50 of one mile in length.

Another State well, C. R.—that is Canadian River—that starts at Section 105, Block 46, H. and T. C., and extends to a point in the north part of Section 106, Survey 47, H. and T. C. Survey, Potter County, Texas. It is a 4-inch, I. D. line, .90 of one mile in length.

Q. Now, going to the capital additions for the year 1942, under the anticipated load, I refer to Item "E" on Page 27, "Lay well lines for five new wells in Panhandle Field, costing $13,395."

Will you give the description of those lines?

A. The five lines which will be required to connect [fol. 5422] lines which the Company proposes to drill during the year 1944 are described as follows:

The Brown will start at a point near the center of Section 104, Block 44, H. and T. C. Survey, and extend to a point near the center of Section 64, Block 44, H. and T. C. Moore County, Texas. It is a 4-inch line, which will be approximately 1.50 miles in length.

The Jestur will start near the center of Section 18, Block 6-T, T. and N. O. Survey, and will extend to a point near the center of Section 64, Block 44, H. and T. C. Survey, Moore County, Texas, a 4-inch I. D. line, approximately 1.50 miles in length.

The Kilgore will start at a point near the center of the southeast quarter of Section 28, Block 44, H. and T. C. Survey, and will extend to a point near the center of the south half of Section 28, Block 44, H. and T. C. Survey, Moore County, Texas, a 4-inch, I. D. line, .30 of one mile in length.

The Kilgore, again, will start near the center of Section 29, Block 44, H. and T. C. Survey, and extend to a point near the center of the south line of Section 57, Block 44, H. and T. C. Survey, Moore County, Texas. It will be a 4-inch I. D. line that will be .20 of one mile in length.

The Walker-Allen, this line will start near the center of Section 6, Survey M-1, and will extend to the north half [fol. 5423] of the northeast of Section 5, M-1, Moore County, Texas. It will be a 4-inch line, 1.25 miles in length.

Q. Mr. Hinton, you gave us a description the other day of Item "G", shown on Page 27 in Exhibit 42, did you not? A. Yes, I did.

Q. Was there anything you wanted to add to that description?

A. I couldn't say, until I check back and found out what I had already given.

Q. In Item "G" on Page 28 for the year 1942, you have the construction of 20 new well lines costing $47,610. Would you please state the total length of those well lines and the sizes of pipe, without going into the details of the individual wells in this instance?

A. Yes. All wells, well lines shown to be constructed to connect those 20 wells will be 4-inch, I. D., and the

total length of the connecting lines of the 20 wells is estimated to be 14.69 miles.

Q. Will you please state the sizes of pipe for Item "G", the trunk gathering line looping the present line from Hansford station south a distance of 31.1 miles?

A. Yes, that will be 22-inch, O. D. pipe.

Q. Now, will you state the size of pipe and the length of the pipe for Item "G" on Page 27 for the year 1942 which relates to the looping of existing lines and addi [fol. 5424] tional gathering lines?

A. I was under the impression that that was the one which you just asked me about, the 31.1 miles.

Q. Well, I asked you about Item "G" a moment ago. Now, I am asking you about Item "H".

A. I understood you to say "G".

The loop line from Sneed, the intake side of Sneed compressor station to Windmill Junction will be 26-inch, O. D. pipe.

Q. And what is the distance? A. 2.7 miles.

From Windmill Junction to Zofness Junction, also a loop line, will be a 24-inch, O. D. pipe, a distance of 8 miles.

From Zofness Junction west along our present system will be a loop line that will be 20-inch, O. D. pipe, 6.33 miles in length.

The further extension of this line, looping our present system to the west, will be a 16-inch, O. D. pipe, 3 miles in length. There will be a gathering line which will start near the center of the south line of Section 57, Block 44, H. and T. C. Survey, and extend to a point near the center of Section 29, Block 44, H. and T. C. Survey, both in Moore County, which will be an 8-inch, O. D. line, which will be 1.2 miles in length.

[fol. 5428] C. H. Hixton a witness, having been previously duly sworn, resumed the stand and testified further as follows:

Mr. Littman: If your Honor please, I would like to have marked for identification with the next exhibit num-

ber, a table entitled, "Estimated Intake Pressures at Sneed Compressor Station."

I might state that this table contains certain data and information requested by me to be furnished by this witness during the course of his cross-examination.

Trial Examiner: This table will be marked for identification as Exhibit No. 139.

(Exhibit No. 139 Was Marked For Identification.)

Mr. Littman: I would like to have marked for identification with the next exhibit number a table entitled, "Estimated Average Working Pressures at Well Head (Gauge), for 'Group Areas', shown on Exhibit 46, Panhandle Field, Texas", which table was furnished by this witness at my request, which request was made during the course of cross-examination.

Trial Examiner: This will be marked for identification as Exhibit No. 140.

[fol. 5429] (Exhibit No. 140 Was Marked For Identification.)

Mr. Littman: I would like to have marked for identification as Exhibit No. 141, a table entitled, "Annual & Cumulative Production from Panhandle Field, Texas", which has been furnished by this witness pursuant to a request made by me during the course of cross-examination of this witness.

Mr. Wheat: This consists of two pages, does it not?

Mr. Littman: Yes.

Trial Examiner: The exhibit will be marked for identification as Exhibit No. 141.

(Exhibit No. 141 Was Marked For Identification.)

Cross-Examination (Continued)

By Mr. Littman:

Q. Mr. Hinton, I would like to have you refer to Exhibit No. 140 for identification.

Now, this exhibit shows your estimate of the average working pressures at the well head for the Company wells

and gas purchase wells for the years 1942 to 1960, inclusive, is that right?

A. That is correct.

Q. And this is under the anticipated load basis?

A. Yes.

Q. Now, it is possible for the company to so operate its production system as to raise or lower these estimated working pressures, is that correct?

[fol. 5430] A. By the addition of equipment, that is is correct. Without the addition of equipment, we are limited to certain limitations.

Q. In other words, these working pressures are predicated upon certain estimates which you made of capital additions and equipment required to mainttain these pressures?

A. Through the year 1946, that is correct.

Q. How did you arrive at them after the year 1946?

A. I carried the same idea down, generally speaking, but assumed that in the event that certain wells were unable to produce their proportionate share of the total production, that additional horsepower would be installed or the situation would be taken care of by revamping the pipe line system which would directly affect the type of well mentioned.

Q. Well, do I understand you to say that you expect additional facilities to be installed after 1946 in order to maintain the working pressures shown in Exhibit No. 140?

A. I expect additional equipment to be installed to enable certain wells to meet these working pressures as set out in Exhibit 140.

Q. Do you have the amounts of additional capital expenditures for those years?

A. No, I do not, because it would be impossible to lay your finger directly on where this additional horsepower will be required.

[fol. 5431] The only way that that could be worked would be to assume that every well in the field in each group area would have the same pressure drop year after year, and that will not happen.

Q. Then you did not make any estimate, in dollars, of the amount of capital additions that will be installed in order to secure these average working pressures shown in Exhibit No. 140, after 1946?

A. I did not make any dollar estimate, but I know that it is going to require considerable additional money.

Q. Well, can you give us some general idea, in dollars, of how much money it is going to require?

A. No, sir, that is another one of those "crystal ball" estimates.

Q. That you made?

A. Yes.

Mr. Culton: You made no attempt to determine capital expenditures after five years?

The Witness: No, because when you go beyond the five-year period, then you are going to encounter ever-changing characteristics of these wells.

The pressure drop on the wells is not going to be the same for each well in the field at all and, therefore, it would be impossible to go years into the future past 1946 and be able to make any accurate estimate of capital ex- [fol. 5432] penditures that will be required.

By Mr. Littman:

Q. How about a general estimate, in dollars, of how much will be required by way of capital additions for each of the years subsequent to 1946?

A. Well, that is a pretty tough question because, in order to answer that, I would have to figure out the cost of tubing for most of the wells. I would have to figure out the cost of installing many individual well-compressors and we do not know yet how much it is going to cost us to maintain wells as the pressure goes down.

We do know that we are going to have a great deal more water trouble as this pressure declines. That is evidenced by what is happening in the low-pressure wells in the field at this time.

What years that is actually going to happen, I cannot say. If I was going to lay aside money to make the necessary capital expenditures which I believe necessary, just offhand thinking about well after well, it would not be less than a quarter of a million dollars.

Q. Per year?

A. No.

Q. Do you mean after 1946?

A. Yes.

Q. In addition to the five years of capital expendi-
[fol. 5433] tures for the anticipated load which you have set forth in Exhibit 42?

A. Yes, and the sum that I mentioned does not take care of the change of the cylinders on the compressors at the Sneed compressor station.

I feel sure that that change will have to be made sometime after the year 1946.

Q. Well, how much more than a quarter-million dollars of capital additions would be required after 1946 to maintain these working pressures shown on Exhibit No. 140?

A. I cannot say. I do not know the cost of the changing of the cylinders.

Q. And you cannot give us any idea of the cost, above a quarter of a million dollars?

A. No, but that is just a very, very rough estimate, subject to a more detailed study.

Q. Now, I am correct in stating that these average working pressures which you assumed for purposes of your study and which are shown in Exhibit No. 140, could be lowered by the installation of additional capital facilities, is that right?

A. Yes, if we wanted to spend the money, why, we could probably work against as low as 70 pounds.

Q. (Interposing) In what year, Mr. Hinton?

A. Any year.

[fol. 5434] Q. Any year?

A. Yes. If we wanted to spend the money, but it certainly would be just like throwing it out the door to develop in that manner.

Q. Well, I was not talking particularly about a figure of 70 pounds. I was speaking about lowering these pressures beyond the figures shown in Exhibit 140.

It could be done by the expenditure of additional money for capital additions, is that right?

A. Yes, that is right; but going back, we anticipate or estimate that we have so much gas in our reserves in that

field, and it is not the intention of Panhandle Eastern to try to obtain a greater amount of gas than is actually contained or was originally contained in the reserves.

If we would go to pressure like that, it would mean that we would be taking amounts of gas per year that would be far in excess of what we should be taking for the reserve which we hold in that field.

Q. Well, Mr. Hinton, it is an engineering fact, is it not, that the reduction of these pressures through the years shown in Exhibit No. 140 would have the effect of increasing Panhandle Eastern's production through those years. Is that correct?

A. You say the reduction of these pressures?

Q. Yes.

[fol. 5435] A. Shown on Exhibit No. 140—

Trial Examiner: Read the question, please.

(Whereupon, the pending question was read by the reporter.)

The Witness: Yes, anytime that a well is enabled to work against a lower working pressure, it will have the ability to deliver a greater quantity of gas.

By Mr. Littman:

Q. And the quantities of gas which you, in fact, have estimated to be recovered under your anticipated load are predicated upon the average working pressures shown in Exhibit No. 140. Is that correct?

A. Yes, which is all tied back into the geological data.

Q. Didn't you testify earlier on your cross-examination that one of the major reasons why you were not interested in securing more gas from the Panhandles Field was because you did not have the market?

A. That is right.

Q. And not because you could not get additional gas out of the Panhandle Field if you wanted to?

A. No, but you cannot take any one of those things and set it out by itself. It has to be a coordinated plan of development and operation throughout.

Any time you take any one part of this problem and set it [fol. 5436] out to itself without coordinating with the other things involved, you lose track of the answer.

Q. Well, Mr. Hinton, I take it from the answers that you have given this morning that you are unable to give us the unit cost of producing gas in the Panhandle Field by Panhandle Eastern after 1946?

A. Without making further study that is right, and that could not be carried on far beyond 1946 at this time accurately, but an estimate could be made that would follow the path rather closely which we will be forced to follow.

Q. And the same answer, of course, would apply for any unit cost which would reflect the unit cost at the well head?

A. Yes, that is right. They are all estimated costs.

Trial Examiner: Mr. Hinton, I think perhaps Mr. Littman may have some questions that will bring this out, but let me ask at this point whether you have studied the production of natural gas in other older fields in the United States.

The Witness: Yes, I have, in two of the older fields.

Trial Examiner: What are those?

The Witness: One being the East Kansas-West Missouri Field, more commonly referred to around Kansas City as the Mo-Kan area and the Louisiana Field, I have given some study.

I was formerly in the Louisiana Field, several years ago and, of course, I have somewhat of an interest in it and I [fol. 5437] have watched it somewhat.

Trial Examiner: That is specifically the Monroe territory?

The Witness: Yes.

Trial Examiner: Is the Missouri-Kansas area still producing?

The Witness: Yes, it is.

Trial Examiner: That is part of your Local Area?

The Witness: That is correct. At this time, we have approximately 550 wells connected to our pipe-line system from that area.

Trial Examiner: Have you abandoned any wells in that area?

The Witness: Well, I would say that we have probably abandoned a thousand wells in the last ten years.

Trial Examiner: In what area?

The Witness: In the Mo-Kan area. That is scattered pretty well all over. The major part of the gas in Missouri comes from Cass County and Jackson County.

We only have one well in—I cannot remember whether it is the Ray Well in White County or the White Well in Ray County—and the Kansas production comes from Anderson, Linn, Franklin, Miami, and I believe we have just a little bit in the corner of Wyandotte County.

Trial Examiner: What is your initial pressure in this [fol. 543] Local Area field?

The Witness: The initial pressure in the Local Area field varies. The top production in that field, the pay section, is commonly called the Squirrel Sand. I think that is more or less a local name.

The deeper gas comes from what is termed the Bartlesville Sand, but there is considerable doubt whether it is the true Bartlesville Sand or not. It seems to be a scattered type of production and the pressure is, I would say, or the range of pressures encountered in the drilling-in of these wells, has varied from 30 pounds and, as I can remember, the highest pressure that I have observed was in the Rantoul district of 260 pounds.

As the wells are drilled, if two or three pays are encountered, there will oftentimes be a variation of several pounds between the top pay that is encountered and the bottom pay.

Trial Examiner: And what has been the usual abandonment pressure?

The Witness: That again varies. We have wells in the Blue Springs area that now produce against a pressure as low as 5 pounds.

The total monthly production from those wells hardly ever gets up to 100 M. c. f. for the month. Some of them are down as low as one M. c. f.

[fol. 5439] Trial Examiner: Is the problem of delivering from a gathering system into the transmission system, having in mind the pressures back of the intake, affected by the structural factors of the field or the geographical location of the field?

In other words, is the problem different in one field [what] what it is in another as to the deliverability of the gas from gathering systems into a transmission system?

The Witness: Yes, I would say that it is quite different in this respect.

As an example, the Town of Blue Springs is furnished by wells during the summer months which do not have to produce against a pipe-line pressure greater than five pounds.

Of course, a great deal of gas is used around Kansas City for house heating and in Blue Springs and in the winter time, as the demand becomes larger, then the pipe-line pressure has to go up in order to be able to furnish that town its supply and the wells are turned off for the winter months.

Of course, if wells of that nature were forced to feed or if the market terminus required high pressure, why, then they would no longer be used at all.

Trial Examiner: Well, the factors that you have mentioned relate rather to the market and the requirements of the market rather than to limitations in the characteristics of the source, do they not, the source of the gas, I mean?

[fol. 5440] The Witness: I am not sure that I followed that correctly, but I believe that it is the terms of the relationship of the source to the pipe-line system, am I right?

Trial Examiner: Yes, the thought I had in mind was to inquire whether, if you desired to deliver gas into a transmission system at any given pressure, the source of the gas behind the intake serving that transmission system would be affected by the nature of the field from which the gas originates, or by geographical location; and if so, in what manner?

The Witness: By the ability of the gas to flow through the porous media. In other words, if the gas had to be

taken and furnished to a transmission system at a high pressure in order to make that pay, of course, [horsepower] would have to be installed and the rate of flow from that well would be, in all probability, so great that in tight areas, it would not have the ability to migrate through the formation into the well bore in sufficient quantities to maintain a usable intake pressure for the well compressor units where it would be a first stage boost from the compressor up to the main transmission line.

Trial Examiner: So that when you are discussing the closed well pressure, that can have no great significance unless you know the character of the formation?

The Witness: That is absolutely correct.

[fol. 5441] Trial Examiner: And relate it to the quantity withdrawn?

The Witness: Yes, sir, because the closed-in well pressure is a pressure that is observed after the gas has had a considerable length of time to migrate into the well bore and as the rate of pull from that well exceeds the ability of the gas to flow into the well bore which is governed almost entirely by its permeability times the thickness of the pay, why, then the well falls off in its deliberability because, instead of working at an observed well-head pressure, it is going to work against a stabilized flow pressure which can only be determined when the pressure gets to the point where we can tell how fast it is going to flow through the formation.

The ability of gas to flow through formation is governed by, I believe, the same as pipe-line formulas. That is, the fundamental part of it being the difference in the square of the pressures and the difference in the square of 400 pounds and 300 pounds is a great deal more than the square between 200 pounds and 100 pounds, and I think that we are going to find that the ratio of flow through these formations in the Panhandle Field and in the Hugoton Field are going to be in about the same proportion as the difference, in squares, at these two pressures named.

Trial Examiner: And when you are serving a high pressure transmission line, you are working under sharp [fol. 5442] limitations of the withdrawal factor?

The Witness: That is correct.

Trial Examiner: As compared with a condition where you are serving a low-pressure transmission system?

The Witness: Where the rate of flow is comparatively low. Does that answer your question, sir?

Trial Examiner: Well, it indicates clearly that the withdrawal pressure is a factor that, in your judgment, is related strictly to the conditions, both geological and as to transmission requirements and market requirements, and would not necessarily be the same, nor the factors governing it, the same in fields in which there has been longer experience.

The Witness: I would say the fields where we have had longer experience would be no criteria for these two fields, because the Missouri-Kansas field is a sand producing formation, whereas the greater portion of our gas comes from Lime-stone, Dolomite and Granite Wash and in the Panhandle Field, and Limestone, largely, in the Hugoton Field.

Trial Examiner: And from the conservation standpoint, it would necessarily follow that the rapid removal of the reserves of the Panhandle Field, at least, would be wasteful?

The Witness: Yes, I feel that if the rate of withdrawal in fields of this nature is large enough that it pulls a low-pressure area within the field, the same as can be observed [fol. 5443] on the rock pressure map, Exhibit 26, to the Northeast side of the field there, I think that as the moisture is dropped out of this gas at these lower pressures, that portions of the permeability are clogged.

I have in mind that that is somewhat of a capillary attraction through the formation, and from a conservation standpoint, I believe that the greatest amount of gas could be obtained from a field of this nature if it were possible to operate that field so that there could be no low-pressure areas pulled within the field at any place.

By Mr. Littman:

Q. Mr. Hinton, on Page 40 of Exhibit 42, you make the statement:

"Therefore, it is my judgment that Panhandle Eastern will not be justified in further producing gas from its

reserves in the Panhandle Field longer than 15 years from present."

Are you sure about that?

A. I am sure that that is my judgment.

Q. Are you certain about your judgment?

A. If my judgment did not lead me to believe that that was not approximately correct, I certainly would not say it.

Q. You are positive about the fact that Panhandle Eastern will not be justified in further producing gas from [fol. 5444] its reserves in the Panhandle Field longer than 15 years from the present, are you?

A. I am positive that that is my judgment of the time when the pressures will get down to the point indicated. The time element does not mean so much to me as the pressures.

Q. Are you sure about the time, 15 years?

A. Undoubtedly, that fifteen years is correct if it is in here, because that is the result of my judgment.

Mr. Goodman: By your judgment, do you mean according to your best knowledge and belief?

The Witness: Yes, sir.

Mr. Goodman: That is what you mean?

The Witness: Yes, sir.

Mr. Goodman: You think that it will not pay to extract gas from the Panhandle Field, according to your best knowledge and belief, beyond 15 years from the present?

The Witness: That is correct.

Mr. Goodman: And do you have in mind, also, certain conditions which would extend that time?

The Witness: Yes, there are many conditions which could arise which would extend that time. Any condition that would tend to curtail the amount of gas withdrawn would affect the total life of the field.

Mr. Littman: Would extend the life of the field?

The Witness: Any curtailment of withdrawal would [fol. 5445] extend the life, yes sir.

Mr. Goodman: Do you have in mind any conditions that would permit further withdrawal of gas beyond the quantities which you have estimated and beyond the 15-year period?

The Witness: Yes. If the manufacturer of carbon black was outlawed in the State, why, it would have a very strong influence on the field. Likewise—

Mr. Culton: (Interposing) By extending or shortening the life of the field?

The Witness: Extending, if it is curtailed. Likewise, if the line to Milwaukee, Wisconsin, now proposed and I believe awarded to the Phillips Petroleum Company, which was not considered in this study, was built and that gas was taken largely from the Panhandle reserve which, in all probability, it will be, why, then my calculations would be in error in the amount of the gas that Phillips takes.

Mr. Culton: Would that lengthen or shorten the life?

The Witness: That would shorten the life of the field.

Cross-Examination

By Mr. Goodman:

Q. Are there any other factors that would increase your ability to take gas beyond what you have estimated, either as to amount or as to time?

A. No, I cannot think of any that would affect it in that manner. If there should be placed upon the west sweet [fol. 5446] field a proration order, it would, in all probability, mean that the total amount of gas which we expect to get from that field would be decreased.

Q. Could you conceive that your rate of pressure decline might change?

A. Yes, I think it can go off more sharply than I have shown, because we have based that on present formation characteristics and, as this becomes lower, I feel that there is going to be considerable stoppage of the channels through the formation, better known as permeability, and the reason that I say that is that a very complete study of this water situation has been made in the Panhandle

Field by Mr. Hammerschmidt of the Texoma Natural Gas Company, and his conclusions lead me to believe that that is what is going to happen and, keeping in mind that we are speaking about the observed well-head pressure and not the equilibrium pressure, I would like to point out that at the time when we experience fairly low pressures at the well head; that there will be areas of much higher pressure which are located between the well bores.

Q. I am not sure that I understand your answer because, first you indicated that the pressure decline, or you indicated you could conceive that the pressure decline would accelerate more rapidly than you indicate.

A. Yes.

[fol. 5447] Q. And toward the end, you mentioned factors which I interpreted as limiting the rate of pressure decline.

A. No, that would hasten it; because, there will, without doubt, be great quantities of gas trapped in the Panhandle Field which will never be recovered, and to complete the answer to your question, the result of the lowering of the pressure in this field may produce a condition whereby the flow of gas through the formation will be decidedly retarded, thus giving a lower observed well-head pressure for the same rate of withdrawal.

Q. Are there any known processes to overcome this factor of impermeability at low pressures?

A. Yes, there are, but they are not far-reaching enough from the well bore to produce the result that would entirely do away with that situation.

Q. What are those processes?

A. The treatment of Limestone with hydrochloric acid.

Q. And you have resorted to that, have you not?

A. Yes.

Q. To what effect?

A. With an increase in the deliverability of the wells at the present pressures.

Q. And to what extend have you applied that treatment to existing wells in the Panhandle formation or in the Panhandle Field?

[fol. 5448] A. I believe that there is somewhere between 50 and 60 of the wells connected to our system that have been treated with acid.

Q. And to what extent does it pay to repeat or keep on that treatment?

A. From the only experience that I have had, I am [afrain] that we are not going to get good results by the repeating of acid treatment.

I refer to a treatment which was made on our Masterson 1-38 well in 1937, and the treatment was made by following the acid into the formation with a gas load. That is, a compressor was set up at the well head and the weight [and the weight] which forced the acid back into the formation was a straight gas load and that well never did clean up as we felt that it should have.

In other words, you can go out and open the well and still smell the spent or partially spent hydrochloric acid, so this year I put a treatment in that well of 2,000 gallons of 7½ percent acid and followed it with 6,000 gallons of water in an effort to clean out the area which had been acidized before and the result was that, to date, we have not received any gain in deliverability or open flow of that well.

Q. Is acidization the only known process of overcoming the factor of impermeability?

A. Well, that question would have to be answered in [fol. 5449] this respect or in this manner: There is another method of opening up the formation around the well bore, but that method is not as far-reaching as acid treating.

Q. In other words, acidization is the best known method?

A. Yes. The other method I referred to is the shooting of the well with nitroglycerin.

Mr. Culton: That is rather dangerous to the well in some formations, is it not?

The Witness: Yes, a well that has been shot with nitroglycerin will have a maintenance cost that is much higher than a well that has not been shot at all, and a well that has been treated with acid will show a lower maintenance cost than a well that has not been treated at all.

Mr. Culton: That difference is largely due to cavings?

The Witness: That is true, the cracking of the formation around the well bore, and particles falling off into the well bore.

By Mr. Goodman:

Q. You have mentioned your experience with old and exhausted and abandoned wells, is that right?

A. What is it?

Q. You have mentioned some experience in old, exhausted and abandoned wells, is that right?

A. Yes, in our Mo-Kan area.

[fol. 5450] Q. What type of area is that, that is, as to general capacity, small or large? A. Small.

Q. It is a small area?

A. Yes, not comparable with the Panhandle or Hugoton areas at all.

Q. In other words, it is quite a limited area and the conditions are not those found pertaining to the Panhandle area?

A. That is correct.

Q. Now, is the Louisiana area comparable?

A. In some respect, it is, but the size of the reservoir, the number of acres above the reservoir, is only a fractional part of the Panhandle Field.

Q. In other words, then, Panhandle is an individual case and its probable future is really speculative, isn't that so?

A. Yes, I would say that it is speculative, and giving the field the best of its possibilities, the greater part of the speculation lies on the under side.

Q. Is there such a thing affecting the migration of gas as a rate of permeability? A. Certainly.

Q. And have you considered such a factor in determining your judgment that the field will, in all probability, [fol. 5451] be abandoned in 15 years?

A. I have not said the field in all probability would be abandoned in 15 years.

Q. You have said that Panhandle Eastern would cease producing?

A. Yes, I feel that we can do better to produce our gas elsewhere at the end of 15 years, rather than make a capital expenditure that could be used for such a short time.

Q. Now, within 15 years, Mr. Hinton, there is a chance of the factor of rate of permeability helping conditions, isn't that so?

A. That has been given very thorough consideration.

Q. By whom?

A. By me, in my studies.

Q. To what extent?

A. To placing my idea of what the pressures will be through the various years.

Q. Where do you show that?

A. In my pressure curve.

Q. Well, in an exhibit that is—

A. (Interposing) I do not remember whether they were put in as an exhibit or not.

Q. Just a minute. Does that show in connection with your curve of rate of pressure decline? Is that factor evaluated in any way?

[fol. 5452] A. Yes, it is.

Q. In what way?

A. I refer you to Group Area "A" of Exhibit 46. The pressure drop in this group area would have been shown to be much sharper if it were not for the fact that there is comparatively low permeability in this particular area.

I give, for example, our Burnett wells located in Section 1-86 and Section 108 of Block 5, I & G. N. Survey, Carson County, Texas. There exists at this time a gradient of pressure from Burnett 1-86 to Burnett 108, a distance of approximately two miles, that is over 100 pounds.

Mr. Culton: Does that mean it is tight in there?

The Witness: That means it is very tight in there. The fact that when these wells are blown to atmosphere for testing or conditioning that we oftentimes take a pressure gage and put on as soon as the well is closed and then record the pressures at various intervals, usually 5, 10, 15, 20, and then we may skip and go on to an hour or two hours or three hours, and we find that the wells, in general, in this area, are slow to regain their closed-in wellhead pressure, whereas the wells located over in this section of the field, referring to Group Areas "G" and "F", show that there is, in general, high permeability in that portion of the field.

Trial Examiner: That is, you mean an equalized pressure is more quickly reached?

[fol. 5453] The Witness: That is correct, yes, sir.

Does that answer your question, Mr. Goodman?

By Mr. Goodman:

Q. Yes.

Now, in considering tendencies toward pressure equalization, how much of a time interval have you taken into consideration?

A. It is my opinion that when well-head pressures get down to 100 pounds or below, that it is not going to be very successfully carried on to produce a well greater than one-third of its total well hours, or, in other words, one-third of each month.

Q. Now, Mr. Hinton, you have distinguished between abandoning a field and seeking to produce gas. I presume you mean that you will maintain the power to produce some gas after the 15-year period?

A. That remains to be seen.

Q. In other words, you do not rule out the field for purposes of some ultimate production or use even at the end of 15 years, do you?

A. No, I think that it is possible that we could get some gas from a few of our wells, but by the time we paid the operating expense and the taxes on that property, why, I think the cost per M.c.f. would be far greater than that which we hope to receive for it at the purchase end of the line.

[fol. 5454] Q. Do you have in mind any particular use for the field after the 15-year period?

A. Yes. I think it will be used for short-distance pipe lines up to the time that the gasoline plants in the sour field have taken the greater portion of it and then the medium-distance lines will be abandoned and there will still be a great deal of gas left there for local consumption where the time element will not be important in the migration of that gas in areas away from the well bore into the well bore.

Q. In other words, there will be considerable productivity of the field but at a relatively low rate of output?

A. That is correct.

Q. So that at the end of the 15-year period, the field itself and your leases on the field might conceivably have substantial salvage value?

A. Yes, I think there will be some salvage value there.

Q. In other words, you could sell your rights, is that right?

A. No, I think you could probably turn the pulling of the pipe over to somebody for half of the value of the pipe.

Q. Well, the wells themselves would be capable of some production?

A. Yes, but here is the thing: At that stage of the [fol. 5455] depletion of the field, the companies that are connected to short-distance pipe lines will still be connected to their own development and as we cease to take gas from our acreage, there is certainly no reason why they should pay us any money for it, because as they take their gas away, what little we have left is going to eventually migrate over there to the extent it would not be a paying proposition for them to make a cash outlay for our acreage holdings.

Mr. Culton: They would also have to operate the pipe lines from our acreage over—

The Witness: (Interposing) Yes, and pay the taxes on it.

By Mr. Goodman:

Q. Now, in the figuring that you have done, and to the extent that you have done, have you given any consideration to all of the salvages realizable when you stop production in the Panhandle Field?

A. No, sir, that problem has not been given to me.

Mr. Goodman: That is all.

Cross-Examination.

By Mr. Lee:

Q. You said something about at the termination of the 15-year period, you would have to take your gas from elsewhere. What did you mean by that?

A. I mean that I believe that we can produce gas more cheaply and protect our reserve in the proper manner by [fol. 5456] switching production to the Hugoton Field

rather than continuing to produce that same amount of gas at a much higher cost which would have to be passed on to the public if we continued to operate in the Panhandle Field.

Q. Then do I understand that the idea that you have is that—at the present time you are working both of the fields?

A. That is correct.

Q. But you give a far greater life to the Hugoton Field?

A. Yes, sir.

Q. And do you give that greater life to the Hugoton Field considering you are working both fields now?

A. Yes, the total withdrawal from the Hugoton Field is less than 300 billion cubic feet right now, whereas the annual withdrawal from the Panhandle Field is more than twice the total withdrawal from the Hugoton Field to date.

Q. How much longer after the 15-year period would the life of the gas available go on?

A. Considering the number of acres which we have in this study, it is my opinion that we would not be safe in estimating a life longer than 25 years for that field.

Q. Is that 25 years beyond the 45 years or 25 years from the present?

A. 25 years in total.

[fol. 5457] Q. Now, of course, this estimate does not take into consideration any possibility of added acreage, does it?

A. No, sir, it does not.

Q. And is there a possibility of acquiring additional acreage that would tie into the Hugoton Field?

A. We are endeavoring to do that now as a safety factor.

Q. Then that 10-year period of life that you ascribe to the Hugoton Field beyond the 15 years you have ascribed, or it is vice versa, isn't it—yes, that is right—the 10-year period of life you have ascribed to the Hugoton Field beyond the 15-year life you ascribed to the Panhandle Field is subject to to an increase, to-wit, the 10-year period referred to by reason of the acquisition of additional acreage, isn't it?

A. That is correct, and I based by 10-year opinion on observations made in that field by me.

Q. Well now, in view of the fact that you think the reserves, so far as obtaining them in an economical manner in the Panhandle Field is concerned, will be limited to a 15-year period. Is that why your company is not seeking any further acreage in the Panhandle Field?

A. No, not exactly, Mr. Lee. It is a complicated problem to fit all of these different moves in, in such a manner that will enable the company to obtain the greatest amount [fol. 5458] of gas for the least cost.

Q. Now, generally speaking, without too much detail, I understand that you have limited the life of the Panhandle Field but you have great faith in an additional life for the Hugoton Field.

Therefore, is your company negotiating to acquire any more of the Panhandle Field now?

A. No.

Q. And that is the underlying reason for it, isn't it?

A. Yes, because the time that we would operate in that field would not be greatly affected by the addition of more acreage.

Q. And in addition to that, you are negotiating to enlarge your Hugoton Field because of the longer expectancy of life?

A. Life, that is correct, and certain facts that have come to light the past year on testing, makes us feel at this time that it is probably a good idea to add more acreage just as a matter of having a safety factor.

Q. Now, let's assume that you did add that acreage in Hugoton Field, and let's assume that the Panhandle Field has been abandoned.

The 15 years has rolled around. Are you going to have a source of supply equal to what you have now?

A. Yes, we will have if the acreage is as we hope it is.

[fol. 5459] Mr. Lee: That is all.

Cross-Examination (Continued).

By Mr. Littman:

Q. Mr. Hinton, is it your testimony that Panhandle Eastern Pipe Line Company will abandon its facilities in the Panhandle Field in the year 1956?

A. That would be my idea, that we would do away with our present system and utilize the pipe which now carries gas out of the Panhandle Field to other portions of the Hugoton Field where it will be needed.

Q. In 1956? A. Yes.

Q. And it is your testimony that Panhandle Eastern will not operate in the Panhandle Field after 1956?

A. Not as a long-distance pipe line.

Q. How will they operate in the Panhandle Field?

A. I do not know, that is something that would have to come which we do not know, and the reason I say that, they may be making silk stockings out of gas by 1956, and we might use it for that purpose.

What I mean is, there are a lot of things that can happen in the use of natural gas that we do not know about today and they undoubtedly will happen.

Q. Then you cannot testify that Panhandle Eastern will, in fact, abandon its facilities and operations in the [fol. 5460] Panhandle Field in the year 1956, can you?

A. As a long-distance pipe line company, I can say that that is going to be very close to the time.

Q. But you cannot say that as to their operations as a natural gas company?

A. Yes, I could say that as to their operations as a natural gas company. Any other use that is made of our natural gas, I feel would have to be in another category other than long-distance pipe line light and fuel sales.

Q. You are not saying that Panhandle Eastern could not continue to operate in that field after 1956 as a long-distance pipe-line company?

A. Not if they would choose to make disadvantageous expenditures.

Q. Now, you have stated the primaary reason for your 1956 abandonment, to-wit, is the economics in that year, am I correct?

A. Yes, that is correct.

Q. And the economics of the year 1956 is, of course, dependent upon the capital expenditures required to produce gas in that year, is that right, in large part?

A. Yes, I believe that you said that correctly.

Q. And you have made no study of that, have you?

A. As to the amount of capital expenditure required to produce gas after the year 1956?

[fol. 5461] Q. Yes.

A. Not in a detailed manner. It has been given considerable study.

Q. By whom?

A. By me.

Q. And what is the unit cost of the gas in 1956, according to your considerable study?

A. I am not able to name a probable unit cost of gas in 1956 after considerable study.

Q. Now, will you tell me how you can determine the economics of operation in 1956—

A. (Interposing) Common sense.

Q. (Continuing) —and after 1956, without knowing the unit cost in that year. You say, "common sense"?

A. Yes.

Q. How about the "crystal ball" you referred to a minute ago? Does that help you to get the answer too, Mr. Hinton?

A. I do not have to refer to the crystal ball in this instance.

Q. Not in this instance.

Now, you can say that you can tell without knowing the unit costs of operations in 1956, you can tell whether it is economical to operate?

A. Yes.

[fol. 5462] Q. You can. Now, how?

A. By just taking the operating expense and going back to the amount of gas that we would be able to take from these wells, assuming that the characteristics did not change on the wells, and they are not going to remain the same, and just putting those few things together, the amount of fuel required, the number of engine hours required to transport that amount of gas will—I just do not feel that I would even give it the consideration to go to a unit cost, because it is beyond the realm of good economics.

Q. Well, your idea of good economics and my idea of good economics and other people's idea of good economics may differ, Mr. Hinton.

Now, I want to know specifically what you considered, in dollars and cents, to arrive at your economics? I want you to tell me what you economics consist of.

A. I cannot give it to you in dollars and cents. My economics consist of going through the operations required and the amount of capital expenditure that would have to be installed to raise the volume that we could take from that field to a point where it would prove that we could not take gas cheaper from the Hugoton Field than there.

Q. That kind of general statement may satisfy you, Mr. Hinton, and may satisfy others, but it does not satisfy me.

Is that all the specific information that you can give us [fol. 5463] at this time with respect to the method and manner by which you arrived at your economics of abandonment in 1956?

A. I believe that is sufficient.

Q. That is the best you can do?

A. Well, as far as I am concerned, that is sufficient, and until proved otherwise by somebody else, I am going to stand on it.

. . . . . .

By Mr. Littman:

Q. Now, you had no trouble in arriving at this kind of general conclusion.

A. What do you mean I had no trouble?

Q. That you had no difficulty in arriving at the conclusion that Panhandle Eastern will not economically be able to produce gas in the Panhandle Field after 1956, did you?

A. Not a great deal.

Q. All right. And you also had not a great deal of difficulty in arriving at the very opposite conclusion, to-wit, that every other operator and every other pipe-line company in the field will be able to operate at full blast and at 100 percent of its 1948 capacity in 1956?

[fol. 5464] A. No, I think that is reasonably what will happen, as I have explained. The type of market for the use of the gas other than Panhandle Eastern is decidedly different than our picture in that field.

Q. You made no study in dollars and cents with respect to the economics of the operation of the other companies, did you, in the Panhandle Field?

A. Yes, I gave consideration to that and knowing it is just a choice with those companies, whether they want to continue to operate for another two or three years at a high cost of operation and make a little money, or our decision whether we want to continue to operate and try to make a reasonable profit as we are today, by moving into the Hugoton Field.

They have no reserve in Hugoton Field and their choice has to be whether they choose to make a little money or go out of business.

Q. All right. What is the unit cost of operation in the Hugoton Field in 1956 for Panhandle Eastern?

A. Considerably lower than it is in the Panhandle Field.

Q. In dollars and cents, please.

A. I cannot give it to you in dollars and cents.

Q. Can you come within 100 percent up or down, within the correct figure in dollars and cents?

[fol. 5465] A. Yes, I imagine I could.

Q. Have you made the calculation? A. I have not.

Q. Well, if you have made no calculations, what is it, a kind of loose estimate?

A. Any estimate has a certain degree of looseness, and especially long-distance estimates can be off.

Q. Now, in order to determine whether or not it is going to be economical for Panhandle Eastern to abandon its facilities in the Panhandle Field in 1956 and produce all of its gas out of the Hugoton Field, you must necessarily arrive at the conclusion that it is going to be more expensive to operate per M.c.f. in the Panhandle Field than in the Hugoton Field in 1956. Is that correct?

A. You say it is going to be more expensive to operate in the Panhandle Field than in the Hugoton Field?

Q. I am speaking of unit costs. Will it cost more per unit?

A. Yes, I think that has been definitely stated many times.

Q. All right. Let's have the unit cost of operation in the Panhandle Field in 1956 and let's have the unit cost of operation in the Hugoton Field in 1956. Do you know those?

A. No, I do not know them in cents, and I do not believe that anybody can give them exactly.

[fol. 5466] Q. Now, you made no study, in dollars and cents, of the economics of all other pipe line companies who, according to your judgment, will be able to blithely go along producing 100 percent of their peak requirements right down through the year 1956. Is that correct?

A. No, I did not, because I know more what type of markets that type of gas is going to be used for. I know those companies are going to be forced to make tremendous additional capital expenditures before 1956 occurs, and by making those additional capital expenditures, they will have them there available.

We are making our capital expenditures, outside of the minor expenditures, on the basis of trying to obtain from our reserve the probable amount of gas underlying them.

Q. Now, if these companies, these other pipe-line companies, did not make these tremendous capital expenditures through the future years, they would not be able to get the quantities of gas that you have estimated will be withdrawn by them in the future years?

A. That is right. Texoma would not be building their new station over just west of our Sneed station at this time.

Q. And the life of the Panhandle Field would be extended beyond the 15-year period, would it not?

A. As far as the life of the Panhandle Field, it would extend it. As far as the life of the Panhandle Eastern [fol. 5467] Field, it would not greatly influence it, because as soon as they stopped, we would take advantage and get that part of the gas that we could.

Q. That is your idea.

Mr. Wheat: When you said Panhandle Eastern Field, you meant the portions of the field in which Panhandle Eastern obtains its gas?

The Witness: Yes.

By Mr. Littman:

Q. You mean it would not affect Panhandle Eastern's picking up its stakes in 1956?

A. Not noticeably, no.

Q. If the field continued to operate for an additional ten years beyond 1956, you are still of the opinion that Panhandle Eastern would abandon its operations in the Panhandle Field in 1956?

A. Yes, because we will be producing gas at a lower cost in the Hugoton Field at that date.

Q. And in arriving at that conclusion, you made no—

A. (Interposing) Dollars and cents—

Q. (Continuing)—calculations of dollars and cents, did you?

A. Not per M.c.f., I did not.

Q. And you have no working papers to show how you arrived at it, do you?

[fol. 5468] A. No, I do not believe I need them.

Q. It is just a kind of a general idea, is it, of yours?

A. No, it is just something that anybody with any knowledge of the gas business knows is going to happen.

Q. Mr. Davis does not know it, does he? At least, he has not testified to it.

Mr. Culton: He said 15 years.

Mr. Littman: He did not.

Mr. Culton: In the last letter he filed, he did.

The Witness: I do not know.

Mr. Culton: He said he thought we had enough for 15 years and counsel knows it.

Mr. Littman: There is no such testimony in this proceeding, Mr. Culton, and that is the thing to which I am referring, is this record.

I am not talking about red herring prospectuses, to use the term which your own witness used.

Mr. Culton: Go ahead, go ahead.

By Mr. Littman:

Q. And Mr. Davis, in estimating approximately 70 percent greater reserves in the Panhandle Field, is wrong, and you are right, is that a correct statement?

A. In my opinion, my estimate is more nearly correct than Mr. Davis', but that is no reflection on Mr. Davis be-

[fol. 5469] cause without any doubt, he is one of the best

geologists and engineers throughout the United States as far as a general knowledge of every gas field in the United States is concerned.

Q. And his estimate of the remaining reserves in the Panhandle Field is 70 percent greater than yours, is that correct?

A. Did you take time to sit down and figure out the reservoir content required to hold that much gas?

Q. Mr. Hinton, I am asking you the questions. I am not being cross-examined.

Did Mr. Davis find the remaining reserves of the Panhandle Field as of the end of 1940 over 70 percent greater than your estimate?

A. I believe that is what you said the other day. I had not seen that estimate before, as I remember.

. . . . . .

[fol. 5470] By Mr. Littman:

Q. Mr. Hinton, in response to one of Mr. Lee's questions, you undertook to give an estimate of the life of the Hugoton Field, did you not?

A. Yes, I believe I gave it for a number of years.

Q. Now, I would like you to furnish us, since this is an entirely new subject for you in this proceeding, with all of your working papers showing the methods, manners and figures used by you in arriving at this estimate for the life of the Hugoton Field.

Do you have them with you?

A. I do not.

Q. Where are they now located?

A. I do not have working papers. That was an estimated figure.

Q. Now, I want you to tell us how you arrived at it, giving us the figures and the bases of your estimate, that is, if you propose to undertake to testify in this proceeding with respect to the life of the Hugoton Field.

. . . . . .

[fol. 5472] The Witness: I believe that I have told you several times that I have made no detailed estimate, but by observing the characteristics of the field based on the data which we have gathered, and knowing, in general,

what we could probably expect to happen in that field, I would say that in order to protect the interests of the Company, that capital expenditures at this time should be made on the basis of expecting to take gas from the Hugoton Field for a period of not longer than 25 years.

By Mr. Littman:

Q. Are you a geologist, Mr. Hinton?

A. No, sir.

Q. Now, will you give us the annual withdrawals that are expected to be made from the Hugoton Field from now to the day of death of its life, 25 years hence?

A. I will be happy to give them to you if it is possible for me to obtain them.

Q. Don't you have them among your working papers?

A. No, sir, I have them for no longer than a period of the next five years.

Q. You have no figures beyond the next five years?

A. No. That is all I could get from the Committee for Conservation, five years.

Q. Well, what figures with respect to annual with- [fol. 5473] drawals beyond the next five years did you use in arriving at this estimate of 25 years?

A. I used the amount of gas that Panhandle expects to withdraw from that field, and I can tell you in very short order that the problem in the Hugoton Field is going to be different than it was in the Panhandle Field, because we are not going to have the great benefit of migratory gas in that field.

We are going to be governed much more closely by the amount of gas in place.

Q. Well, let's have your withdrawal figures for Panhandle Eastern.

* * * * * * * * *

[fol. 5474] A. I believe there is an exhibit here, somewhere.

Mr. Culton: Mr. Morton's exhibits are the ones you are talking about, and they are for 15 years.

The Witness: It will be very easy to give because we have arrived at a constant load at the end of the 15-year

period, and that entire amount will be withdrawn from the Hugoton Field for the next 10 years, estimated.

By Mr. Littman:

Q. Now, where is this load for the next 15 years? Where does that appear in evidence? In one of the exhibits?

A. I believe so.

Mr. Culton: Exhibit 132.

The Witness: Those fields were divided in one of those exhibits and showed the percent that we expected—yes, that is shown in Exhibit 131, and for the next 10 years the amount of gas which Panhandle Eastern will expect to take from the Hugoton Field will be 117,031,551 M.c.f. per year.

By Mr. Littman:

Q. 117 million or 115 million? A. 117 million

Q. Where does that figure appear in Exhibit 131?

A. That is the total and we do not anticipate taking any more gas from the Panhandle Field after this period [fol. 5475] has been reached for the main line and, therefore, the total Hugoton Field withdrawal will be that amount.

Mr. Goodman: What paper are you reading from?

The Witness: Exhibit 131.

Mr. Goodman: I see. All right.

The Witness: From the column shown as "Total" under the "Total Main Line".

By Mr. Littman:

Q. Now, Mr. Hinton, the figures which you have read are not your estimates of withdrawals, are they?

A. No, those are Mr. Morton's estimates.

Q. And Mr. Morton hasn't testified to any such figure as 117 million M.c.f. in this proceeding, has he?

A. No, but he has furnished me with that estimate and it is in my working papers.

Mr. Culton: And that was put in evidence by Mr. Littman, wasn't it?

Mr. Littman: Oh, yes, as a part of your working papers?

The Witness: Yes.

By Mr. Littman:

Q. For the purpose of showing how you arrived at certain figures long prior to 1960? A. Yes, sir.

Q. Now, Mr. Morton did testify in these proceedings as to the amounts of sales for Panhandle Eastern for the [fol. 5476] next five years or 5½ years through 1946, I believe, did he not?

A. Yes, at least that far.

Q. And this so-called 25-year life is based upon a stepping up of the annual production beyond 1946 to as high as 117 million M.c.f. Is that right?

A. Yes, shown in the figures just requested by you.

* * * * * * * *

[fol. 5477] By Mr. Littman:

Q. At any rate, the 25-year so-called estimate of yours is predicated upon the annual total main line sales shown in the extreme right-hand column of Exhibit 131?

A. Yes, under the total, which is the last column of the group of three, shown as the "Total Main Line."

Q. And what reserves are you using in arriving at this 25-year estimate?

A. I am not using anybody's reserves because there is no reserve figure that has been established that will show that we can take that amount of gas from our acreage.

Q. And you made no such study, did you? A. Yes.

[fol. 5478] Q. What? You did make a study showing how much gas you can take from your reserves?

A. I know how much we can take down until the end of 1960 from an estimated reserve.

Q. Where are your working papers for that?

A. I shall try to find them in my intricate filing system.

Q. Don't bother to do it now.

A. I have it all worked out by percent, total estimated amount of reserve withdrawn by years. I think that is in the miscellaneous working papers.

If you would rather go on, I would be glad to look that up,—I know I have it—and show you the percent figures.

Q. Did you make the calculation after 1960 to get to the end of the 25 years?

A. No, I went and talked to the management about acquiring some more acreage, and that is what we are doing at this time.

Q. In arriving at this so-called estimate with respect to the life of the Hugoton Field, did you assume a decelerating rate of production per pound drop of decline in rock pressure?

A. No, I don't think that we will experience the same type of [decleration] as we are experiencing in the Panhandle Field at this time.

[fol. 5479] Q. You are going to have a new kind of variation from the application of Boyle's Law in the Hugoton Field?

A. I have never testified that there was any variation from Boyle's Law in any respect, and I would like it now to be understood that I am not questioning Boyle's Law in any manner whatsoever.

Q. Mr. Hinton, you didn't listen closely to my question. I said from the application of Boyle's Law.

A. I thought you said, "deviation," I am sorry.

Q. Deviation from the application of Boyle's Law to the data at hand?

A. No. Again, the pressure decline problem in the Hugoton Field for the Panhandle acreage will show a decidedly different trend than it does in the Panhandle Field of Texas, in my judgment.

Q. Well, maybe I can get at it in another way.

You were not requested by the company to make any estimate of the life of the Hugoton Field, were you, for purposes of this proceeding?

A. I don't recall. I am always making estimates of the probable life of the field and I am telling you that I just can't remember whether anybody asked me to or not, but I did a tremendous amount of work on the Hugoton Field and tried to apply the proper judgment on what the trend will be, based on the present data which has been obtained.

[fol. 5480] Q. Well, you didn't make any such study for the Hugoton Field as that which you have presented in this proceeding for the Panhandle Field, did you?

A. No, it would not be possible to make that type of estimate for the Hugoton Field at this time. The total amount of gas that has been withdrawn from that field to date is only about two percent of the total estimated reserve for that field.

Q. Mr. Ralph E. Davis has stated in a letter, addressed to the Panhandle Eastern Pipe Line Company, which is in evidence in this proceeding, that the life of the Hugoton Field was more than 25 years. Do you agree with that statement? A. Oh, absolutely.

Q. You do?

A. Yes. The life of the Hugoton Field will, in all probability, be far beyond 25 years, but the amount of gas which Panhandle Eastern has under lease and developed at this time will not last more than 25 years for the rate of withdrawals which we expect to have.

Q. I think I now understand your testimony, Mr. Hinton, that you are confining your 25-year estimate for Panhandle Eastern to the present reserves, to-wit, the gas acreage under lease presently by Panhandle Eastern and the leases subject to present gas purchase contracts?

[fol. 5481] A. Yes, the length could be governed by State regulation.

Q. I am afraid I don't understand the latter part of your answer.

A. I say, the time element could be governed by State regulation.

Q. And Panhandle Eastern, as you have already suggested, is going to go out and secure more reserves, are they not?

A. Yes, but in the even that we did have a proration order placed upon that field, which we would be forced to operate under, it would in all probability require that we connect a large number of wells which would be drilled by other vendors in order to furnish the amount of gas which we would require to supply our market demand.

Q. And, of course, the acquisition of more acreage and the acquisition of more reserves in the Hugoton Field would extend the 25-year period which you gave?

A. Yes, I hope so.

Q. And the reasonable expectation is that it would extend the 25 years?

A. Yes, the acquisition of additional acreage would have a more far-reaching influence in extending life than would the acquisition of acreage in the Panhandle Field of Texas.

* * * * * * * *

[fol. 5482] By Mr. Lee:

Q. Well, if you are so certain that the Panhandle Field, that is the company-owned acreage in the Panhandle Field, will be abandoned in ten years, and if you are so certain of the life of the Hugoton Field of not less than 25 years with your present acreage and considerably beyond 25 years with your present plus acquired acreage, then isn't it only the part of common sense, in order to continue to have the gas for this pipe line, that you should and will greatly increase your Hugoton acreage holdings?

A. That would be my idea, Mr. Lee.

Q. Sure. And that means that the investment in the pipe line—I am not talking about any Local Area pipe line, I am talking about the long-distance pipe line which is going to have a source of supply for a great many years beyond 25 years from now under your own ideas, isn't it?

A. If we are able to acquire the acreage, which is becoming very scarce in the Hugoton Field at this time.

Q. Yes, but even if you do not acquire the acreage, as I understand it, you do say that the reserves are sufficient [fol. 5483] for more than 25 years that you have now?

A. I would say that 25 years would cut it to a pretty fine point, because that is the reason that it was my recommendation that we acquire additional acreage, to be sure that we could have gas for 25 years.

Q. Well, there is just one more question that I would like to ask you.

Has the Panhandle Eastern Pipe Line Company actually been engaged, within recent years, in extending its acreage in the Hugoton Field?

A. No, we have not, because it is only the past two or three years that the market trend has been as it is, and if we were to remain upon the basic market, I would say that we had a very nice acreage picture to assure a 25-year supply of gas for main transmission line.

Mr. Culton: That is, you mean the market up to a year or two ago?

The Witness: Referring back to the exhibit, I believe it is 141, which shows the amounts of gas which we expect to take under the basic load condition.

By Mr. Lee:

Q. But just recently, at least within the last six months, perhaps nine months, you have entered into contracts that greatly enhance your market, to-wit, the contract with the Consumers Power in Michigan, haven't you?

[fol. 5484] A. Well, I don't know much about the detail of where the gas goes, Mr. Lee.

Q. Oh, but you do know this: As production manager, you know that there has been something done that is going to greatly increase the required production?

A. I certainly do.

Q. Sure.

A. But I don't know what percent goes to Consumers or any certain contract.

Q. No, but you do know that what has happened in the last nine months is that a contract has been entered into between your company and Consumers Power Company that results in a tremendous addition to your total output of gas? A. Oh, yes; yes, sir.

Q. Now, what I would like to ask you is this, just again, in view of that fact has the company been engaged, in recent months, in efforts to increase its acreage in either Panhandle or Hugoton or both?

A. We have made an effort to secure additional acreage in the Hugoton Field within that length of time stated, but no effort to increase the acreage in the Panhandle Field.

Mr. Culton: Have you actually succeeded in getting acreage?

The Witness: Yes, we have and the cost of securing that acreage is not reflected in the capital expenditure or [fol. 5485] operating cost in these studies.

By Mr. Lee:

Q. And how much was that additional acreage that you recently secured?

A. Well, I can't tell you just—

Q. (Interposing) Well, approximately.

A. Well, the acreage held by the Panhandle Eastern as of December 31, 1940, in the Texas and Hugoton fields for main line purposes was 227,845.95 acres; as of November 30, 1941, the total amount of acreage held by the Panhandle Eastern both operated and unoperated, in both the Panhandle Field and the Hugoton Field, was 254,802.69 acres.

Mr. Culton: That is an increase of how much?

The Witness: About 27,000 acres. I was going to say 30,000. That is the amount that I had in mind, but I thought I had better check it.

By Mr. Lee:

Q. Well, wait a minute. If you will pardon me, you said 227,845.95, December 31, 1940? A. Yes.

Q. And 254— A. (Interposing)—802.69.

Q. November 30, 1941? A. Yes.

Q. And what was the increase there?

[fol. 5486] A. About 27,000 acres.

Q. That is close enough. Now then, it will be the settled policy of the company, in view of the philosophy you have given us here about termination of uses in the two fields, to go on enlarging their holdings, won't it, in the Hugoton area?

A. By a few more thousand acres, but not in any substantial increases as is reflected in the figures which I just gave you.

Q. But that will be because you will feel that when you have taken a few more thousand acres, perhaps, at the outside 35, you have got such a reserve there for so many years that you feel you can rest a while on acquisition of new reserves?

A. Yes, and we will constantly be improving our acreage picture. By that I mean, whenever possible to obtain a lease on acreage which is conveniently located to our pipe-line system, that we will take that and in the event that we feel, as time goes along, that we can safely drop some acreage to cut down expenses, we will drop less desirable acreage and keep the more desirable acreage.

Q. All of which adds up to one thing, that your continuation in business is going to be, in your judgment, under that program, for far beyond the 25-year period from the present time?

[fol. 5487] A. I don't believe that we could justify any estimate in any gas field that has ever been discovered for a period longer than 25 years.

Q. No, but now wait a minute. You have given us 25 years to start with. Now, this enlargement of your holdings and the policy that you pursue is bound to result in the continuation of business at the present rate in excess of 25 years.

A. It was taken primarily as a safety factor and it should result in a longer life of the field in the event that in making a long-distance estimate of that nature we had not placed the proper value upon this reserve and it is much better to have a little too much than to be on the short end of the deal.

Q. I know.

Mr. Littman: You mean to have—

The Witness: (Interposing) Excess acreage.

Mr. Littman: To have a little excess acreage?

The Witness: Yes, sir.

By Mr. Lee:

Q. And it might be 30 years and if might 35 years?

A. It could be, but the data does not indicate that.

Q. What does it indicate to you, in your best judgment?

A. It indicates to me that the amount of gas that we are going to be able to take from the Hugoton Field is going [fol. 5488] to be much less than that which we are going to be able to take from the Panhandle Field, and, therefore, in order to obtain the Hugoton gas at the best conditions, it is going to be necessary to shift operations to that field at a fairly early date.

Mr. Lee: That is all.

Trial Examiner: Mr. McRee, have you questions?

Cross-Examination.

By Mr. McRee:

Q. Mr. Hinton, do you have a copy of Exhibit No. 134 there? A. Yes, I have it Mr. McRee.

Q. In arriving at your estimate for Condition "C", what factor did you take into consideration for the increase in withdrawals from 1941 during the subsequent years?

A. Estimated increases by the pipe line companies, only, and no increase in gasoline plant consumption or in the carbon black industry.

Q. I believe that Condition "C" anticipated that not only Panhandle Eastern but the other major producers in the field would experience a reasonable addition to their loads from time to time.

A. Yes, that is correct.

Q. By "reasonable additions to the load" just what did you mean?

A. Well, at the present time, it is my understanding [fol. 5489] that I am supposed to prepare at Mr. Littman's request a detail of the amounts taken by the various pipe line companies.

I believe that that came in in a package which I have not opened yet, my working papers I meant. I can hand you, or you can be furnished, a copy of that which, I believe, would answer your question.

In other words, I can't recall those figures offhand.

Q. Well, in the case of your own company, you anticipated, I assume, in Condition "A" that there would be some customers added to your line from time to time, did you not?

A. No, we just assumed that that was—

Q. (Interposing) I beg your pardon, I mean Conditions "B" and "C"?

A. Yes, in "B" and "C" that was considered.

Mr. Littman: Pardon. May I interrupt to just clear up one point?

Mr. McRee: Yes.

Mr. Littman: Am I correct in stating that your Exhibit 141 shows the breakdown of your withdrawal figures under Condition "C", which are shown in Exhibit 134 in Column 11?

The Witness: Yes, they do.

Mr. Littman: That is under Condition "C" only?

The Witness: That is correct. I thought about making those for all three, but you had talked about "C" and we had agreed that we thought that that was what was going [fol. 5490] to happen, so I did not make three separate exhibits.

Mr. Littman: Well, I believe that my interrogation on cross-examination showed pretty clearly how you arrived at your annual withdrawals for Condition "B".

The Witness: Yes.

Mr. Littman: Pardon the interruption, Mr. McRee.

By Mr. McRee:

Q. Did your anticipated withdrawals under Condition "C" take into consideration that the other companies might also add customers from time to time?

A. Under Condition "C"?

Q. Yes.

A. Yes. It shows an increase for those companies for the first five years. Thereafter no increase. You will note that the amounts from 1945 through the year 1948 are constant, a total of 679,000 M. M. c. f. per year and after that date they drop off in the proportion that the Panhandle Eastern expects to retard their withdrawal.

Q. That is true, but the difference between Columns "B" and "C" would reflect the increase in load of the companies other than Panhandle, wouldn't it?

A. Yes, that is correct.

Q. So that from 1946 the other companies in the field would experience, under this estimate, an additional load of 53 billion cubic feet?

[fol. 5491] A. That is right, 53 billion cubic feet.

Q. And a similar amount during the following year?

A. You refer to the year 1947?

Q. Yes.

A. Yes, that is correct. I believe those figures are correct.

. . . . . .

[fol. 5511] By Mr. Culton:

. . . . . .

[fol. 5515] Q. You have named the principal pipe-line companies taking gas out of that field, have you not, out of the west field?

A. Yes, the principal ones.

. . . . . .

Q. Now, will [just] just outline in general—this question may be a little repetitious, but I am going to ask the same question with respect to the other companies—outline, in general, the area from which the Canadian River [fol. 5516] and the affiliated companies supplying gas to Denver or to the South Plains obtain their gas from that field?

A. The major part of the gas used by that company is obtained from an area including the southern part of Group Area "F" and to the area immediately south of there.

Q. You are referring to the group areas marked on Exhibit 46, as well as outlined on that copy of 26 which refer to group areas?

A. That is true. Canadian River also has some development over in the west edge of Carson County.

Q. Is that along the south side of the field?

. . . . . .

A. North of the fault line.

Q. Is some of it in Area "A" or is it all—

A. (Interposing) No, I do not believe that Canadian River has any development over as far as the west edge of Area "A".

Q. It would be south of "B", then?

A. And in "B", also.

Q. They have some in "B" and some in "F". They have some in "E"?

A. Yes.

Q. And the rest of theirs, in general, is south and west of those areas which we have just described?

[fol. 5517] A. That is correct.

Q. Now, where are the areas from which Texoma takes most of its gas? You have already referred us as to where a fourth of it comes from, the Canadian River properties. Where does the remaining three-fourths of Texoma's gas come from?

A. From acreage which is located in Carson County and in pretty well all over Moore County in the sweet gas area and they have, I believe, some scattering acreage right the county line, that being the county line between Moore County and Potter County.

Q. With respect to Area "G", do they have substantial acreage in that area?

A. They do. They have substantial acreage in that area and in all areas surrounding Group Area "G".

Q. How about "C"? Do they have some acres in "C"?

A. Yes, they have some small amount, but it is not in any great amount.

Q. How about "A"?

A. They have considerable acreage in Group Area "A" and also acreage to the east of Group Area "A".

Q. And from what points does Cities Service produce most of its gas?

A. From Group Area "A" and areas surrounding Group Area "A".

[fol. 5518] Q. Where does Panhandle Eastern get its supply?

A. Well, I believe the best way to term it would be to say the heart of the west sweet field.

That is, by the heart I mean the center, in general, from an area extending over to a point on the east side in about the central northern part of Carson County and extending west into Potter County and in Moore County.

Q. Well, it is in various portions of the areas "A" to "G" shown on Exhibit 46, is it not?

A. Exhibit 26, I believe.

Q. Also on 46, is it not? A. Yes.

Q. Now, are its wells very numerous in Area "A"?

A. No, I would not call that an intensive development at all.

Q. How about "B"?

A. No, we are sparsely developed in Area "B".

Q. Where is your densest production? That is, where is your greatest number of wells for the acres involved?

A. I believe, in Group Area "G".

Q. And your principal competition in Group Area "G" is with Texoma Natural Gas Company, is that correct, so far as the area itself is concerned?

A. Yes, the Texoma Natural Gas Company, and the Shamrock Oil and Gas Company.

[fol. 5519] Q. You have some of the Shamrock wells yourself, do you not?

A. Yes, we do, some very nice wells.

Q. I notice that on that pressure map, Exhibit 26, the pressures have commenced to drop substantially in the north part of the field, up in the north central and northeastern Moore County and northwestern Hutchinson County.

What has been the cause of that pressure drop which has taken place up there?

A. The heavy withdrawal from that area—

Q. (Interposing) For what use?

A. For the carbon black industry.

Q. The change in pressure, then, is largely the result of production of sour gas, rather than the production of sweet gas?

A. Yes, there are a number of locations to the south of the sour gas field which have not been drilled to date, thus making the withdrawal comparatively light in the sweet field immediately south of the sour gas line.

Q. What competitive companies exist in Area "F" with which Panhandle Eastern's acreage has to compete on withdrawals?

A. The Texoma Natural Gas Company and the Canadian River Gas Company.

Q. And in Area "E"?

A. Principally the Canadian River and some Texoma.

[fol. 5520] Q. In Area "D"?

A. In Area "D", the Texoma and there are some wells that have been drilled in Area "D" especially just to the east of it, which were used for gasoline plant extraction in the early days of the field.

Q. What is the cause of the pressure reduction situation which now exists in Area D? There seems to have been a substantial pressure reduction in Area "D".

* * * * * * * *

A. (Continuing) That is due to the heavy withdrawal to the east and southeast and also to the north and northwest.

Q. Has the gas withdrawal from wells within Area "D", in your opinion, been sufficient to cause the pressure reduction which is shown for that area?

A. No, I do not think that the pressure reduction is entirely due to the withdrawal from the Group Area "D" proper.

Q. You think it has been influenced some by the withdrawals to the east?

A. Yes. However, Group Area "D" is not a highly productive area.

Q. What size wells are ordinarily found in that area, do you recall?

A. It is a very rare thing if a well has a natural open flow greater than 10 million cubic feet per 24 hours.

[fol. 5521] Q. Are those wells' open flows frequently increased by acidization?

A. Yes, they are. However, in this particular area, Group Area "D", we are having considerable trouble with four of our wells at this time.

It is almost impossible to get those wells free enough from water to take a back-pressure open flow test.

* * * * * * * * *

Q. Now, the Area "E", what competitive conditions exist in that area?

A. Canadian River is the other company that takes gas in great quantities.

Q. So the principal competition in that area is with Canadian River Gas Company, is that right? A. Yes.

Now, in the north edge of "E", Texoma has a development but, in the south edge, it is only Canadian River.

Q. I see. You said something a while ago to the effect that the wells in the north part of the Canadian River acreage are more closely drilled than the wells in the south part of the acreage.

A. Yes, that is true.

* * * * * * * * *

[fol. 5522] Q. Now, I believe you stated that in the first portion of the study which you made—first, I failed to inquire about the competitive conditions in Area "C". What other companies do you find yourself in competition with in that area?

[fol. 5523] A. Well, the Cities Service and the Shamrock, the Texoma, the Huber Petroleum Company, all have wells located in that area, but the principal competition is from the migration of gas to the lower-pressure area lying to the east.

Q. And what is the cause of that migration? What is the fundamental cause for it?

A. Because gas always flows from an area of high pressure to an area of low pressure.

Q. What has caused the low-pressure area lying to the east?

A. Well, my opinion is that the amount of low-pressure acreage shown there has been caused by the production of the gas from the Panhandle gas fields in conjunction with the oil from the Panhandle gas field.

I think there, in all probability, has been great quantities of gas produced in that manner to the area east.

Q. And what has been done with that gas?

A. It has principally been blown to the air.

* * * * * * * *

[fol. 5525] Q. Now, Area "A".

Will you tell us what the competitive conditions are in that area?

A. Area "A" supplies a great deal of gas to Cities Service and to Texoma Natural Gas Company for the Natural Gas Pipe Line Company of America and, again, in Area "A", there is a migration of gas to the north and northeast which has, in my opinion, been retarded greatly by the fact that the data indicates that the permeability in Group Area "A" is quite low.

* * * * * * * *

[fol. 5530] Q. Mr. Hinton, along the northeast line of Exhibit 26, I see an uncolored area that has a good many dots on it. A. Yes.

Q. What is that area?

A. That is the northern part of the oil area which extends from the Town of Pampa, Texas, in a northwesterly direction to a point in central northwestern Hutchinson County.

Q. Is all of the oil area shown along that uncolored portion? A. No, it is not.

Q. What is the distinction between the oil area shown along that uncolored portion and the oil area which is within the colored boundaries?

A. That is the oil area of the Panhandle Field where no gas is encountered in the upper formation.

Q. In other words, in drilling down, they go through no gas and just hit oil, first? A. That is right.

Q. Is that a substantial acreage? A. Yes, that is.

* * * * * * * *

[fol. 5569] C. H. Hixton, a witness, having been previously duly sworn, resumed the stand and testified further as follows:

Redirect Examination.

By Mr. Culton:

* * * * * * * *

[fol. 5695] Q. I see. Now, we have been discussing the question of horsepower just a little bit. I want to go into that in a little more detail. Of course, it is a kindergarten expression that gas flows from an area of high pressure to an area of low pressure and will not flow unless there is a difference in the two pressures?

A. That is right, the same as water.

Q. Is it necessary to use methods for changing pressures so as to bring about better flow conditions?

A. You mean to create a pressure gradient?

Q. That is right, so flow will take place.

A. It is necessary.

[fol. 5696] Q. And how is that done in the operation of a pipe line?

A. By taking gas into a cylinder at a lower pressure than the pressure at which it is stored in a pipe line or tank and by moving that cylinder into an area of less cubic inches, to force the gas out at a higher pressure and thus, repeating the operation, create a pressure hole in the storage tank or pipe line and allow gas from other parts of that storage tank or pipe line to flow into the area of lower pressure.

Q. Into the area of lower pressure? A. Yes.

Q. And what methods can be used for the purpose of stepping up those pressures, that is, do you have to do it all at the end of the line or can you do part of it—I mean at the intake of the compressor station, or can you do it at the wellhead?

A. It can be done at any place.

Q. Or at any place along the line, is that right?

A. Yes, sir, that is right. The determination of the proper place is the important thing.

Q. Now, how is that determination made?

A. By obtaining the pressure drop which will occur in the pipe line system by the transportation of the required volume of gas.

[fol. 5697] Q. Is that another place where you take into consideration the economics of different methods of providing your change in pressures?

A Yes, sir, that is. It is necessary that the development of the system be [studies] in such a manner as will permit probably the installation of one compressor station to handle several wells instead of the requiring of the installation of a compressor station at each well.

Q. In other words, it is sometimes more economical to have a compressor at the well or at a group of wells to take that gas and put it into the pipe line at higher pressures, and in other instances it may be more convenient to have a compressor station along the gathering lines, and in other instances it might be more convenient to install your additional power at the general compressor station in which the gathering lines converge. Is that correct?

A. That is right, and unless the problem has been thoroughly studied, it will often result in the requirement that horsepower be installed under each of the plans which you mentioned, that is, namely, at the well or to handle a group of wells along the line at some point and also in at the main station.

Q. Now, of course, it is also kindergarten knowledge that, as the pressures are lowered, less volumes of gas will be in the pipe line than the volumes at the higher pressure.

[fol. 5698] What I mean is, that greater volumes of gas will cause higher pressures in the pipe line?

A. That is right.

Q. And does that principle have anything to do with the economics of operating a pipe line system as the field pressures go down?

A. Yes, it does, because, of course, as the pipe line is designed, so is the pressure drop in proportion to the size of the pipe line in relation to the volumes transported, and if the pipe line was under-designed to begin with, it means that the capacity of that line will have to be increased to carry additional volumes of gas.

Q. Now, you have testified that one method of increasing the pipe line is the addition of power. Is it sometimes necessary to increase the capacity by other methods?

A. That is right.

Q. What other methods? A. By looping.

Q. In other words, putting in more pipe?

A. By putting in more pipe.

Trial Examiner: Let me ask how many cubic feet of 14.65 gas is required to make a cubic foot of 500-pound gas?

The Witness: Do you mean how many atmospheres?

Trial Examiner: Yes.

Trial Examiner: We talk in terms of 16.4 and usually [fol. 3699] consider 30 atmospheres. It is 34.13 atmospheres.

Trial Examiner: So that approximately 35 cubic feet of gas at atmospheric pressure is compressed to one cubic foot?

The Witness: That is right.

Mr. Culton: At a 500 pound pipe line?

The Witness: Yes.

Mr. Culton: At any 500-pound pressure; where compressed to higher pressures, it would be far in excess of that?

The Witness: Yes. As that 500 would be increased by the amount of 14.65, it would mean that an additional cubic foot of gas would be stored in the same space.

Trial Examiner: So that your whole problem in filling your pipe line at Liberal is to provide a volume of gas that will produce that result and keep a continuous flow?

The Witness: Not on the intake side of the station. That is so that there will be enough gas come in that will provide that condition at the discharge side of the Liberal station, the 500 pounds.

Mr. Culton: In other words, the Examiner means you have got to get it in from your different lines in enough volume so that when it goes out, there will be enough for 500 pounds. That is the point.

Trial Examiner: That is right, and at the rate of flow the 500 pounds would produce in the pipe line.

The Witness: That is right.

[fol. 5700] By Mr. Culton:

Q. Now, are all of these questions that you have been [discussion] concerning the different methods of providing power and so forth, methods that were taken into consideration by you in determining the necessary expenses that the company would be required to incur and the necessary additional capital expenditures which the company would be required to make over the period of the next five years even to produce and transport the same volumes of gas which it now produces and transports?

A. Under the basic—

Q. (Interposing) Under the basic load.

A. That is correct, with the exception of the wells which are to be drilled in the Panhandle Field and that will lower our operating cost, in all probability, and we will make a considerable saving in the cutting out of a renewal bonus on that acreage, so I feel that the saving which the company will accomplish by drilling those will pay a nice return on the investment required.

Q. In other words, in all of these computations, you have had in mind the different things you have been discussing and have attempted to determine the most economical method under which the company should operate its properties down there, first, if it were not going to have an increase in production in markets and, second, taking into account the increases in its markets which the

[fol. 5701] company expects, as evidenced by Mr. Morton's estimate?

A. Yes, I would say that everything had been given careful consideration.

* * * * * * * *

Mr. Lee: Is your company the largest holder of acreage in the Panhandle Field?

The Witness: No. We are second to the smallest of the major pipe line companies.

Mr. Lee: And how many of the major companies hold acreage in the Panhandle Field?

* * * * * * * *

Mr. Culton: (Interposing) Name them off in the order of their ownership and acreage. That is probably what Mr. Lee would like.

Mr. Lee: I just wanted to get generally understood what your position was in that field.

Mr. Culton: I think it would improve the record if that were to be done. I suggest you name the companies in the order of acreage as near as you can.

The Witness: I do not have those acreages here in [fol. 5702] shape that I can read them readily off, but I know them.

* * * * * * * *

The Witness: In general, Canadian River Gas Company has a holding of between 205 and 210 thousand acres in the Panhandle Field.

* * * * * * * *

The Witness: The Texoma is around 160,000 acres; Cities Service around 120,000 acres and the Panhandle Eastern about 65,000 acres; and Northern Natural is about 1,000 below us, or was, the last time I counted this up, 64,000 acres.

Trial Examiner: And your holdings, as I recall, constitute approximately 4½ percent of the total acreage?

The Witness: Yes, of the total field.

Mr. Littman: Mr. Hinton, there are at least four more major pipe line companies operating in the Panhandle Field, are there not? You named them the other day.

Mr. Culton: He named some in the east field.

The Witness: The Phillips Company in the east field there and Lone Star is out of the east field. I do not believe that I have missed any.

[fol. 5703] Mr. Culton: Consoldiated, but it has only small acreage, hasn't it?

The Witness: It is not in our picture. We throw it the class of "Others." In other words, about two years ago I took all of these acreages and made a study to show how much gas Panhandle Eastern would be able to produce if the then talked of proration order was placed upon the field which was based upon a formula of allocation, dividing the total production into two parts and giving two-thirds of the total production allocation on the basis of acres times pressure, and one-third on the basis of potential, and I believe that those companies that I named are the only ones that I included and all the other acreage was thrown in the classification of "Others."

I probably mentioned Hagy, Harrington & Marsh.

Mr. Littman: No, you mentioned, among others, United Gas Pipe Line Company. Where does that one operate and where is acreage?

Mr. Culton: They only have 18 million a day.

The Witness: It is a small acreage, but I cannot think were United goes.

Mr. Culton: I think you will find that is the one that goes to Wichita Falls.

The Witness: I get United and Lone Star confused.

Mr. Culton: Lone Star goes to points in Oklahoma [fol. 5704] from the Panhandle Field.

Mr. Littman: You mentioned Consolidated Gas Company and also the West Texas Gas Company.

Mr. Culton: Consolidated Gas Company has about 5,000 acres.

. . . . . .

Mr. Culton: (Interposing) West Texas Gas Company is a part of the [Candian] river setup.

The Witness: The Red River holdings and the Canadian River and the Southwest Development—

Mr. Culton: (Interposing) And the Southwest Development Company.

The Witness: (Continuing) Are all one family.

Mr. Culton: In other words, all of those companies operate either as producers or as transporters out of what you have referred to as the Canadian River acreage.

The Witness: Yes.

Mr. Culton: Which is the largest ownership of acreage in the field.

The Witness: Yes, the Canadian River Gas Company owns as much acreage as the Northern Natural and the Panhandle Eastern and the Cities Service put together in that field.

Mr. Littman: Perhaps if you were to tell us what you mean by the term "Canadian River Company", it might clarify the record.

[fol. 5705] Tell us whether you mean Canadian River and certain other subsidiaries that I have named.

The Witness: The Canadian River is the producing company for the Colorado Natural Gas Company.

Mr. Littman: Does it include the acreage of Consoldated Gas Company?

The Witness: No.

Mr. Littman: Or West Texas Gas Company?

The Witness: Yes.

Mr. Littman: It does?

The Witness: That is acreage held under the name of Canadian River and Red River and Southwest Development also falls in that class. That is all.

Mr. Culton: Mr. Littman, the Consolidated Gas Company is just a little company over in the east field that

has a very few wells which takes gas to Wichita, Kansas. It is not connected with Canadian River at all.

Mr. Littman: I see. The reason I have been using these names is simply because the Texas Railroad Commission refers to these as the nine major pipe line companies.

* * * * * * * * *

By Mr. Culton:

Q. For Mr. Lee's information, Mr. Hinton, I will ask [fol. 5706] if this is not correct, that the Canadian River Gas Company has the largest amount of acreage?

A. That is correct.

Q. And by the Canadian River Company you refer to Canadian River and its association companies, the West Texas Gas Company, the Red River Gas Company and Southwest Development Company and you do not undertake to say what the proportion is between those different companies?

A. I believe that the West Texas Gas Company should not be included in there as it is the transportating company and not a producing company.

Q. That is right. Now, the next in ownership of acreage, as you understand it, is the Texoma Natural Gas Company.

A. That is correct.

Q. And the next to that is the Cities Service Gas Company? A. That is correct.

Q. Next to that is Panhandle Eastern?

A. Panhandle Eastern.

Q. And next to that is Northern Natural?

A. Yes, and then there are 19 other small pipe lines running out of there.

Q. With only a few thousand acres each?

A. That has a total acreage which is equivalent to approximately Panhandle Eastern's or, as I remember, [fol. 5707] 74,000 acres, 10,000 more than we have, the other 19 companies.

Q. Now, the United Gas Company and the Lone Star Gas Company mentioned by the Railroad Commission in its report all operate only out of the east field?

A. That is right and I have never had the time to get the east field acreage and make a comparison, but I do have a map that shows the ownership in the east field colored showing the holdings of each company and I had that colored from records that are kept in the gas offices in Texas and referred to it from time to time.

Q. Now, you referred to the Hagy, Harrington & Marsh Company. It has a substantial gas acreage which is tied to the Northern Natural?

A. Yes, and it also has some acreage which is not yet developed.

Q. Then, in addition, there is the Phillips Petroleum Company, which is a large owner of various types of acreage in the field?

A. But sells gas after it is stripped for gasoline to the Northern Natural Gas and does not transport gas from its holdings to any distant market.

Q. That is right, but if you consider major gas companies as meaning major producers of gas in the field and relating it both to sour gas and sweet gas, then the Phillips Petroleum Company is right up close to the top, is it not?

[fol. 5708] A. Yes, they would certainly fall in the class of major companies.

* * * * * * * * *

[fol. 5711] C. H. Hinton, a witness, having been previously duly sworn, resumed the stand and testified further as follows:

Redirect Examination (Continued).

By Mr. Culton:

Q. Mr. Hinton, at our adjournment yesterday afternoon, we had just reached the Hugoton Field and we were preparing to talk a little bit about the gas situation in the States of Kansas, Oklahoma and Sherman and Hansford counties, Texas.

* * * * * * * * *

[fol. 5713] Q. Will you point out on Exhibit 26, using language that will be understandable in the record, the areas in Kansas in which Panhandle Eastern is now producing gas?

A. Panhandle Eastern now produces gas from the west half, in general, of Stevens County, the extreme east portion of Morton County and the south central portion of Grant County, with the addition of some wells held by gas purchase contracts which are located in the southwest portion of Haskell County.

By Mr. Culton:

Q. No. 26 is the rock-pressure map, No. 20 the company-ownership map as of June, 1941, and No. 44 is your [fol. 5714] future development map. Is that correct?

A. That is correct, I believe, other than that I don't recall you naming the data, the source of the data or the date of the tests on which Exhibit No. 26 is based.

Q. When was that? A. I think it is 1940.

. . . . . .

By Mr. Culton:

Q. Now, do the colors on those three maps all have the same signification or are they of different meanings?

Q. They are of different meanings.

Q. Therefore, you can't use the color on one map in comparing the color on the other?

A. No, other than the undeveloped acreage shown on Exhibit 44 shown in the same color for the Panhandle acreage, as shown on Exhibit No. 20.

Q. That is a pink color, is it not?

A. That is a pink color.

Q. And by "undeveloped acreage", you mean acreage that will not be developed due to the period covered by your capital-expenditure study?

A. Yes, sir.

Q. The pink color on Exhibit No. 20 represents all of the company acreage at this time?

[fol. 5715] A. Yes. Also, all the acreage held under gas purchase contracts. It can be noted that there is a considerable group of acreage which is shown in yellow and red with a diagonal line running through each piece.

That acreage is owned 50 percent by the Panhandle Eastern Pipe Line Company and 50 percent by the Saturn Oil and Gas Company or the Southwest Oil and Gas Company.

Q. And gas purchased is in green, is it not?

A. Yes, sir.

Q. By that diagonal line that you speak of, that is where there is a 50-percent ownership by Panhandle Eastern and 50-percent ownership by these other companies?

A. Yes, sir.

Q. Now, will you point out on Exhibit No. 26 the first area which Panhandle Eastern developed in the Hugoton Field?

A. Yes. The first, or the discovery well, was drilled in Section 31 of Township 33, Range 37, Stevens County, Kansas, by W. L. Sidwell, and I believe that he was assisted in that by Mr. H. W. McNabb.

Q. When was that, do you recall? A. 1927.

Q. And Panhandle Eastern subsequently [acquire] some of that acreage?

A. Yes, after a considerable time spent in securing markets, Panhandle Eastern obtained a one-half interest [fol. 5716] in that well and has an ownership of one-half interest in that well at the present time.

Q. Was there some other acreage of that same classification at that time?

A. Yes, there were two general groups of acreage which were included in the contract known as the Argus contract, and they were not definitely outlined, but a list of acreage was furnished at that time to show which acreage should be dedicated to the supply required by the Argus Company.

Q. And is that block of acreage largely in the same general territory in the Hugoton Field?

A. Yes, sir, that is in the southern-southwest Stevens County.

Q. Does that area represent the area of the greatest activity on the part of Panhandle Eastern?

A. Not only Panhandle Eastern but other companies which are withdrawing gas from the Hugoton Field at this time.

Q. What other companies?

A. There are located in this general area 91 wells which are owned by the Republic Natural Gas Company.

Q. And where does it sell its gas?

A. To the Northern Natural Gas Company.

Q. All right.

A. And the wells owned by Panhandle Eastern, which supply the main line, and the wells owned by Panhandle

[fol. 5717] Eastern and jointly with the Stevens County Oil and Gas Company and the Southwest Kansas Oil and Gas Company, which furnish gas to the Argus Natural Gas Company.

Q. Where does the Argus market its gas?

A. Well, the principal market is Dodge City, Kansas. One of the big industrial markets is the sugar-beet plants located at Garden City, Kansas.

Q. Is that company connected with any other natural gas pipe line company?

A. Yes, that is a subsidiary company of the Northern Natural Gas Company.

Q. And during the period Panhandle Eastern has been taking gas from the area which you have just described, what has been the nature of the production, that is, has it been a heavy production or a light production?

A. No, sir, it has not been a heavy production. The withdrawal has yet to reach an average of 100 million cubic feet [a day] of gas per day, unless that happened the last six months of 1941.

Q. In other words, it has been area of low withdrawals from the beginning, is that correct, from an acreage standpoint?

. . . . . .

[fol. 5720] Q. Now, in your judgment, will the pressure declines resulting from production be felt further away in the Panhandle reservoir than in the Hugoton reservoir?

Mr. Littman: Just a minute. I object to that. I don't think this witness is qualified to answer that question.

By Mr. Culton:

Q. Well, is there any difference in the indicated permeability of the formation?

A. Yes, there is a decided difference.

Q. What effect does that difference have?

A. In order to answer that question, it would be nec-
[fol. 5721] essary to compare the fields on the basis of the same rate of withdrawal.

Q. All right.

A. If we had the same rate of withdrawal in the Hugoton Field as we do in the Texas field, it would be necessary to have a great many more wells in the Hugoton

Field than would be necessary in the Panhandle Field of Texas, therefore, the development would be spread over a greater number of acres and the withdrawal would probably cover a much greater territory with reference to pressure decline.

Q. Will it take longer for the wells to build up in the Hugoton Field than in the Panhandle Field?

A. As an average, it takes a great deal longer for the Hugoton wells to build up than it does for the Panhandle wells to build up.

Q. Now, what do you mean by the words "build up"?

A. The term "build up" denotes the length of time that is required for a well to regain its official closed-in pressure.

Mr. Littman: Why is that the fact, Mr. Hinton? Do you mind if he explains that?

* * * * * * * * *

The Witness: That is due to the tightness of the formation and the low permeability which restricts the rate of flow in the Hugoton Field, whereas in the Texas field, why [fol. 5722] there is higher permeability, especially in the Moore and Potter county portion of the field.

Mr. Littman: In other words, you mean that the permeability of the pay sands is greater in the Panhandle Field than in the Hugoton Field on the average?

The Witness: Yes, as so indicated by the build-up pressure data.

By Mr. Culton:

Q. You are referring to the fact that out of this Stevens County area, Panhandle Eastern has two markets, one, its market to the Argus Pipe Line Company furnishing gas for use for the Northern Natural subsidiary, and the other to Panhandle Eastern's main line. Where does Panhandle Eastern deliver the Argus gas?

A. At the wellhead.

Q. In other words, the Argus has its own pipe line and picks up the gas at the well?

A. When I say the "wellhead", I mean that it is a distance of some 50 to 70 feet from the wellhead as it is measured at that point and the exchange, of course, is made on the metered quantities.

Q. And how does Panhandle Eastern transport the gas which is used for its main line, that is, the gas which is produced in the Stevens County area which you have just described?

A. The major portion of the gas produced in the Ste-
[fol. 5723] vens County area travels in almost a due easterly course from a point in the gathering system, which is about four miles west of the southwest corner of the Town of Hugoton, Kansas.

Q. Does the Panhandle Eastern own all of its gathering system there? A. Yes, sir, it does.

* * * * * * * *

But there is, also, at certain times an amount of gas that travels up through a 10-inch line which commences in Section 24, Township 33, Range 39 and is laid in a northeasterly direction to a point in Section 4, Township 33, Range 37, both in Stevens County, and thence in an easterly direction through a looped 12-inch line over to a point in Section 4, Township 31, Range 36, where the looped 12-inch line changes in size to a single 16-inch line.

It then travels up to a point in the northwest quarter of Section 28, Township 30, Range 34, located in Haskell County and at that point it is connected to an 18-inch line which goes in a southeasterly direction down to the Liberal compressor station.

Q. In other words, Panhandle Eastern has a block of acreage there in Stevens County, Kansas, as shown on Exhibit No. 20, and a considerable portion of that has been developed by the drilling of wells. Is that correct?

A. That is correct.

[fol. 5724] Q. And part of the gas from those wells goes in an easterly direction and ties into the main line at Liberal?

A. It goes into the intake side of the Liberal compressor station.

Q. And the rest of the gas goes in a northeasterly direction and makes a connection with another gathering line of Panhandle Eastern's and then goes in a southeasterly direction to Liberal. Is that correct?

A. That is right. The 18-inch line was built to take care of the production which has been developed in the

Grant County portion of our acreage and, also, takes care of two gas purchase wells which are located in the extreme western edge of Haskell County.

The system is an entirely looped system, that is, it is possible for gas produced in the north part of the field to travel around by the way of Hugoton, or gas produced in the Stevens County area of the field to travel clear around, as was described.

Q. Does that constitute an additional guarantee of service in the event one of the lines goes out?

A. Yes, it does. It also has some impractical features from an operating standpoint.

Q. What are those?

A. In the winter time as the higher pressures are required to supply our market requirements at the proper [fol. 5725] intake pressures at Liberal, the pressure out on this small line is raised to the point where the gas will freeze. There is very little flow and in the winter time we often close one gate on that line which could be opened in case of line failure, but we govern the flow by closing a gate valve there.

. . . . . .

That is on the 10-inch line located in the northwestern part of Stevens County.

Q. Was the upper gathering line constructed at the same time the lower gathering line was constructed?

A. No, sir, the lower gathering line was constructed in the latter part of 1930 or the first part of 1931 and the 18-inch portion of the system was constructed in the latter part of 1937.

. . . . . .

Q. And was that the time that Panhandle Eastern opened up its production in the Grant County area?

A. Yes. We took no production from Grant County until the latter part of 1937.

. . . . . .

[fol. 5726] Q. Does Panhandle Eastern have any competitive production out of that area in Grant County?

A. Yes, there are three markets out of that area, namely, the Tri-County Gas Company and the Peerless Carbon Black Company and the United Carbon Company.

Q. What use do the carbon companies make of their gas?

A. Why, the carbon companies make what they term an extremely high grade of carbon black.

Q. For printers' ink and things of that kind? A. Yes.

Q. And is there another pipe-line company operating out of there?

A. Yes, that is the Tri-County and it produces gas that serves portions of the extreme eastern side of Colorado and some extreme western Kansas towns and, also, produces some gas for the Northern Natural Gas Company.

Q. Is it, so far as you know, affiliated in any way with any of the other gas companies?

A. No, sir, I do not know what the background of that company is.

Q. Now, what about the present situation from a gross-production standpoint as to acreage in the north of that lowered pressure area in Grant County?

A. That is yet to be determined. It is assumed that [fol. 5727] it will be, in general, the same as that which has been developed in Grant County to date, but the variation in the wells which have been drilled in Grant County to date indicates that there will be some very good spots and some very lean spots in that area.

Q. Is there any other pipe line operating in the area north of that which you have been describing, north of the lowered-pressure area in Grant County?

A. Yes. There is production in that area from some Tri-County wells and from some wells which are owned by the Northern Natural Gas Company.

Q. Now, with respect to the area in Stevens and Seward counties, which lies immediately east of the area from which Panhandle Eastern has taken the greater portion of its production, what is the production situation in that area?

A. You refer to the low-pressure area—

Q. (Interposing) Well, everything from the lowered pressure area in which Panhandle Eastern has produced gas, going easterly?

A. There has been only slight development in the area to the east. The discovery well of the entire field, not the Hugoton Area, was encountered on the Bole Farm in 1924, I believe.

Q. Where is that located on the map?

A. That is about four miles to the west of the Town of [fol. 5728] Liberal, Kansas.

Q. All right.

A. And between the eastern development of the Hugoton area and the development shown just west of Liberal there on Exhibit 26; where the lower pressure area appears there have been no wells drilled. There was a well drilled immediately north of Liberal here in Section 29, Township 33, Range 33, Seward County. That well is known as the Seeley wells and at the present time has an open flow which is below 750 thousand cubic feet per day. It has never been connected to any market.

Q. Would you consider such a well as that really a commercial well?

A. With acid treatment, I think it is quite possible that it can be made into a commercial well, as there are many wells in Grant County, in the portion of the field which has been developed in Grant County, that have had natural open flows that have been less than one million cubic feet per 24 hours.

Mr. Littman: How did they respond to the acid treatment?

The Witness: Very good.

Mr. Littman: What open flow was secured after the acid treatment?

The Witness: Well, when we speak of open flow on an acidized well, it is necessary to name the type of open flow method used in testing.

[fol. 5729] Mr. Littman: Well, I am referring to the same method by which you arrived at the one million figure that you just mentioned.

The Witness: By the same method the test of some of those wells will go up to 16 million [to] 17 million. In fact, we had one well which had a natural open flow of slightly

under one million cubic feet and when acidized it went to 28 million cubic feet per day.

Most of the wells in the Hugoton Field respond to acid treatment better than the wells in the Panhandle Field when the tests are made by the pitot tube method, but when those wells are back-pressured, they do not show any greater increase than the Panhandle wells.

In other words, a well will have a natural open flow of one or two million cubic feet and when acidized will go up to 20 million or more.

When tested by the back-pressure method, the open flow on those wells will usually be about 4 to 5 million greater than the natural. In other words, they fall into the 6 million or 7 million classification.

Mr. Littman: And then they are commerical wells?

The Witness: Oh, yes; yes, sir.

By Mr. Culton:

. . . . . .

[fol. 5730] Q. Now, you referred to the well on the Boles Farm down there by Liberal. What company has been taking gas from that well?

A. The Liberal Gas Company.

. . . . . .

Q. Then, there is an area north of the Boles well and, also, south of the Boles well several miles in extent, from which no production has been taken?

A. Yes, sir. The total development of the Kansas portion of the Hugoton Field is about 11 percent of the acres [fol. 5731] outlined on this map.

Q. Now, tell us the production situation with respect to the wells in Texas County, Oklahoma. What production has been taken from that area?

A. The total amount of production that has been taken from Texas County, Oklahoma, has been very light indeed. The principal markets for wells drilled in Texas County are the Cimarron Utilities Company which furnishes gas to some of the small towns in Oklahoma, the Guymon Gas Company and the Cabot Carbon Company.

Q. The Cabot production is used for what purpose?

A. For the manufacture of carbon black.

Q. Has the manufacture of carbon black proceeded in the Hugoton Field anything like the extent that it has proceeded in the Panhandle Field?

A. No, and I don't think that it ever will.

Q. Why not?

A. Because there is not enough gas there to supply the same quantity that is supplied in Texas without building very extensive gathering systems.

Q. In other words, the wells will not deliver anything like the same volumes of gas? A. No, sir.

. . . . . .

[fol. 5732] Q. Now, what other companies, if any, other than those small companies which are now producing gas from the Texas County, Oklahoma, area?

A. Yes, the Republic Natural Gas Company has, as I remember, 23 wells now connected in the northern portion of Texas County, Oklahoma, and that gas is sold to the Northern Natural Gas Company.

Q. The Northern Natural goes to Minneapolis and St. Paul? A. Yes, sir.

Q. And, also, serves other points in between?

A. That is right. The Omaha District of Nebraska, and that contract has clauses which concern the Omaha and vicinity market.

Q. Now, has the Republic acreage in Texas County, Oklahoma, been producing very long?

A. They have had some wells down there for, I believe, [fol. 5733] six or seven years. However, they have drilled some 20 wells down in that area during the past three years.

. . . . . .

Q. That area in Texas County, Oklahoma, about which you have been talking is really a portion of the same general area as the Stevens County area which you first discussed, is it not?

A. Yes. If we had no knowledge of a state line existing there, we would not know when we crossed from one State to the other.

[fol. 5734] Q. And that is just part of the same general pressure area and the same production area?

A. That is correct.

Q. Now, passing below that portion of the Texas County, Oklahoma, area, which is really a part of the Stevens County area, what has been the production situation to the south?

A. You refer to the central part of Texas County, Oklahoma?

Q. Central southern part.

A In the central part the withdrawal has been extremely light and the only reduction in pressure shown is that the decline has been below 430 and the pressures are still above 420.

Q. Where is that point located?

A. Referring to Exhibit 26, it crosses the "X" in Texas County, Oklahoma, which is located about four miles north of the Town of Guymon, Oklahoma.

. . . . . .

[fol. 5735] Q. That is the small, orange-colored portion?

A. Yes, the only portion of Hugoton Field outside of the extension of the Kansas development at the northern edge of Texas County, Oklahoma, that shows any pressure decline at this time.

Q. Is there a development in the southern part of Texas County, Oklahoma?

A. No extensive development. There have been some wells drilled and I don't have the locations. It is just a matter of a very few wells.

Q. What is the production situation with respect to the acreage of Hansford and Sherman counties, Texas, that is thought to be a part of the Hugoton Field?

A. There have been wells drilled in Hansford and Sherman counties which govern the outline of the dotted line shown on Exhibit 26. The best wells were drilled in Sherman County by the I. T. I. O. Company and Hagy, Harrington & Marsh, and they were wells of considerable size. As I remember they had natural open flows of some 40 million cubic feet for 24 hours.

. . . . . .

[fol. 5736] Trial Examiner: They were not used?

The Witness: They have never been connected to any market yet.

Trial Examiner: What happened to them?

The Witness: They are there, ready to be connected.

Trial Examiner: Simply closed off, finished but closed?

The Witness: Yes, sir, that is true.

* * * * * * * *

Mr. Littman: According to Dr. Bartle, the Hugoton Field, as outlined by him on Exhibit 26, designated by the area within the dotted lines covers an area of 2,540,000 acres.

[fol. 5737] Now, can you state how much of this territory is under lease by all companies at the present time?

The Witness: No, sir.

* * * * * * * *

The Witness: No, sir, because there is so much of that marginal acreage that is not leased and probably will never be leased that I could not say. I can say this, that I would estimate that 90 percent of the acreage lying within a distance of some two or three miles from the outer limits of development is now under lease; but bringing in the marginal acreage in the Hugoton Field, the same as any gas field of this type, there will be many thousands of acres of marginal acreage, I mean the acreage located near the extreme outer edge of the field, that will in all probability never be leased.

* * * * * * * *

[fol. 5738] Mr. Littman: Well, would you say that approximately a half of this amount of acreage embraced by the outline of the Hugoton Field shown in Exhibit 26 is under lease, roughly?

The Witness: Roughly, I would say yes.

Mr. Littman: And about a half, of course, is not under lease?

The Witness: That is correct. I am doubtful whether it will be leased until such time as development proves that there may be sweet spots or areas of better produc-

tivity lying closer to the boundary of the field shown on Exhibit 26.

Mr. Littman: Now, while we are on this subject, at this point, am I correct in understanding that Panhandle Eastern at the present time controls approximately 10 percent of the acreage embraced in Dr. Bartle's outline of the field, to-with, 245,282 acres?

The Witness: Yes, I would say that the Panhandle Eastern Pipe Line Company controls approximately 10 percent of the areas included in the outline of the field shown on Exhibit 26, if the calculations of 2½ million are correct.

. . . . . .

[fol. 5742] By Mr. Culton:

Q. I believe you have testified that the Cities Service Gas Company, or the Empire organization owns substantial reserves in the Hugoton Field which have not yet been developed at all. Where are those reserves located?

A. Well, they are located in Township 3, Range 13, portions of each Township mentioned; Township 3, Range [fol. 5743] 14, and Township 2, Range 13 and Township 2, Range 14 and take in portions, also, of Township 1, Range 13 and Township 1, Range 14, all in Texas County, Oklahoma. That is known as the Stonebreaker Ranch.

. . . . . .

Q. And in solid blocks, practically?

A. Practically in solid block, except for acreage held at the north edge. It is not adjacent to and contiguous with the Stonebreaker Ranch, but still it is checkerboarded in close to that general area.

Q. Do you know if the Cities Service, also, owns leases in the Texas portion of the field through the I. T. I. O.?

A. Well, I don't believe that the I. T. I. O. is in existence any more. I think it is just straight Cities Service Gas Company at this time. They do hold acreage in the Sherman County portion of the State of Texas portion of the Hugoton Field.

Q. And their former affiliate or subsidiary, the I. T. I. O., was the company which you testified had done some discovery drilling in that area?

A. Yes, that is correct.

Q. Now, is there any other company which holds substantial portions of undrilled acreage in the field?

A. Yes. The Northern Natural Gas Company has con-
[fol. 5744] siderable holdings.

. . . . . .

They have considerable acreage in the central part of Stevens County and the greater part of it being located up in the Grant County, central Grant and central Stevens counties.

Q. How about the Republic Natural Gas Company? Does it have a substantial amount of undrilled acreage?

A. Yes, the Republic Natural Gas Company, for the size market it has, carries more acreage by delay rentals than any company I have ever known.

Q. Where is its acreage located?

A. Its acreage is located in both Texas County, Oklahoma, Stevens County, Kansas, and some, I believe, is in the southern part of Grant County, Kansas.

Mr. Littman: Mr. Culton, from time to time the witness has referred to substantial acreage. Can he supply the figures for us?

By Mr. Culton:

. . . . . .

[fol. 5745] Q. Can you give us a rough estimate now, recognizing the fact that it would be only rough? For instance, the acreage held by Republic?

A. Republic at the present time holds approximately 220,000 acres located in the Tri-State field. That is subject to check, because the acreage picture changes so fast. They have acquired a great deal of acreage during the past year. They have taken over the acreage which was formerly held by Hagy, Harrington & Marsh in the Kansas portion of the Tri-State Hugoton Field and have, also, acquired considerable quantities of acreage in Texas County, Oklahoma, both by leasing scattered blocks and by exchanging acreage with other companies.

Q. Now, Hagy, Harrington & Marsh sold all of their Kansas acreage, you say, to Phillips. Do you know how much was left for them in Texas County, Oklahoma, and

Sherman and Hansford counties in Texas, including the Bivins Cold Water Ranch?

A. Before they got the Bivins Cold Water Ranch, as I remember, they had 54,000 acres and the ranch in total is some 40,000 to 45,000 acres.

Mr. Littman: What is the total of that?

The Witness: 90,000 approximately.

By Mr. Culton:

Q. Can you give us the approximation of the Northern [fol. 5746] Natural acreage?

A. No, because their acreage picture changed just during the past few months and I don't remember what it is, but it is in excess, I am quite sure, of 100,000 acres.

Q. And the Cities Service?

A. I don't know what the acreage in the Stonebreaker Ranch is, but it can't help but be around 100,000 acres.

Q. Is there any other company with very large acreage except those that we have mentioned?

A. Well, the Peerless Carbon Company have a great deal of scattered acreage and considerable quantities of acreage are held by the Columbian Fuel Corporation. When I say, "considerable", I mean around 15,000 acres.

I would say there is considerable acreage.

Mr. Littman: There isn't any question about the fact that Panhandle Eastern is, by far, the largest individual holder of acreage in the Hugoton Field?

The Witness: I believe that is right. I had a figure in my mind the other night that Republic had acquired a greater number of acres than we held, but since I have been thinking it over, I am qute sure that I was wrong and I was thinking on the basis of the number of acres in proportion to the market rather than in total.

By Mr. Culton:

Q. The Republic is next to the Panhandle Eastern in [fol. 5747] acreage?

A. Yes, I am quite sure it is.

Trial Examiner: So far as Panhandle is concerned, that statement refers to acreage under purchase contracts, or only to royalty acreage?

The Witness: That includes both the acreage held by development and delay rentals.

By Mr. Culton:

Q. In other words, in addition to the acreage owned by Panhandle Eastern in that field, Panhandle Eastern is connected to a substantial gas purchase?

A. Yes. We buy gas from more wells in the Hugoton Field than any other company except the Northern Natural Gas Company, which buys from Republic and the Kuhn Brothers, also, the Derby Trees Oil Company and are interconnected with wells owned by the Tri-County Gas Company, these wells being able to produce into the system of the Tri-County Gas Company or the Northern Natural Gas Company.

Q. From the standpoint of Panhandle Eastern Pipe Line Company, what is the necessity for owning this undrilled acreage?

A. As a matter of reserve and having a place to carry on future development that will enable the company to supply its market requirements.

Q. Being in control of the acreage, does that permit [fol. 5748] you more safety to plan in the future with respect to your gathering lines on a general program of development that if you just had to connect to such operators as desired to sell?

A. Yes. It does help us with our development planning, but at the same time, this same thing applies in the Hugoton Field, maybe not to as great a degree, but it does apply, that withdrawal is the index to the total recovery from either of these fields. If we are subjected to a heavy rate of withdrawal which is contiguous or adjoining our acreage, why, then the amount of gas which we will recover will either be decreased or we will have to take it at a greater rate.

Q. Owning and controlling the acreage yourself permits you to more economically operate your gathering lines and determine pressures at which they will be operated, and things of that kind?

A. When you say "owning acreage", you mean that the acreage is only held by royalty?

Q. That is right.

A. As we own no land in fee at all.

Q. That is right. I mean, you own and control your leases. A. Yes.

Q. Giving you the right to operate your leases?

A. That is right. It does give us a much better opportunity to plan from an operating standpoint.

[fol. 5749] Q. In other words, it gives greater elasticity to the system so that you can control the expansion at such time as you think it most economical to spend?

A. Yes, that is right.

. . . . . .

[fol. 5752] Q. The acreage which Panhandle Eastern now holds in that field is held largely as a matter of protection for the future, is it not, so as to give adequate reserves in the future?

A. You refer to the Hugoton?

Q. Yes.

A. Yes, that is correct. We have always thought of the Hugoton Field as the source of our future reserves.

Q. It furnishes insurance to Panhandle Eastern and its customers and the people served by it of a supply of gas as long as that field reasonably lasts?

A. That is correct.

Q. Is Panhandle Eastern's acreage confined to one particular portion of that field, or is it pretty well dis-

[fol. 5753] tributed over the entire field?

A. It is very well distributed over the entire central portion of the field.

. . . . . .

Q. And a comparison of the acreage picture on Exhibit 20 with the general field outline on Exhibit 26 will show that Panhandle's acreage is well distributed over the entire field so as to take advantage of any situations which may arise in [difference] portions of the field?

A. That is correct and, also, it would, in my opinion, not be good policy to put all your eggs in one basket, take all the acres in one portion of the field when the

percent of the field that has been developed is as low as it is at the present time.

* * * * * * * * * *

[fol. 5754] By Mr. Culton:

Q. Mr. Hinton, at the recess, you reminded me that the Panhandle Eastern had acquired substantial acreage in the last few months. A. Yes.

Q. About how much acreage has been recently acquired in the Hugoton Field?

A. Yesterday, in answer to Mr. Lee's inquiry, I read into the record the amount of acreage which was now held by Panhandle Eastern as of November 30, 1941. In last night's mail, I got my acreage report for the next month and, if you would like, I can read that total in, as of December 31, 1941.

Q. All right.

A. 256,962.69 acres. That shows a total increase of somewhere around 29,000 acres, and I cannot be sure because I do not know just exactly what it was as of June 30, but, in round numbers, we would say 30,000 acres.

The greater amount of the acreage which has been leased during the period mentioned is located along the north side of our present development in Grant County, Kansas; also, some to the west and to the south of our present pipe line, which extends in a diagonal line across the Grant County map, as shown on Exhibit 20.

We have also secured additional acreage in a portion of Texas County, Oklahoma, which is principally located in [fol. 5755] Township 5, Range 13; Township 5, Range 14, and Township 4, Range 14, all in Texas County, Oklahoma.

Q. Does that help to block in the company's acreage in those two areas?

A. Yes, it does. It gives us a very nice area to develop in Texas County, Oklahoma, and that area is in very nice relationship, as to location, to our proposed gathering system and the acreage which has been secured in Grant County, Kansas, is located so that it may be connected to our present system without incurring great costs for additional pipe lines.

Q. In your original testimony, you assumed that Panhandle Eastern would, so long as it is economically ad-

visable, apportion its takes between the Panhandle Field and the Hugoton Field on approximately the present basis. What is that present basis of apportionment?

A. It is, in percent, around 27-½ percent from the Hugoton Field and about 72-½ percent from the Panhandle Field of Texas.

Q. What principles have guided you in selecting that present apportionment?

A. The total rate of withdrawal from each field and the protection of reserve to the greatest possible extent in each field.

Q. What do you mean by "protection of reserves"?

A. By that, I mean that our rate of withdrawal from [fol. 5756] each field is governed by the total withdrawal from each field and, more particularly, around the areas in which we operate.

Q. In other words, you have reached the conclusion that as long as the present production from the two fields is approximately what it now is, that you will be able to protect your reserves in both fields from extraordinary drainage by apportioning on that basis?

A. That is correct, and it must be given much consideration in the problem of obtaining the greatest possible amounts of gas from our reserves, especially in this type of field.

Q. Which field do you refer to, when you say, "this type of field", both?

A. Both fields, but more particularly in the Texas fields, where the rate of flow through the formation is greater.

Q. You also stated in your original testimony that you assumed that the Panhandle Eastern would continue to apportion its production between its own leaseholds and its gas purchase contract acreage on the basis now existing? A. That is correct.

Q. What is that basis?

A. That concerns the method of proration used by this company in each field.

Q. And what elements are taken into consideration, in that proration?

[fol. 5757] A. The proration formula used in the allocation allowables to wells located in the Panhandle Field is 50 percent of the total production divided on the basis

of the total acreage and 50 percent of the total production divided on the basis of total open flow and the percent which each well participates in the total development, governs the percent participation which that well will have in the total withdrawal by this company.

Q. What is Panhandle Eastern's practice with respect to the acreage which will be considered in connection with any well from which it takes gas? Do you have a maximum acreage?

A. Yes, there is a maximum acreage unit of 640 acres per well.

If you meant for me to also describe the method in the Hugoton Field, I did not complete that.

Q. Yes.

A. In the Hugoton Field, the formula used by Panhandle Eastern Pipe Line Company is that of determining allowables by dividing the total market into two parts, one part being 75 percent, which part is divided on the basis of acreage times wellhead pressure; the other 25 percent is divided on the basis of open flow and, of course, the same applies as in the Texas Field, that is, that the percent that each well participates in the total development governs the percent which that well will participate in the total market.

[fol. 5758] Q. How long has Panhandle Eastern adopted the practice of using 640 acres as a drilling unit?

A. We have never used a unit greater than 640 acres in proration during the entire history of the company.

Q. I think you said something about your plan, at least for sometime in the future to meet peak requirements from the Hugoton Field. Just what did you mean by that?

A. If we would design our lines so that we would meet our peak requirements by applying the percent of division between fields, it would mean that we would have to make many thousands of dollars of capital expenditure for increasing the capacity from Texas.

Therefore, the load has to be handled in such a manner that the monthly divisions have the tendency of curtailing Hugoton production during the summer months when the load demand is light and then taking far more than the 27-1/2 percent during the four winter months.

Q. In other words, what you have in mind, as nearly as possible, is keeping the Panhandle area on a fairly constant load factor?

A. Yes, that is right. In other words, during the summer months, the percent of the total market from the Panhandle Field exceeds the percent which we set for that field of 72-½ percent.

In fact, it will run up into the high eighty percents [fol. 5759] during the low-pull months in order to meet the percentages which I believe will be most advantageous for the company acreage.

Q. You have testified that commencing in 1942, you expect to have a substantial program of expansion of your facilities in the Hugoton Field by reason of operations in Texas County, Oklahoma.

Will those operations in that field result in any immediate change in the volumes of gas taken from the Panhandle Field?

A. No, sir, but they will result in some curtailment of take from the developed portion in the Kansas Field.

Q. I believe you stated that, from the standpoint of physical operation, you could, for a while, continue to take the necessary volumes of gas from the existing producing properties in the Hugoton Field?

A. That is correct. We have been forced into the development program which we expect to carry out during 1942.

Q. That is due to the circumstance that you had some expiring leases in Texas County, Oklahoma, which were top-leased by other operators?

A. Yes, and it so happens that those leases are located in what should be a very nice part of the Texas County portion of the Hugoton Field.

Q. Would you be able to protect yourself merely by the [fol. 5760] drilling of wells on those leases which are expiring?

. . . . . .

A. The lease form requires that a developed lease be producing gas in commercial quantities.

Q. And the mere discovery of gas is not sufficient to hold your lease?

A. Just the drilling-in of a well does not completely develop a lease.

Q. You have already, I believe, started, and are down about the producing horizon, the first well in that field to be drilled under that plan? A. Yes.

Q. And will you point out on Exhibit 44 the location of that well?

A. That well is located in the—it is shown here to be located in the west half of Section 25, Township 3, Range 15, but we have shifted the location of that well over to the center of the north half of that section so that we will have another location on that lease which consists of 800 acres that will be a greater distance from the well than it would be if we would have gone ahead and drilled in the center of the west half of that section.

* * * * * * * *

[fol. 5761] A. Yes.

Q. Now, do you have any other leases in that field which have been top-leased and which would have to be drilled pretty soon if they were held?

A. Yes. Of the wells shown in brown which indicate the development which will be carried on during the year 1942, there are 20 wells shown and of this 20, 14 have been top-leased.

Q. Now, you have stated that it would not be enough to hold the leases merely to drill the wells. How far are those wells located from the present trunk line, roughly speaking?

A. About 12 to 15 miles average, I would say.

Q. Is there any existing gathering line which could serve those wells?

A. No, there are no existing gathering lines.

Q. In the construction of the gathering line system shown on Exhibit 44 in brown, have you limited that gathering line to a size sufficient to serve the wells which you expect to drill during 1942? A. No, we have not.

Q. Why is that true?

A. Because we are looking at the over-all cost of a development required to carry the amount of gas which we anticipate taking from this portion of the Hugoton Field, [fol. 5762] and if we would build a line that would take care of the production of the wells drilled in 1942, it would

mean that that line would have to be looped or the capacity increased by building an additional line in the next year or two, and it is much cheaper to provide for future capacity by the looping of one line of larger diameter than it is to build several lines of smaller diameter pipe.

Q. Therefore, in your construction program, you have taken into consideration the over-all economic picture of the company now and in the future, is that correct?

A. That is correct. However, the present 22-inch line will probably not be adequate to carry the total amounts of gas which we will have to take from this field in future years.

Q. That is, after the 1946 period?

A. Yes. I think it will be quite a while before we have to loop this line, but then the 16-inch line which carried the gas from the Hugoton Field at the time it was built was of large enough diameter to carry the gas to fulfill market requirements.

We have now built the 18-inch line, known as the Grant County, 18-inch Line, and sometime after 1946, and probably not too long after that, it is going to be necessary to further increase the capacity of the pipe line from Hugoton Field.

Q. After the Texas County, Oklahoma, gathering line is completed, then you will have three major gathering line [fol. 5763] systems in the Hugoton Field. Is that correct?

A. That is correct.

Q. Two in Kansas and one in Oklahoma?

A. Yes, sir, that is correct.

Q. You will still have none in Texas?

A. Maybe for clarification, we would say, instead of two major gathering systems, we would say that we have two major trunk lines connecting to our gathering system in that field.

Q. That is right, but you have one gathering line serving the Texas County, Oklahoma, area, another serving the Stevens County, Kansas, and another the Grant County, Kansas, with a connection from the one serving the Grant County, Kansas, to the one serving the one serving the Stevens County, Kansas?

A. Yes, that is correct.

Q. You do not, during this five-year period, expect to develop any of the acreage held in Hansford County, Hansford or Sherman counties?

A. No, that acreage is held for the purpose of trying to make up what we will not be able to produce from the Panhandle Field, and thus longer utilize the facilities which will be installed and are now installed at the Hansford compressor station.

Q. In other words, after the time arrives when it will [fol. 5764] become necessary for Panhandle Eastern to cease producing gas in the Panhandle Field, you expect it to develop its properties in Hansford and Sherman counties, Texas, so as to use as much of the trunk gathering line which now extends down into the Panhandle Field as is possible?

A. That is correct, and also the compressor station facilities.

Q. At Hansford? A. At Hansford.

Q. In other words, you assume that you will probably have a gathering line running from Sherman and Hansford counties into the Hansford station?

A. Yes. I have projected that and tried to relate it into the problem as a whole on a ten-year plan, and that line shows it is to be built in that ten-year period.

Q. You have, I believe, referred to the circumstance that efforts are now being made, and have been made for some time, to enforce statutory proration in Kansas?

A. That is right.

Q. And have stated that if that movement succeeds, there is a probability that it will increase Panhandle Eastern's capital expenditures over those shown in your exhibit?

A. If the same type of order is placed on the field or, I would say, the same order that is now, I believe your attorneys call it "stayed", then I think that it will be nec- [fol. 5765] essary to make additional capital expenditures in that field over those which we show, and that the cost of gas may also be increased by the fact that the unconnected wells may be connected to our line by an order of law.

Q. Is that due to the circumstance that you will probably be permitted to produce less gas from individual wells than you can produce now, thus requiring you to

take your entire requirements from a greater number of wells?

A. Well, that is largely dependent, as the system exists today, upon the Republic Natural Gas Company and the State of Oklahoma.

Q. Will you explain that?

A. Republic Natural Gas Company has been facing this order the same as all companies operating in the Kansas portion of the Hugoton Field, and it looked to them as though they might be forced to operate under such an order.

In order to meet their market requirements and to be able to supply their contractual amount for the Northern Natural Gas Company, it would have been necessary for them to have drilled a number of wells in the Hugoton Field in the neighborhood of 50 additional wells but, in place of doing that, they merely went across the State line into Oklahoma and drilled about 20 wells, from which they are able to take a great amount of gas.

If the State of Oklahoma would come out with a pro- [fol. 5766] ration order, why, that would, maybe help to protect us somewhat, but if it does not, Republic Natural [Gas] Company, by drilling just a few additional wells, can take the major part of their entire demand from the State of Oklahoma and cut down on the amounts which they will take from the Kansas wells, and that will set the pattern for Panhandle Eastern and it will mean—

Q. (Interposing) By "setting the pattern", you mean the amount of production per well?

A. I mean the amount of gas that can be produced for each M.c.f. open flow and each acre-pound which, when developed, will be necessarily the same as that taken by the Republic Natural Gas Company or by any market that sets the pattern, and by setting the pattern, I mean the company that has the lowest ratio between their market demand and development.

Q. And in the event that caused the pattern to change and lowered the amount of production per well, how would you obtain your additional production?

A. By drilling additional wells or by moving to Oklahoma unless we had a proration order in Oklahoma. If

we had no order in Oklahoma, it would mean that we would certainly develop in that State rather than to drill wells where the amounts of gas which would be taken would be lower than would be good for economical operation.

[fol. 5767] Q. Mr. Hinton, in the event your present plan is fully carried out, you will drill these wells you have referred to in Texas County, Oklahoma, and are permitted to prorate among all your wells in the Hugoton Field on your present basis, would your production have a tendency to cause the pressures of the field to go down more uniformly than if all of the production were being taken from one individual area?

A. No. As long as we have the two-state situation there any proration order.

Q. (Interposing) I mean, disregarding proration, if you are permitted to go ahead and use your own judgment of prorating among the wells, would the pressure go down more uniformly over the field, as a whole, than if you were taking your production from, say, Stevens County?

A. It would certainly be more uniform. Anytime the rate of production is properly distributed, the decline in pressure will be more uniform over the field.

Q. What effect does decline in pressure have on the deliverability of gas from wells and the ability to carry uniform pressures in gathering lines, and so forth?

A. It creates a much better operating condition, because a common pressure will be experienced at almost all wells, and by lowering the working pressure down to a certain point, it would still mean that all wells will be [fol. 5768] able to produce gas into the system, whereas if the wellhead pressures are not uniform, such as those we have in the Panhandle Field in Texas at this time, why it is then necessary to revise and revamp the gathering system by the addition of horsepower in the low-pressure areas.

Q. I believe that you have testified that you have in mind taking a maximum of approximately 60 billion per [fol. 5769] year from the Texas Field. Is that correct, 60 billion or 61 billion, something like that?

A. Yes, as long as I have estimated that we would be able to take that amount.

Q. And I think in response to questions asked by Commission counsel, you stated that, of course, by addition of capital expenditures, you could take, for a while, greater amounts than that from the Panhandle Field?

A. That is right.

Q. Why is it not economical, in your judgment, to do that?

A. Because, if we spent all of our money for capital expenditures in Texas, it would mean that at the time when we would move from Texas to the Hugoton Field as a source of production, that our over-all money picture of capital expenditures would be much greater than it would be if we carry out the development plan which we have outlined.

* * * * * * * *

[fol. 5777] Mr. Littman: (Interposing) May I interrupt to inquire whether you mean by that if the capital expenditures, which are shown in Exhibit 42 for the years through 1946, are made to some extent in advance and in anticipation of future needs, is that what you mean?

The Witness: Yes, and at the same time to cut down on the amounts that will be required in years after that period.

By Mr. Culton:

Q. In other words, in determining your expenditures during the period 1941 to 1946, you had in mind taking care of some of the situations which would develop during the years 1946 to 1951?

A. Yes, it would not be wise planning not to do so.

Q. And in some instances, possibly later than that?

A. Yes, that is correct.

Q. Do you think that all of these expenditures which you have shown in Exhibit 43, Schedule 1, being a list of additional capital expenditures required to produce and [fol. 5778] gather basic load during the years 1941 to 1946, will be required?

A. Yes, unless, of course, we are forced to cut back some of our load due to the fact that we will not be able to obtain the necessary steel to make these additions.

Q. Aside from the possibility of getting the steel, and looking at it from the standpoint of the company's economics, do you think it is advisable for all those expenditures to be made, for the most economic production of gas?

A. Yes, and I might say that the major items are now on order.

Q. That is to obtain the basic load. Do you think that these items separately set out in Exhibit 42 under the basic load are priced at reasonable prices for such labor and materials?

A. Well, reasonable, but I think perhaps that we should not mention the uncertainty of labor prices, because they are not reflected in those prices, and what now appears to be a reasonable price may become an unreasonable price with the rising conditions.

Q. But the prices, you think, are fair and reasonable as of the time the exhibit was prepared?

A. Yes, sir.

Q. But you refer to the present reasonableness of those prices. Do you mean there will be increases of those [fol. 5779] prices or decreases of those prices?

A. We know prices are increasing on practically everything at this time, and I think our last pipe prices show that carload lots of pipe are increasing on a tonnage basis, and we did not use carload lots of pipe in the pipe to be used for the major portion of the gathering system.

Q. Do you think that the items shown in Schedule 2 of Exhibit 43, being additional capital expenditures required to produce and gather anticipated increased loads, will be reasonably required in order economically to handle the increased loads under Mr. Morton's estimate?

A. Yes, I think they are quite reasonable.

Q. Do you think that the prices shown for those items in Exhibit 42 represent fair and reasonable prices for those items as of the date of that exhibit was prepared?

A. I think the prices used are as nearly correct as it would be possible to place a price upon that type of work and equipment.

Mr. Littman: As of what date?

The Witness: As of June 30.

Mr. Littman: 1941?

The Witness: 1941.

By Mr. Culton:

Q. And if you were revaluing those various items at this time, or determining the present cost, would the cost be higher or lower than the cost shown at the present [fol. 5780] time?

. . . . . .

Trial Examiner: I think the record at the present moment is the witness has given no effect to the price increases or the causes for the price increases since the computation was made as of June 30, 1941.

Mr. Culton: The statement of the Examiner is correct, is it, Mr. Hinton?

The Witness: That is correct, or that is what I attempted to convey, at least.

. . . . . .

[fol. 5782] Q. Mr. Hinton, in your original testimony on Page 33 of Exhibit 42, you made this statement:

"Panhandle Eastern will, in the future, be required to increase its operation and maintenance expenses, even to produce the same volumes of gas which [which] it now produces."

On Page 729 of the record, in response to a suggestion from the Examiner that it would be appropriate for me to explain why we were offering evidence as to the cost of future capital expenditures during the next five-year [fol. 5783] period, I made this statement:

"Another circumstance which makes this evidence very pertinent is that as the years go by the evidence will show the over-all unit cost of producing gas is increased. It is increased because of the necessary carrying charges on the additional capital expenditures which will be required and increased by the necessary amortization of those capital expenditures and the depreciation of the items, and increased by the additional operating expenses which would be necessitated by reason of the increased expenditures."

In your Schedules presented in connection with Exhibit 42, that is, Schedules 3 and 4, in which you estimate operation and maintenance expense, both on the basic load and on the anticipated load, did you include anything as representing depreciation for any of the company's property?

A. No, sir, depreciation was not included. Schedules 3 and 4 refer only to operating and maintenance costs.

Q. By that you mean actual out-of-pocket money?

A. Yes, out-of-pocket money with the exception of the power item which has been brought up, which is an accounting problem.

Q. Yes. Then your schedules do not reflect anything for amortization? A. They do not.

Q. Nor do they reflect anything for interest incurred [fol. 5784] or returned on the investment?

A. No, sir.

Q. Do you purport to know what the appropriate amortization figures would be?

A. Not at this time, no, sir.

Q. Or depreciation? A. I do not.

Q. Or depletion of the reserves? You have made no computation in this exhibit for those items at all?

A. No, sir. I have given it a lot of thought but have not arrived at any figure to use for the depletion of reserves.

Q. Now, you have explained heretofore that even to transport the same volumes of gas as pressures in the field become lowered there will be additional compressor expense, I believe.

A. Yes, sir, there will be.

Q. And you have stated that you recognize that in so far as the actual out of pocket cost for gas used as fuel is concerned, there would be no appropriate charge for fuel in connection with the compressor station.

A. Yes, there would be an appropriate charge; but what that amount would be would have to be determined. The 15 cent per M. c. f. figure which was used is an arbitrary figure and there would be, naturally, the cost of the royalty [fol. 5785] on the gas and the cost paid to the vendors of the gas which would be a natural out-of-pocket cash item along with the operating expense required to transport the gas from the wellhead to the intake side of the compressor station.

Q. But, if these items are all included as expenditures and there is no charge against the company by way of a set charge on the other side of the ledger, then, it would not be appropriate to consider the 15 cents as an expense charge.

A. That would have to be determined. Whether 15 cents would, I don't know.

Q. Whatever the appropriate charge—

A. (Interposing) Whatever the appropriate charge might be.

Q. Now, in the operation of the compressor stations you state that you have additional gas required and, also, have some additional labor required.

A. That is correct.

Q. And that additional labor, both for maintenance and operations, is reflected in your schedules presented in connection with Exhibit 43? A. Yes, sir.

Q. Why is it that, as your compressors get old, the maintenance cost increases?

A. It might be compared to the cost of the operation [fol. 5786] of the family car. As the car becomes older it costs more to run that car the same number of miles.

Q. Does that same situation apply with respect to all of the other expense items in connection with production of gas, transportation of gas?

A. Yes, any of the—

Q. (Interposing) Any of the maintenance items?

A. Any of the physical plant is subject to a certain amount of depreciation year by year.

Q. I notice that in the year 1940—do you have your exhibit before you—Line 19, there is a very substantial decrease in 1941 over the 1940 cost for maintenance of the production system.

Q. You are referring to Page 1 of Schedule 3?

Q. That is right. A. Yes, there is.

Q. Explain what principle represents that difference between 11,000 in 1940 and only 7,990 in 1941.

A. The difference between the $11,821 for 1940 and the $7,990 in 1941 is largely accounted for by the clean-out work which was required on the Nield 1-18 well and that

operation was rather fully described in yesterday's testimony.

Q. Have you made allowance for a similar expense in the future years under either the basic load or the antici- [fol. 5787] pated load?

A. No, sir, because one never knows when that condition is going to occur and it is, therefore, impossible to set out a large amount of money in the budget for that purpose.

Q. Do you anticipate that some of your wells in the future will give you water trouble?

A. Oh, without any doubt that will happen to us. For instance, in 1940 our Gregory 18 well had this happen, the production string of casing parted down a distance from the top of the ground. Of course, that allowed the surface water to come in and the formation around the well was completely flooded.

It was necessary to run a new string of pipe into that well.

Mr. Littman: Pardon me, Mr. Culton. I would like to have the witness state, if he knows, the amount of money included in the year 1940 figure for production maintenance in Line 19 of Page 1 of Schedule 3 for the cleaning out of wells.

The Witness: As I remember that amount, Mr. Littman, it was approximately $6,000. The reason it sort of stayed in my mind is that I think that we estimated that that operation would cost $4,000 and it overran by that amount.

Mr. Littman: Have you included any sum in the year 1941 for cleaning out of wells? I refer to the $7,990 figure [fol. 5788] in Column "C".

The Witness: No, that figure is based on the first six months' actual cost and we did not clean out but one well after that time. That amount—I just can't recall what it was—was under $1,000.

Mr. Littman: Do you have amounts included in that line for the subsequent years to cover cleaning of wells?

The Witness: Yes, normal cleaning operations.

By Mr. Culton:

Q. What you had reference to was unusual conditions?

A. That is correct. Where, if I may refer to it again, the tools are lost and it is necessary to spend several additional days in trying to recover them.

We think of a normal cleaning-out operation as requiring about seven days besides the moving in and tearing down time.

Q. What has been the nature of your allowance in the subsequent years, 1942 to 1946, for clean-out expenses?

A. I don't remember just how many wells we estimated that we would clean out, but I can tell you this, we estimated that two wells would be cleaned out during the year 1942.

Those wells are in the 1942 budget at this time.

Q. Do you know what the wells are that you expect to clean out at this time?

Q. One of the wells is the Zofness No. 255 and the [fol. 5789] other well is—I just can't remember without going back.

Q. At any rate, you have a definite well in mind?

A. Yes, and a definite well is shown on the budget for our actual operating and maintenance budget for this year.

Q. Now, is that on the normal clean-out job that you have in mind for it?

A. Yes, sir.

Q. All right.

A. For the year 1943 we estimate that there will be three; there will be four in 1944; there will be five in 1945 and six in 1946 that are included in this schedule.

Q. And you have allowed only the usual and ordinary clean-out expense for those wells?

A. Yes, that is right.

Q. Have you, as yet, had any experience with wells salting up?

A. Yes, we have had, some slight experience.

Q. Explain just what is meant by the "well salting up."

A. By the term "well salting up or off", it means that salt in the formation begins to clog the permeability channels.

Q. With what effect?

A. With the forming of a restriction in the formation which will not allow gas to pass through the formation. In

[fol. 5790] other words, it merely blocks off the production from the well bore.

Q. Does it sometimes result in a restriction in the well bore, itself?

A. Yes, it does.

Q. And it sometimes results in restrictions out away from the well bore. Is that correct?

A. Yes. Sometimes the bridge is formed in the well bore, and I believe, that the type of salt that forms the bridge in the well bore is the easiest type to be dealt with because it still shows that there is sufficient permeability left to enable the salt to travel through the formation, but when that bridging starts back in the formation from the well bore it is a very difficult problem.

Q. What method is used for eliminating that bridge when a bridge of salt forms in the well bore?

A. If the bridge is a partial bridge, it can sometimes be removed by pumping water down on top of it and then opening the well to atmosphere.

Q. By that you mean blowing the well?

A. Yes, sir, sometimes it is necessary to run a string of tools in the hole to knock the bridge out.

Q. Is that a more expensive proposition?

A. Yes, that is a more expensive proposition.

We have been fortunate enough to be able to bring the [fol. 5791] wells back, where salting has occurred, by the use of just plain water.

Q. And what is the situation if the salt works into the formation back away from the well bore where the salt is deposited and clogs the channel?

A. Unless it is taken care of promptly, it will usually result in the loss of the well, because as the salt starts to form in the permeability channels away from the well bore it gathers the salt which comes in back of it and forms a very tight bridge.

Q. Have any of the other gas companies producing in that area had greater salt difficulties, so far, than Panhandle Eastern has had?

A. Yes, especially those companies which operate to the east of our general area.

Q. In the Panhandle Field?

A. In the Panhandle Field.

Q. What has been the situation there?

A. Well, Texoma has had to plug several of their wells. By "several" I mean seven or eight. They have lost those wells entirely.

* * * * * * * * *

[fol. 5792] Mr. Littman: Were those salted wells located in the east Panhandle Field?

The Witness: Yes, in the LeFors area.

Mr. Littman: How many miles is that from your production?

The Witness: I would say between 25 and 30 miles.

By Mr. Culton:

Q. The pressures over there are lower than they have now reached in your area?

A. Yes, that is true and that is where the real salt danger comes, especially in an area like our Group Area "D" where the water is showing now and it is necessary to have a certain amount of water to dissolve the salt in the formation to carry it into the well bore.

If we encounter serious trouble in the Panhandle Field, I believe it will be in our Group Area "D", although the three wells that have shown the greatest amount of salt are the State Permit well, 1-106, the Rockwell 1-102 and the Sneed 1-23.

Q. Where are they located?

A. Two of them are located in—

[fol. 5793] Q. (Interposing) I don't believe the map is there. Which group area?

A. Two in "B" and one in "F". The wells were checked for salting again late this fall.

Q. That is the wells you have just referred to?

A. Yes, the Sneed 1-23 was not checked for other than a water sample, but the State Permit 1-106 and Rockwell 1-102 were checked for salt by placing a critical flow prover on the well and allowing it to flow and then the amount of salt that was caught on the prover was noted.

I was happy to find that the condition was not as bad as it was two years ago on those wells.

Q. In other words, so far you have been able to control the salt situation all right on the Panhandle Eastern wells?

A. Yes. In the Hugoton Field we have had salting trouble on two wells and those are the ones that were brought back by the injection of just clear water.

Q. And where are those wells located?

A. One is the Light well located—

Q. (Interposing) Can you point out on the pressure map approximately where it is?

A. It is in Section 23, Township 33, Range 39.

Q. It is right below the letter "S" of the word "Stevens", is it, a little to the left?

[fol. 5794] A. It doesn't show on there. We have two light wells. Maybe I better check the location.

Q. Are they close together?

A. Yes.

Q. Just the general area was what I had in mind.

A. It was the area to the west, I might say northwest, of Stevens County. The other well is the Greening well which is located in Section 6, Township 35, Range 39, Morton County, Kansas.

Q. Are those wells in high pressure areas?

A. Yes, they are in what would be termed high pressure areas.

Q. To what extent had the salt affected those wells when you went to work on them?

A. The light well had an original natural open flow of approximately 8 million cubic feet for 24 hours and this had fallen off to an amount which, as I recall it, was slightly below 2 million cubic feet for 24 hours.

After the clear water was pumped into the well and left to stand for several hours and then blown back out, the well again came back to approximately its natural open flow.

Q. How about the other well?

A. The other well was a well which was cleaned out by putting a rig over the well and it was plugged back at the time the clean-out was made and acidized, so we don't [fol. 5795] know exactly what it might have done to come back to its natural open flow, but it did show a nice increase in open flow by the use of acid.

Q. Do you anticipate greater trouble or less trouble from the standpoint of salt difficulties as the pressures become lower in the Panhandle Field?

A. Well, naturally, the difficulties will increase, if they are going to occur, as the pressures become lower.

Q. Have you made any allowance for that possibility?

A. No, sir, I don't think one could reasonably make any set sum allowance for that possibility?

Q. Therefore, in your estimate of operation and maintenance cost, both on the basic load and on the anticipated load, that element has not been taken into consideration?

A. No, sir, because I don't believe that we will have any great trouble until after the year 1946.

Q. It is in subsequent years where you think the greatest difficulty will be?

A. That is right.

Q. Is there any way by which you can tell when that would be or what the cost of it would amount to?

A. No, sir.

* * * * * * * *

[fol. 5812] Q. You stated, I believe, in response to one of Mr. Littman's questions or maybe some other counsel's, that it was possible, physically, to so operate your system as to raise or lower the working pressures required in the [fol. 5813] gathering lines?

A. Yes, that is correct, it is possible.

Q. How is that done, if you want to lower the working pressure?

A. To take more gas away at the other end of the pipeline.

Q. And what does that require?

A. That requires the delivery rate to be increased.

Q. And how is that increased?

A. That is increased by the application of horsepower to the flow.

Q. In other words, you have to build more compressors, is that it?

A. Yes, sir.

Mr. Littman: Couldn't you loop lines, also, and get a similar result?

The Witness: Yes, that is true, Mr. Littman. Much can be accomplished by the looping of pipe line systems and if you will note the expenditures which are shown in Exhibit 42, it does anticipate the looping of a considerable portion of our system as well as the installation of additional horsepower and, again, that is where the economics of development come in,—which is cheaper, horsepower or the looping of lines.

Mr. Littman: That is what prompted my question.

[fol. 5814] The Witness: Yes, sir.

By Mr. Culton:

Q. Then, irrespective of how it is done, the expenditure of additional money for capital investment is required?

A. That is right.

Q. And the economics of the situation will have to be carefully studied to determine whether or not it is economically advisable to operate so as to lower the working pressures at any given time?

A. Yes, that is right.

. . . . . .

[fol. 5843] C. H. Hinton a witness, having been previously duly sworn, resumed the stand and testified further as follows:

[fol. 5844] By Mr. Culton:

Q. Mr. Hinton, several days ago you were requested to prepare certain schedules with respect to cost of gas, giving no consideration to the carrying charges on the reserves, on the existing facilities or on the facilities to be hereafter added, and giving no consideration to amortization, depletion, depreciation and replacements with respect to those properties.

Have you now caused that study to be made?

A. Yes, and the results of this study are reflected in Exhibits 142 and 143.

Q. You have been on the stand continuously, but you did give instructions to a representative of the Panhandle Eastern Pipe Line Company, showing him what figures to use in making these studies, is that correct?

A. Yes, that is correct.

Q. And have you now checked over these results, however, to see whether or not he has followed your instructions?

[fol. 5845] A. I have, and found that he has followed my instructions.

Q. In this group of studies, you have divided your study between the two fields and then shown the aggregate for the two fields, is that correct?

A. Yes, that is correct.

Q. And have also shown the total cost of gas produced, and the total cost of gas purchased, is that correct? A. Yes, that is correct.

Q. Calling your attention first to Schedule 2 of Exhibit No. 142, this being the cost of gas purchased per M.c.f. by field on basic load, where did you get the amount paid per M.c.f. of gas?

A. That is the price within 1/100 of one cent. That is established by gas purchase contracts in the two fields.

Q. And the M.c.f. purchased for years shown on Line 21 comes from what point?

A. That comes from an exhibit that was prepared at Mr. Littman's request which bears the number of 132.

Mr. Littman: That is a copy of one of your working papers, is it not?

The Witness: That is right. The exhibit was prepared from working papers.

. . . . . .

[fol. 5846] By Mr. Culton:

Q. That is on the basic load?

A. That is on the basic load. That is the only one used in this schedule.

Trial Examiner: You had Exhibit No. 131, which was future production with the anticipated load increase, and No. 132, which was without the load increase, both prepared from your working papers, as I recall it and as the record seems to indicate?

The Witness: That is correct, and 131 will tie in with Exhibit 143.

Trial Examiner: Will 132 tie in to Exhibit 142?

The Witness: That is correct, yes, sir.

By Mr. Culton:

Q. Now, where did you get the transportation costs shown on Lines 4 to 19?

A. Those were obtained from Exhibit 43.

Mr. Littman: From what schedules in Exhibit 43, Mr. Hinton?

The Witness: From Schedule 3, Pages 1 to 3, inclusive.

Mr. Littman: You mean Pages 1 to 2, inclusive, for the particular figures which you have referred to?

The Witness: Yes, for the Panhandle Field that is correct. I was thinking in terms of the entire schedule 2.

. . . . . .

[fol. 5848] By Mr. Culton:

Q. Now, do you find the exact figures in Exhibit 43 that appear on Schedule 2 of Exhibit 142, or have you had to do some apportioning to get these figures?

A. The total is the same but the cost of transporting gas has been apportioned in the percent that the gas which is produced by the company and gas which is purchased by the company is divided.

Q. In other words, the transportation cost which appears on Schedule 2 must be added to the transportation costs shown on Schedule 3 in order to get the total for those various items?

A. Yes, that is correct.

Q. And you have apportioned all of the transportation cost between the produced gas and the purchased gas in proportion to the amount produced and the amount purchased? A. That is correct.

Q. That is true as to all instances where both the purchased gas and the produced gas use the same facilities?

A. Yes, where they use the same facilities, that is true.

Q. Now, for the year 1941, you get a total on Schedule 2 of 817,000 and then how is that applied to determine the cost of the purchased gas?

[fol. 5849] A. The amount which the company estimates that it will purchase for the year 1941 is divided into the amount of $817,635.

Q. And the resulting figure shown below represents the cost of gas purchased from the Panhandle Field for each of the years shown, taking into consideration only the elements to which you have referred?

A. That is correct.

Q. Then was the same plan followed in Lines 23 to 36 with respect to the Hugoton Field?

A. Yes, the same procedure was applied.

Q. Then in determining the weighted average cost of the gas for both fields, was that same method applied in Lines 37 to 40?

A. Yes, the same method applies.

Q. Passing now to Schedule 3 of Exhibit 142, purporting to show the production cost per M.c.f. by fields, basic load, what do Items 3 to 13 represent?

A. They include all of the production, operation and maintenance, including the land and lease operation, the royalties, rents, delay rentals, renewal bonus and taxes.

Q. How were the ad valorem taxes apportioned, I mean as between transportation and production?

A. The ad valorem taxes were all applied to the transmission, because it would not have been possible to have [fol. 5850] separated those in the time that was available to prepare this schedule.

Q. Well, I have not checked over this, but I notice that ad valorem taxes appear on the production schedule also.

A. That is gross production.

Q. It should be gross production instead of ad valorem—

* * * * * * * *

In other words, the taxes, so far as the produced gas is concerned, were applied to the production rather than to the transportation?

A. Yes, that is correct. Of course, it makes very little difference in which class they are thrown because the result obtained is the same.

Q. When it gets down to the total cost of the pro- [fol. 5851] ducing gas?

That is right.

Q. This item per M.c.f. produced for the years shown on Line 15, where do you get that figure, on Schedule 3 of Exhibit No. 142?

A. On line 15 the M.c.f. produced for the year?

Q. Yes, sir.

A. That is taken from Exhibit No. 132 which was prepared—

Q. (Interposing) From your working papers?

A. From my working papers.

. . . . . .

Q. Now, was that portion of Schedule 3 relating to the [Huguton] Field prepared in the same manner which that portion of the schedule relating to the Panhandle Field was prepared? A. Yes, it was.

Q. And Lines 35 to 39 representing a weighting of the prices for the various years?

A. Yes, that is a combination of both fields.

Q. Now, passing to Schedule 4, being the transportation costs per M.c.f. produced by fields, is that the cost as applied to the produced gas? A. Yes.

[fol. 5852] Q. And how were the transportation costs shown on that schedule obtained?

A. They were taken from Schedule 3 of Exhibit 43 and they were divided on the basis of the percents which were produced and purchased.

Q. The same way as the transportation cost on the purchased gas?

A. That it correct.

Q. Now, passing to Schedule 7 of Exhibit No. 142, a summary of the production and transportation costs by field, I am not certain myself as I have just [look] at that, whether those figures are weighted.

If not, they should be weighted, on Schedule 5.

A. Yes.

Q. Do you know whether that is an arithmetical total or a weighted total?

A. That is a weighted total which was obtained from the previous pages of this exhibit. They have already been weighted before being carried over.

Q. Then these figures show what the total costs of producing would be, the total transportation cost and the total from both fields, is that correct?

A. That is correct.

Q. Then was Exhibit 143 prepared in the same way that Exhibit 142 has been prepared?

[fol. 5853] A. Yes, sir, the same procedure was followed.

Q. And schedule 1 on each of those exhibits is a summary of those sheets which follow?

A. That is correct.

Mr. Culton: Mr. Examiner, may I suggest at this time that it might be advisable for Commission counsel, if he liked, to hold a round-table discussion about this.

There has not been time, frankly, for us to check it nor for them to check it either, and it might be, by taking a little while and holding what we, in some court cases, call a pre-trial conference, that the minds of all parties might get together more quickly on just exactly what this represents.

Trial Examiner: Mr. Littman, do you welcome this suggestion?

Mr. Littman: I do not believe that we are yet in a position where we can intelligently discuss these two exhibits without having first an opportunity to check the exhibit and to study the exhibit.

This exhibit involves a number of allocations and I might state, at first blush, it appears to be subject to some very serious mathematical infirmities. I say that, of course, subject to further study and check.

I do not think that we can be in a position to discuss this exhibit, cross-examine on it or to confer on it without having an opportunity to study both of these exhibits. I think perhaps we may be able to complete our study and check over the weekend. I want to facilitate the matter as much as possible, but I certainly would not want to go on record at this writing without [have] had an opportunity to further study the details of these exhibits.

Mr. Culton: I want to frankly say to counsel and to the Commission that this has been hurriedly thrown together and I have my serious doubts whether the items shown on Schedule 1 are correctly weighted.

I have my doubts whether the young man has weighted those figures.

Mr. Littman: That is what was disturbing us.

Trial Examiner: In view of the statement just made, the Trial Examiner will declare a ten-minute recess to permit Mr. Hinton to discuss and explain to the staff of the Commission and Mr. Littman the method of approach and the source of data which are involved at this point in consideration of these proposed exhibits.

(Whereupon, a short recess was taken, after which the hearing was resumed.)

Trial Examiner: Gentlemen, as a result of the conference which you have just concluded, have counsel some statement to make?

Mr. Culton: Mr. Examiner, as I suspected and as coun-[fol. 5855]-sel for the Commission had also immediately discovered when he looked at this exhibit, the young man who prepared it did not weight the costs shown on Schedule 1.

Therefore, Mr. Hinton desires to prepare a new Schedule 1 on each of those exhibits showing a weighted cost.

Trial Examiner: That Schedule 1 to which you refer is, in effect, the summary of the succeeding pages?

Mr. Culton: That is right. That is true as to both Exhibit No. 142 and Exhibit No. 143.

Now, we have also thought it might be of some advantage for Mr. Hinton and Mr. Dunn, representing the Commission, to get across the table this afternoon and check their figures and they might save the Examiner and the rest of us who are engaged in this case some time so as to be able to report Monday where there are any differences.

In doing this, we will be checking not only the figures which Mr. Hinton has caused to be made, but we will also be checking the figures which the Commission, in a hurried calculation, used several days ago, and I think we will arrive at what is unquestionably the arithmetic answer as to these particular matters.

There is no difference between Mr. Hinton and the Commission's staff as to the proper method to be used in

doing this. It is just purely a matter of arithmetic and using a comptometer machine.

* * * * * * * * *

[fol. 5856] Mr. Littman: I might state in connection with your statement, Mr. Culton, that a member of our staff is now checking Mr. Hinton's exhibits Nos. 142 and 143, and will be glad to meet with Mr. Hinton at the conclusion of this morning's session with a view to agreeing upon the mathematics of the exhibit.

I might state that we believe that our total unit cost figures which I read into the record a day or so ago are correct.

I cannot say at this time whether we will subscribe to any allocation of that total as between gas purchased and gas produced without first having an opportunity to examine carefully the method of allocation. I might say that personally, I cannot see that any allocation of transportation costs or any allocation of costs of operation and maintenance, as between purchased gas and gas produced, would make any difference in the over-all picture.

Mr. Culton: It should not, so far as the weighted totals are concerned.

Trial Examiner: You have in mind, when you say that it should not produce any difference, you have in mind [fol. 5857] the weighted average cost at Liberal?

Mr. Littman: The weighted average over-all cost at Liberal compressor station.

Trial Examiner: Yes.

Mr. Littman: Because this witness has testified to the precise amounts of gas that will be produced and purchased and delivered to Liberal for the next five years under the basic load theory and under the anticipated load theory.

Therefore, when we get the unit cost for the weighted average total at Liberal, in my judgment, then we have all that this Commission would need. However, if counsel for Panhandle Eastern wish to make a point of showing an allocated breakdown as between the two types of gas

which I mentioned, of course they are at perfect liberty to do so.

I wanted to make it clear, though, that we personally fail to see at this moment the necessity for the allocation. However, our staff will be glad to meet with Mr. Hinton and work together to the end that there will be no disagreement upon the mathematics of the figures.

By Mr. Culton:

Q. Mr. Hinton, these exhibits, No. 142 and No. 143, with respect to cost of production and cost of transportation include those costs south and west of the intake at Liberal station, is that correct?

A. That is correct.

[fol. 5858] Q. And include no costs for Liberal station and no costs from Liberal station east?

A. That is correct.

Q. In other words, your study has been related wholly to the question of delivering gas into the station at Liberal?

A. And to what might be better described at the field end of the main transmission line.

May I make some explanation there. Mr. Littman said that he could see no reason for separating these, and I might explain that they were handled in the manner that they were [was] to show that the cost of handling this gas is ever increasing and the cost of producing is increasing and, naturally, the purchase price remains the same because that is a contractual price.

Q. Is there any difference in the cost of producing and purchase, in your judgment, after 1946? Will there be any change in those respective costs?

A. Yes, there will be. You refer now to the handling and producing of gas?

Q. Yes.

A. Yes, they will, without any doubt, be ever increasing after that year.

Q. For the same volumes of gas?

A. For the same volumes of gas.

Trial Examiner: Why do you expect that, Mr. Hinton?

[fol. 5859] The Witness: Because as the pressures become lower in the wells, it is going to require a greater number of wells to furnish the same amounts of gas and the pressure, as it declines, will require that we install additional power in the field and additional fuel and help will be required.

Mr. Lee: Would that be true if you took your gas from newly-acquired fields?

The Witness: No, not at first. If we went to a field that had a higher pressure than these fields, it would not but, of course, this is limited to the Panhandle Field and the Hugoton Field.

Mr. Lee: Yes, but does your statement take cognizance of new acreage acquired in the Hugoton Field that might have a higher pressure?

The Witness: Yes, it does.

Mr. Lee: Do I understand, then, that that possible additional acquired acreage, of which you have already acquired about 30,000 additional acres, as I recall it, and which you may increase greatly in the Hugoton Field, will have a lower pressure at that time than it would if it were taken out?

The Witness: Wells that are drilled in the developed area, usually the pressure on these wells is found to be about the same as the pressure that is observed on the other wells in that area; and the fact that a well is drilled ten years from now does not mean that we will obtain [fol. 5860] near-virgin pressures on that well, but the pressure which we will obtain will be about the same as those on surrounding wells.

Mr. Lee: But nevertheless, is there a possibility that, if you drill this additional acreage ten years from now, it may have virgin pressure. Is that a possibility?

The Witness: That is a very rare possibility.

Mr. Lee: But, regardless of whether it is possible or not, you have treated it at what the pressure of the now-drilled wells will be at that time?

The Witness: Yes, sir.

[fol. 5864] Recross-Examination

By Mr. Littman:

Q. Now, I do not understand your answers to your counsel with respect to the differences between Mr. Davis' estimate of recoverable reserves for the Panhandle Field and yours.

You have stated heretofore in cross-examination that, as of the end of the year 1940, Mr. Davis' reserves in the Panhandle Field of 17 trillion cubic feet were approximately 70 percent in excess of your estimate. Is that correct? Haven't you so testified?

A. I believe that I have on the 17-trillion figure, but the 17-trillion figure is based upon an assumption that the [fol. 5865] field would be produced down to a pressure of 30 pounds equilibrium pressure.

Q. In other words, Mr. Davis assumed that 17 trillion cubic feet could be recovered down to 30 pounds abandonment pressure? A. Yes, sir.

Q. After September 30, 1940, is that correct?

A. I do not remember whether that figure was after September 30 or November.

Q. Well, it was as of September 30, 1940, but it would not make much difference whether it was September or November, would it?

A. No, it is not worth considering in this size reservoir.

Q. Now, you have heretofore in your cross-examination stated the amount of gas recoverable in the Panhandle Field as of the end of 1940, have you not? A. Yes.

Q. And what was that amount?

A. The cumulative withdrawals to the end of 1940 are shown on Exhibit 134 to be 8,325,985 M. M.c.f.

Mr. Wheat: That is a sum in excess of 8 trillion cubic feet, is it not?

The Witness: Yes, that is correct.

By Mr. Littman:

[fol. 5866] Q. You see, I am not asking for withdrawals. I am asking for your estimate of reserves, Mr. Hinton.

A. I thought you asked for the amount shown on this exhibit as of 1940.

Q. I am asking you to repeat your estimate of recoverable reserves in the Panhandle Field as of the end of the year 1940 as indicated by your Exhibit 134.

A. If we take the 21 trillion which I referred to, that being the largest amount, my testimony is that it is my belief that the amount of gas originally in place was between 20 and 21 trillion cubic feet.

Mr. Culton: That is the recoverable gas?

The Witness: Recoverable gas.

Mr. Littman: Will you read that answer back?

(Whereupon, the last answer was read by the reporter.)

The Witness: Now then, by deducting the total with-
[fol. 5867] drawal through 1940, we find an estimated remaining reserve of 12,675,015 M. M.c.f.

By Mr. Littman:

And that is your estimate of the remaining recoverable reserves in the Panhandle Field as of December 31, 1940?

A. At the rate of withdrawals shown on Exhibit 134.

Q. What does the rate of withdrawals have to do with it? You are going to recover that much gas whether it is recovered in the next 15 years or in the next 25 years, is that not correct?

A. That is not correct. The rate of withdrawal is the governing factor on the total amount of gas that will be recovered from this field.

Q. How does that affect the total recovery?

A. By the fact that if this rate of withdrawal continues, it is going to not give the gas time to migrate through the formation and the wellhead pressures will be considerably lower than if the rate of withdrawal was one-tenth of that shown on Exhibit 134.

You can see that there is a very definite thing to be kept in mind there on the rate of withdrawal when the total recoverable gas is considered.

Trial Examiner: Do you mean necessarily one-tenth less?

The Witness: I just mean that it would have to be much lower than this to enable the gas to flow from the [fol. 5868] areas of higher pressure to the well bores when the pressure in the field has been reduced to the point that it will be in the few remaining years and one-tenth was just a figure that I had in mind.

It might be produced at a somewhat greater rate than that and still obtain much higher pressure at the wellhead.

By Mr. Littman:

Q. Well, what abandonment pressure are you using in arriving at this 12,675,015 M.M.c.f. recoverable reserves as compared with Mr. Davis' 17 million M.M.c.f.?

A. That is zero pounds.

Q. Now, what would your figure be if you used Mr. Davis' 30 pounds of abandonment pressure? Your recoverable reserves would be lower, would they not?

A. Again, there comes in the rate of withdrawal to be considered.

Q. Well, suppose you state now your estimated recoverable reserves, using the 30-pound abandonment pressure, rather than zero which you used in computing the 12,675,015 M.M.c.f. figure.

A. You asked for the total recoverable reserves, did you not?

Q. Yes, indicated by your Exhibit 134.

A. At 29.65 pound wellhead pressure, my exhibit shows that the estimated amount will be 19,405,985 M.M.c.f.

[fol. 5869] Mr. Culton: That is well head pressure?

The Witness: Yes, sir.

By Mr. Littman:

Q How about deducting the withdrawals to the end of 1940 from that figure to get your estimated recovery? It is the estimated recoverable reserves that I want.

A. That would be 11,080,000 M.M.c.f.

Q. Now, Mr. Davis has estimated that the recoverable reserves in the Panhandle Field, as of very close to the end of the year 1940, is 17 million M.M.c.f., is that correct? A. That is correct.

Q. Using 30 pounds as the abandonment pressure, is that right?

A. That is right.

Q. And your figure, using 30 pounds as the abandonment figure for the recoverable reserves as of the end of 1940, is 11,080,000 M.M.c.f.?

A. That is correct.

Q. Now, will you tell me the process of reasoning by which you now claim that Mr. Davis' estimate, which appears to be approximately 6 million M.M.c.f. higher than yours, is the same as yours or even less than your estimate?

A. Mr. Davis estimated that there would be approximately 300,000 acres in the field that would have a gas content that would be only 60 percent of the average.

[fol. 5870] Mr. Culton: That is the average in the better part of the field, he said?

The Witness: Yes.

Mr. Littman: Just a minute. Where do you find that?

Mr. Culton: Page 6, Exhibit 75.

Mr. Culton: You had started on a statement when he broke in.

The Witness: Excuse me. I have to have it read back again.

(Whereupon, the last answer was read by the reporter.)

By Mr. Littman:

Q. Now, you can continue.

Mr. Culton: Exhibit 75, Page 6.

Mr. Wheat: Mr. Littman, you didn't finish your sentence.

By Mr. Littman:

Q. Will you continue your statement of the reasons why you now state that Mr. Davis and yourself have arrived at approximately the same recovery?

Mr. Culton: You understand, he never has made that statement.

The Witness. No, I have not.

Mr. Littman: What he said sounded very much like that to me.

Mr. Culton: He said if you apply Mr. Davis' computations, the differences on those two elements wherein he [fol 5871] differs from Mr. Davis, that his estimate will be in excess of what Mr. Davis' estimate is.

By Mr. Littman:

Q. Is Mr. Culton's statement a correct statement of your testimony? A. Yes.

Mr. Culton: Read it. In other words, that is what it is.

By Mr. Littman:

Q. In other words, if Mr. Davis had done certain things which you think he should have done in arriving at his estimate, it is your testimony that he would have arrived at approximately the same figure as that which you reached?

A. Yes. If Mr. Davis would have made the same interpretation of the reservoir size, as governed by the thickness of pay over the same number of acres, my estimate would have been in excess of Mr. Davis'.

Q. That is merely your way of pointing out wherein you and Mr. Davis didn't agree?

A. That is correct. I just wanted to show that on the general picture we are in agreement. It is just the interpretation of the data; and he is working with equilibrium pressures and I am working with wellhead pressures.

Q. Now—

Mr. Culton: (Interposing) Had you finished your explanation that you started to make?

[fol. 5872] The Witness: No, I was just—

Mr. Culton: (Interposing) Just show exactly what the difference is between your judgment and Mr. Davis' judgment.

The Witness: Well, in just round numbers, Mr. Davis has given 300,000 acres of the total field 60 percent as much gas as the acreage in the better part of the field; "better than average", he says.

Now then, my interpretation is—

Mr. Wheat: (Interposing) You mean better than average part of the field?

The Witness: Yes. My idea of that acreage in round numbers is that there will be about 400,000 which will have

approximate 50 percent as much gas as the better part of the field and there will be another additional 400,000 acres that will have considerably less, so by placing--

Mr. Culton: (Interposing) Less than 50 percent, you mean?

The Witness: Yes, less than 50 percent and that places my estimate on the portion of the field which Panhandle Eastern operates in excess of Mr. Davis' figure which he would apply there, working on average figures.

By Mr. Littman:

Q. Mr. Hinton, that isn't the way in which you arrived at the estimate of remaining gas in Exhibit 134?

A. No, I checked it by that method, the reservoir content required.

[fol. 5873] Q. Your estimate reflected in Exhibited 134 is predicated upon the rate of rock-pressure decline per M.c.f. produced, which rate is shown in the chart, Exhibit No. 135. Is that correct?

A. Yes, but I have also testified that if it would not have checked with known geological data rather closely, that I would not have used it.

Q. But in arriving at the figures shown in Exhibit 134 of the amount of M.c.f. which will be ultimately recovered from the Panhandle Field, you applied mathematically the rates of pressure decline per trillion M.c.f. produced in the field, literally, did you not?

A. Yes, as governed by rates of withdrawal.

Q. And the question of acreage and size and extent of the reservoir was just so much background rather than anything that actually entered into the calculation whereby you arrived at the figures in Exhibit 134?

A. Yes, that is right. It was a check on that method.

Q. Now, Mr. Hinton, in your redirect examination you gave some testimony with respect to an alleged connection between the Panhandle and the Hugoton Fields.

Did I understand you to say that in your opinion there was a connection between these fields in so far as the pay stratas are concerned?

A. Yes, I did say that was my belief, although it is [fol. 5874] yet to be proven by the drill.

Q. Is it simply your guess about the matter or is your belief based upon certain definite physical data?

A. My belief is based on certain definite physical data.

Q. And I presume that those data were derived from certain wells drilled in that vicinity?

A. Yes, the wells drilled in the two fields.

Q. Now, have any wells been drilled in this so-called narrow neck that lies between the two fields?

A. No, sir.

Q. I would like to have you state the physical facts upon which you base your conclusion with respect to the joining of the pay strata of these two fields, namely, the wells and showing the locations of the wells on one of the maps on the wall.

Suppose you refer to map, Exhibit 26.

A. Well, Mr. Littman, my belief is not based on any certain wells. It is based on all wells drilled in the two fields.

Q. Well, suppose you state the basis of your belief.

A. The basis of my belief is the virgin rock pressure in the two fields, the depth at which the pay lies in the two fields above sea level, the type of formation encountered in each of the two fields.

[fol. 5875] Q. Suppose you state the factors which caused you to believe that the two fields are physically joined.

A. The observed virgin rock pressure in the two fields is somewhere between 430 and 435 pounds on the wells that were originally drilled closest to the extension or outline boundary shown on Exhibit 26.

Q. How would that fact lead you to conclude that the two fields are joined?

A. Because it would certainly lead me to believe that in a gas field of this nature where the formation pressures are not normal that there must be some connection of the drive that built the pressure up to the point to which it was built, because I don't think that it could happen that there would be two separate fields that would have the same water drive that would produce the same abnormal pressure condition.

Mr. Wheat: The abnormal low pressure?

The Witness: Yes.

By Mr. Littman:

Q. Mr. Hinton, if there was a connection between these two fields, isn't it a fact that the extensive production from the Panhandle Field would have had its effect upon the rock pressures of the wells in the Hugoton Field, particularly those wells which are located close to the Panhandle Field?

A. That would be a reasonable assumption, Mr. Littman, but at the same time I refer you to the condition that [fol. 5876] exists between our Burnett 1-108 and our Burnett well 86. Within a space of approximately two miles there is a difference of over 100 pounds in the pressure.

I can readily see that that condition might exist there because there might be a tight area of extremely low permeability existing between the two fields which would still be the same general pay formation.

Q. Well, it would have to be very tight in order for the production in the Panhandle Field to have not reduced the pressure in the Hugoton Field in that vicinity.

A. That is true, but I still don't believe that we have the best information on that pressure condition at this time, and I think that there will be wells drilled which will definitely prove that.

Thinking in terms of geological data, it seems to certainly indicate that the two general series of lime were laid down during the same geological age.

Q. Maybe they were, but the point I am driving at is whether the pay strata of the two fields actually join.

A. That is my opinion, that they do, and it is based on the data which I have just given.

Q. Well, that was one of them, that was one of the reasons that you gave, to-wit, the fact that the virgin pressure in both fields was the same, approximately.

A. Yes.

[fol. 5877] Q. And you adhere to that, notwithstanding the fact that the virgin pressure in the Hugoton Field has remained the same, notwithstanding the production from the Panhandle Field. Is that correct?

A. Well, if you will notice, it is only very recently that the pressure in the Panhandle Field has been pulled

down lower than 50 pounds of virgin pressure in that field and if that is a tight neck in there, with that gradient in pressure coming from thousands of acres as slowly as it would be, it would be migrating from a considerable distance to fill that space up.

I don't believe that we are going to be able to tell definitely whether they are connected, only by drilling wells throughout the area where they might be connected.

Mr. Wheat: You mean "except" rather than "only"?

The Witness: Yes, except by drilling.

By Mr. Littman:

Q. In other words, you are not going to be altogether certain about your opinion with respect to the joining of these two fields until such time as the drill proves your theory?

A. That is correct. If we would have had proof, those two fields would have shown to be connected on Exhibit 26 instead of the space which is shown between the two fields on the map.

Q. Yes. Exhibit 26 clearly shows that the author of [fol. 5878] that exhibit did not join the two fields and shows a separate color for each field and white space between the two, does it not?

A. It also shows the south boundary in a dotted line which shows that in his mind he was not sure whether that was the southernmost possible extension of that field.

Q. And who was the author of Exhibit 26?

A. I don't know whether Dr. Bartle or Rufus Smith is the author of that.

Q. I believe I am correct in stating that Mr. Smith was the author of the lower part of the map which shows the Panhandle Field and that Dr. Bartle was the author of the upper part of the map showing the Hugoton Field and that they did, to some extent, collaborate with each other on both. Is that a correct statement, Mr. Culton?

Mr. Culton: It is intended to be correct but there is this inaccuracy, Mr. Smith said he adopted the Railroad Commission's map for the Panhandle Field. He drew the outlines for the Panhandle Field from that shown on the official Railroad Commission map.

He and Dr. Bartle worked together in preparing the map of the Hugoton Field.

By Mr. Littman:

Q. What other physical facts, if any, do you have which lead you to the conclusion that the two fields join? [fol. 5879] A. The fact that both fields produce gas from limestone which lies approximately the same elevation above sea level, indicating that the limestone was laid down during the same geological age.

Q. Well, now, you have named two physical facts, so-called by you, that led you to believe these two fields are joined. A. Yes.

Q. Now, both of those physical conditions could exist if there were a fault between the two fields, couldn't they?

A. No, they couldn't, because if there was a fault your lime would be encountered at different elevations.

Q. Both of those conditions could exist even though there were no connection between the two fields, could they not?

A. That is most certainly correct.

Q. Now, will you give us a third reason, if you have any, for believing that the two fields join?

A. I believe that I have given the principal reasons upon which my belief is placed.

Q. That is, you gave two.

A. Or two, rather.

Q. Two reasons. Now, would I not be correct in characterizing your ideas on this subject as simply a hunch that the two fields join, rather than a scientific conclusion [fol. 5880] from basic physical data?

A. No, I don't base my hunches on like facts. A hunch to me is something that you project in the future, but my belief is based on the pressure and the pay and I think that it is fairly safe to assume that the two fields are connected, but I am not going to bet any money on it.

Q. You wouldn't want to bet any money on it?

A. Yes, I would like to bet a little but I don't think I shall.

Mr. Culton: Whether they are connected or not doesn't affect any of your exhibits or any of your studies. You didn't take that, whether it is connected or whether it isn't connected, into account in any of your studies?

The Witness: No, I gave no,—that is, it bears no relationship to the problem.

Mr. Culton: Your expression of your judgment as to whether or not it was connected was in response to the questions by the Examiner inquiring as to the amount of drilling which has taken place in the two fields?

The Witness: There is one other thing which I neglected to tell Mr. Littman, and it is necessarily hearsay, because I am not a geologist, but I think that the geologists will tell you that the same fossils appear in that formation which, again, would indicate the same geological age.

By Mr. Littman:

[fol. 5881] Q. All these matters that you state you consider I might very well exist even if there were no joining of the two fields. Is that correct?

A. It is possible that they could exist, but not probable.

Q. At any rate, there is no present proof of the joining of the two fields, is there?

A. That is correct, there is no present proof.

Trial Examiner: May I ask further, following that up, whether the fact which is known would in any way affect data concerning which you have testified, indicating that in the south end of the field, if they are adjoining, in what is now known as the Panhandle Field, the migration of gas is much more rapid than in the upper part of the field which is known as the Hugoton Field?

The Witness: There is nothing involved in the connection of those fields that would change any of my testimony, costs, or capital additions, in any manner for the period considered.

Trial Examiner: In other words, a high degree of permeability of the producing strata may exist in the south end of the field as compared with the northern end of the field, irrespective of whether or not the fields are, in fact, connected?

The Witness: That is true.

Trial Examiner: And if they are connected together by [fol. 5882] ultimate exploration, the single field will then

have a north and south length of approximately 200 miles, will it not, more than 200 miles?

The Witness: Yes, it will be in excess of 200 miles.

By Mr. Littman:

Q. Mr. Hinton, in your redirect examination you discussed the subject of carbon black production in the Panhandle Field. Am I correct in understanding that at the present time carbon black is produced exclusively from sour gas in the Panhandle Field?

A. No, not exactly, because there are some sweet wells in one portion of the field there that I believe there is a special permit to use for the manufacture of high-grade carbon black.

They reclassified several wells down there during the early part of last year and it is in very few that that condition exists.

Q. In other words, substantially all of the carbon black produced in the Panhandle Field is produced from the sour gas, is that right? A. Yes, sir.

Mr. Culton: Well, sweet casing-head gas is used for that purpose, isn't it?

The Witness: Oh, yes, it is. That is the gas that comes from the oil wells.

[fol. 5883] By Mr. Littman:

Q. But most of it is produced from—

A. (Interposing) The majority of it is manufactured from gas bearing wells with sulphur content.

Q. What is the average field price of the sour gas in the Panhandle Field which is being used for carbon black purposes?

A. As far as I know, and I believe it is correct, .6 of one cent per M.c.f.

Q. Now, I believe you testified that the cost of treatment of sour gas, in order to sweeten that gas and make it usable for pipe line purposes, is one-half a cent to ¾ of a cent per M.c.f.?

A. Yes. I am speaking of just the operating cost without giving consideration to the expenditures required.

Q. I thought operating costs included expenditures. What expenditures are you referring to?

A. I am speaking of the money that will be required to build a sweetening plant?

Q. Oh, you are speaking of the capital expenditures?

A. Yes, sir.

Q. In other words, the one-half cent to ¾-cent figure represents all costs of processing, exclusive of the capital costs? A. Yes.

[fol. 5884] Q. Have you any idea of what the capital costs would be, approximately?

A. No, I don't know what a sweetening plant would cost, because there is no sour gas acreage available there and we have not gone into that.

Mr. Culton: It would depend, on the volume processed, what your plant would cost?

The Witness: Yes.

I neglected to say that that cost per M.c.f. would be on a large volume basis.

By Mr. Littman:

Q. Well, a pipe line company would naturally go into volume production; would it not?

A. Yes, I feel sure it would.

(Discussion off the record.)

By Mr. Littman:

Q. Don't you consider it a distinct possibility that pipe line companies will more and more turn to the sour gas fields for their supply, as the years go on, in the future?

A. Not unless it is done under a law. I am afraid it will never happen unless there is somebody that causes it to come about. I have a fear that it will never happen under the present laws.

Q. Well, as gas becomes more valuable and as the field becomes more and more depleted, isn't it a distinct possi-[fol. 5885] bility that pipe line companies will turn to the sour gas, being able to pay more at the wellhead for that gas than carbon black people are able to pay?

A. Yes, but it is under contract to the carbon black people and unless it would be purchased from the carbon black people, I don't know how that could be achieved.

Then, again, as the supply becomes depleted, why, then operating costs will go up to the extent that it will just

have to be worked out, whether it would be a paying proposition at that stage of the withdrawal from the field.

Q. Well, you don't think the carbon black people would turn down an offer, if it were attractive enough, to sell out to the pipe line people under the conditions that I suggested?

A. The carbon black plants are not operating without profit. Just because they pay .6 of a cent for the gas is no sign that that is all they make out of it.

Q. Do you know what the history of the Appalachian Field was in that regard? A. No, I do not.

Q. Don't you know that in the Appalachian Field the carbon black people have sold out to the pipe line companies and have virtually ceased production in West Virginia, for instance? Don't you know that?

A. Could you tell me—ar[illegible] am not trying to ask the attorney a question—what the price of gas is in the Appa-
[fol. 5886] lachian Field?

Q. Yes, I think I can tell you. I know that in West Virginia it probably ranges anywhere from 10 cents to as high as 20 cents per M.c.f. I know that the average field price of gas at the wellhead in the vicinity of Akron is 18 cents per M.c.f.

. . . . . .

The Witness: The reason I asked that question was because I just wondered what the price of gas would have to become before it would be possible to get the carbon black plants to stop using it for the manufacture of carbon black and sell it to pipe line companies.

By Mr. Littman:

Q. Well, I cannot supply you the figure that was reached when the carbon black people sold out. I am sorry I don't have that information for you.

A. I think you have a very good idea there, if it could be carried out, and it is one that I have given much thought to the past years, wondering how it could be brought about that sour gas would be processed and used for light and fuel purposes.

. . . . . .

[fol. 5887] By Mr. Littman:

Q. If the true weighted average rock pressures could be determined at intervals from the beginning of the field

and the volumes of gas withdrawn from the beginning during those intervals could be determined accurately, would you say that the production per pound drop of rock pressure in the Panhandle Field would be constant from the beginning?

A. It is probable that it would not be exactly constant because it is not a perfect resevoir.

Q. What do you mean by that?

A. I mean that if there is a resistance to flow through the formation and if the rate of withdrawal is in excess of the ability of the formation to prevent the passage of gas at the same rate without dropping the pressure, then in all probability it would not be the same throughout the life of the field because the pressures which would be obtained would not be taken at intervals after the wellhead had been closed that would be sufficient to enable the pressure to equalize throughout the field.

Q. Mr. Hinton, you are assuming something that I didn't assume in my question. I am assuming that you have the true weighted average rock pressures.

[fol. 5888] Mr. Culton: You mean by that the equilibrium pressure? If not, I would like to have true weighted rock pressure defined, myself.

Mr. Littman: It connotes more than equilibrium pressure. It means the exact, precise weighted average rock pressures.

Mr. Culton: In weighting what elements?

Mr. Littman: Weighting the volumes below the earth.

Mr. Culton: Weighting thickness, permeability and porosity?

Mr. Littman: Yes, that is right.

By Mr. Littman:

Q. You understand, Mr. Hinton, my question is transcending the matter which you just mentioned. I am asking you this:

If the true weighted average rock pressures could be determined at intervals from the beginning and the volumes of gas withdrawn from the beginning during those intervals could be determined accurately, would you say

that the production per pound drop of rock pressure in the Panhandle Field would be constant from the beginning? A. I would say that it would.

Q. Now, the reason why you claimed this result is not obtained from the data published by the Texas Railroad Commission for the five-year period, August 1, 1935, to August 1, 1940, is because the pressure data published by [fol. 5889] the Commission are not, in your opinion, the true weighted average rock pressures of the Panhandle Field?

A. They are not true equilibrium pressures, no, sir.

Q. And that is why you claim that a uniform production per pound of rock pressure decline can not be obtained? A. That is right.

Q. And the figures, the pressure figures that we are now discussing, are those which appear in Column 3 on Page 10 of Exhibit 42, are they not, in the last 4 lines, to be exact? A. Yes.

Q. That is, you didn't use the figure of pressure loss shown in the first line for any purpose, did you?

A. No, just merely to see how it looked.

Q. Now, you have stated certain reasons why, in your opinion, the pressures of the Texas Railroad Commission are not true weighted average pressures, have you not?

A. Yes, I have.

Q. And one of those reasons was that the well observations are not altogether accurate because wells are shut-in for different periods prior to the reading?

A. That is right.

Q. Now, I believe you stated the minimum period required by the Texas Railroad Commission is 72 hours? [fol. 5890] A. That is right.

Q. But no maximum period is required?

A. That is, also, correct.

Q. And, therefore, wells are read anywhere, as you stated yesterday, from 72 hours after the shutting-in of the well to as late as one month after the shutting-in of the well, is that correct?

A. Yes. That is on wells which are producing. There are a number of wells that are closed-in a year before the pressures are obtained.

Q. Now, of course, the longer you shut-in a well before reading, the more likely you are to get the equilibrium pressure. Is that correct?

A. Yes, the stabilization time tends to equalize throughout that area.

Q. In other words, after the well is shut-in, the pressure builds up higher and higher until it finally reaches the highest point that it can reach and then you have what is known as equilibrium pressure?

Mr. Culton: That would depend on whether or not other wells were producing out of—

The Witness: (Interposing) I thought you meant around the well bore.

By Mr. Littman:

Q. I meant around the well bore, any certain well.

[fol. 5891] A. I just wanted to add that some wells will build up in a few hours and others will still show a build-up at the end of several weeks.

At any rate, one of the reasons for inaccuracies creeping into these pressures published by the Texas Railroad Commission is the fact that wells are shut in for varying periods?

A. Yes, that is one of the factors.

Q. And, of course, one well may be shut-in 72 hours in one year and then be shut-in a month in the next year.

A. That is right.

Q. And, in your opinion, you would like to have the Railroad Commission specify a definite period before the reading is taken, would you not?

A. I think that is necessary in any field to obtain data that could be used for a straight pressure decline calculation.

Mr. Culton: Meanwhile what would the public do for gas if those fields were shut-in for a period of time?

The Witness: That is not what I meant.

Mr. Culton: I was speaking from the practical standpoint.

The Witness: Again, that is not what I meant. I mean that there should be a minimum and a maximum time for observing pressures.

By Mr. Littman:

[fol. 5892] Q. Now, as you stated a moment ago, all wells do not build up at the same rate; do they?

A. That is right.

Q. A highly permeable well will reach its equilibrium pressure much sooner than a less-permeable well, is that right? A. That is right.

Q. And so you have those differences, too, that enter into the figures of the Railroad Commission. Is that right? A. Yes, sir.

Q. Now, in that connection is it correct to state that the differences in the production or pull on the well immediately prior to the shutting-in and reading will have an effect upon the correctness of the observation? Is that correct?

A. Yes. It will have an effect on the correctness of the observation.

Q. Will you tell us why that is, briefly?

A. Because if a greater amount of gas has been pulled from the area immediately around the well bore it will, likewise, take a greater period of time for that gas to flow back into that same area to build the pressure up.

Q. Will you tell why, in taking the rock-pressure readings of your wells from year to year you will sometimes have a higher wellhead pressure in 1941 than, for instance, [fol. 5893] in 1940, notwithstanding the fact that considerable gas had been withdrawn during that period?

A. Yes, and another thing that sometimes happens it that the rate of withdrawal is retarded and the gas flows in faster than it has originally been [being] taken and there will be a pressure built up.

Q. Now, another reason that you gave why the pressures of the Texas Railroad Commission are not the true weighted average pressures, in your opinion, was the fact that the Railroad Commission does not weight the pressure readings against the pay thickness. A. That is right.

Q. This is the reason that you have referred to as the failure to take into account the fourth dimension?

A. That is right.

Q. Now, even if you weighted the pressures against the pay thickness, you still wouldn't have an altogether accurate result, would you, because of the differences in porosity of the pay sand throughout the field?

A. That is correct.

Q. You agree with Mr. Rufus Smith, who has previously testified in this proceeding, that the porosity varies greatly throughout the Panhandle Field?

A. Yes, sir, I do.

Q. So if you wanted to be 100-percent accurate about [fol. 5894] this fourth dimension, so-called, you would have to know the porosity and weight the pressures against the porosity as well as the pay thickness, would you not?

A. That is correct.

Q. And then you, also, gave some further reasons why the pressures of the Texas Railroad Commission are not the true weighted average pressures, namely, reasons such as the inability to precisely determine the exact location and proper location of the isobars on the pressure maps. Is that right?

A. Yes, that goes right back to the fault of the same class of porosity.

Q. So that these pressure figures of the Texas Railroad Commission are subject to all of these infirmities which you have enumerated and which I have recapitulated, is that right? A. Yes.

Q. And you have used those pressures, to-wit, the pressures published by the Texas Railroad Commission, in this study which you have submitted in Exhibit 42 and Exhibit 43. Is that right?

A. Yes, I know of no other source of information that is better.

Q. Now, I ask you to refer to Exhibits 136-(1) to (10), inclusive, showing the pressure-trends of the wells in the [fol. 5895] various areas. Now, are the wellhead pressures shown on these charts for the years 1941 and prior thereto those which have been reported by Panhandle Eastern and its vendors to the Texas Railroad Commission?

A. Only after the year 1935, and those are not reported to the Railroad Commission. Their representative actually conducts the taking of these tests and gives us the reading. We don't give it to them.

Q. Well, so much the better. They are, then, the actual readings which are used by and published by the Texas Railroad Commission, the Railroad Reports?

A. Yes, sir, that is right.

Q. And, of course, those wellhead pressures shown for the years 1935 to 1941 on Exhibits 136-(1) to (10), inclusive, are subject to all of the infirmities which you and I have discussed a moment ago, are they not?

A. Yes, one is quite likely to be one way and one another, so they are probably getting pretty close to the right answer by compensating errors.

Q. But never the true weighted average rock pressures? A. Unless by accident.

Q. Did you determine the rate of rock-pressure decline for the production in wells in Areas "A" to "G", inclusive?

A. You mean by individual wells?

Q. Well, by individual wells or by the average.

[fol. 5896] A. No, I did not.

Q. You had sufficient data, did you not, with which to make a separate determination of the average rate of rock pressure decline per unit of production which actually took place in the five years for each of these areas?

A. Yes, but I didn't have the time for this particular problem.

Q. You would have felt it advisable to do it, if you had had the time?

A. Oh, it would have been a nice check to see how the areas were comparing with the general trend of the field and to see where we might start encountering the sharper decline in these group areas. It would be a check figure.

I would like to have it on all the wells and I hope to be able to make it a part of the well record at some future date.

Q. You could have made a curve from the actual data in the Areas "A" to "G", inclusive, such as that curve which appears in your Exhibit 133, could you not?

A. Yes, that could have been done.

Q. The curves in Exhibit 133 show the story for the entire fields, sweet, sour, east, west and whatever else is included within the meaning of the entire and broad term "Panhandle Field." Is that correct?

A. That is correct.

[fol. 5897] Q. And you could have had that same information in chart form for each of the areas within which

Panhandle Eastern operates, to-wit, Group Areas "A" to "G", inclusive?

A. I do have such information, except that it is related to years and the withdrawal is shown on an accompanying exhibit rather than having the horizontal scale in M.c.f. to plot the total withdrawal.

Q. Well, but you haven't plotted the five years, 1935 to 1940, from your group areas on any chart so as to determine the rate of production per pound drop in rock pressure, have you?

A. No, I haven't, but I have checked many of them back and found them to run from an indicated content of about 9 million to 126 million per acre and I discarded them because they showed too many fluctuations to be of any value in projecting a line.

Q. Now, I would like to clear up a matter that you and I discussed during cross-examination and that is the manner in which you drew your curve on these pressure-trend charts, Exhibit 136-(1) to (10), inclusive.

Now, if I correctly understand, you are now referring to Group Area "A". You stated that you drew the curve extending beyond the year 1941 in accordance with your judgment. A. That is correct.

Q. And you enumerated the matters that you took into [fol. 5898] consideration. Now, will you state, again, the elements that you considered in drawing that curve, the items that caused you to assume the curve which is shown in Exhibit 136-(1)?

A. I am referring to Group Area "A" and the items which were taken into consideration in the placing of this judgment curve with the type of formation, the number of wells located in the area, the number of remaining locations to be developed by drilling, the rate of withdrawal, the trend of withdrawal and gave an over-all value to the general pressure-trend which I believe will be prevalent in the field.

Q. Now, the first element you mentioned was the "type of formation."

A. That is right.

Q. How did that affect the drawing of this curve?

A. By knowing what the probable migration of gas would be to the formation and that is based upon ob-

serving the number of hours required for the pressure build-up after the well has produced like amounts of gas.

Q. How did that element affect the drawing of the curve shown in Exhibit 136-(1)? Did it extend the curve or tend to steepen the curve?

A. It extended it.

Q. Extended it. How far?

A. Well now, I just haven't made any estimate of how far back it would be if we had the same general formation [fol. 5899] condition existing in "A" as we have in "E" and "F", but I would say that it would probably put that back there around 2½ years. That would be my estimate, knowing the withdrawal conditions around that area.

Of course, if we would have had those conditions over in Area "A", then the pressures which are shown on Exhibit 136-(1) would, in all probability, have been some 75 to 100 pounds lower than they are.

Q. Well, if I ask you to draw a curve on that chart, Exhibit 136-(1), taking into account all the elements that you state you considered except the one, namely, the first one that you mentioned, "type of formation," could you do it? A. Yes.

Q. And be exact about it?

A. No, because no judgment curve is exact. Something exact must be governed by mathematics and I don't think anybody else can put it on [their] exact.

Q. You wouldn't want to undertake to do it and say that it was an exact curve when you got through?

A. I would not.

Q. Let's take the second element, "number of wells." How many wells are shown in the chart, Exhibit No. 136?

A. There are 15 owned by the Panhandle Eastern and a total of 98 which are included in Group Area "A".

Q. A total of 98 in Group Area "A"?

[fol. 5900] A. Yes, sir.

Q. All right. How would you have drawn this curve if there had been half as many wells, let us say?

A. I would have tried to determine at about what years the undrilled wells would have been drilled before I would have placed a curve.

Q. Well, if I ask you to draw a curve on there that would reflect all of the elements of judgment that you

stated you considered, except the element of "number of wells," could you do it accurately?

A. No.

Q. You say you considered the number of remaining locations? A. That is right.

Q. How many remaining locations are there in Area "A"? A. Not very many.

Q. Well, just approximately? A. 33.

Q. Now, could you draw a curve on that chart, Exhibit 136-(1), which would represent all of the elements that you state you considered, excluding, however, the consideration of the number of remaining locations?

A. No, because I would have to go back and determine how much gas was to be taken from the wells drilled, approximately. I would have to get the withdrawal [fol. 5901] trend, is what I mean.

Q. You can't tell us, either quantitatively or qualitatively, the exact amount of weight that you gave to that element, can you? A. No.

Q. You say another element you considered was "rate of withdrawal." Could you draw a new curve on Exhibit 136-(1) that would reflect all the elements except the element of "rate of withdrawal"?

A. Well, if there was no rate of withdrawal and then that curve would just be the number of years behind, the way the field in all probability would go, that it takes the gas to migrate out into areas of withdrawal.

Q. Well, perhaps I should have said if you have varied the rate of withdrawal up or down, 15 or 20 percent, how would that affect your curve?

A. That would affect it in cumulative withdrawal, it would shorten the life if the trend was up, and if it was down it would lengthen the life.

Q. How much would it shorten the life and how much would it lengthen the life?

A. Well, I would say that if the withdrawal in Group Area "A" was half of what it is today in that type formation, it would probably lengthen the life of the field by some three or four years.

[fol. 5902 Mr. Galton: That is what area?

The Witness: The Group Area "A".

By Mr. Littman:

Q. But you can't be exact about that either, can you?

A. No, sir.

Q. And you cannot tell us exactly how much weight you accorded that element, can you?

A. No, sir, it is a combination.

Q. In the drawing of your curve—

Mr. Wheat: (Interposing) He hadn't quite finished his explanation.

You said it was a combination, of what?

The Witness: It is a combination of all things. If you try to project a curve without putting these all together, why, then you are going to have to be coming back and revising, which you do anyway, in the placing of this kind of a curve.

You think in terms of, now just what weight will that have, and that must be based on judgment.

By Mr. Littman:

Q. Now, you had an element that you call "over-all value to the general trend in the field." What is that?

A. Well, if we would lose sight of the fact that their total withdrawal from the east field is what it has been, why, then we would have an idea that there are areas in the west field that are of less value than they are. [fol. 5903] We know what the extreme trend in the east field is today. The curavture, the sharper trend of the curve was first noticed in the east field of the Panhandle Field and it was not noticed until after a great amount of gas had been withdrawn from the east field.

Then, the curve started to drop off requiring more pounds pressure to produce the same amount of gas each successive year.

Now, it is starting in the sour field. We know that if it is started in those two fields, that it is going to govern the west sweet field, therefore, as those pressures go down more gas will migrate from the west field into the east field and the west sour field and considerable weight must be given to the over-all picture in the field.

Q. Now, you say "considerable weight must be given" but you can't tell us how much weight you actually accorded the "over-all value" to the general trend in drawing these curves, can you?

A. No, I can't tell you in so many percents, because the weight of the whole field that is given in each of these group areas differs.

Q. Now, as you have stated in your direct examination, the drawing of these very vital and crucial curves,—and when I say "vital and crucial curves" I mean they are vital and crucial in your study, are they not?

[fol. 5904] A. Yes, they are vital and crucial to the life of the Panhandle Eastern Pipe Line Company.

Q. And they were drawn by you, as you have stated in direct examination, by free-hand? A. That is right.

Q. You have no working papers that show us precisely how you arrived at the curvature or course of these curves, have you? A. No.

Q. It is all a matter of what you have termed your "judgment," is it not? A. That is right.

Q. And we have no way to check the precise accuracy of these curves, have we?

A. There is nothing in the testimony about the precise accuracy of these curves.

Q. How accurate are they?

Mr. Wheat: What were you going to say?

The Witness: I say I do not contend that they are precise accurate, but I think that the end of the life of this field is going to find that they are going to approach being fairly accurate curves.

By Mr. Littman:

Q. And neither we nor anybody else has any way of checking your over-all judgment in that regard, have we?

[fol. 5905] A. Yes, you do.

Q. Following your methods step by step?

A. No? All you have to do is to figure out the reservoir required in that field.

Q. But we have no way of tracing your method step by step and determining whether you have accorded the proper weight for all of these component elements that

enter into the drawing of these curves, have we, Mr. Hinton?

A. No. I believe that if you would try to do this problem by straight mathematics, that you could turn over the data in its entirety to a man who did not know the Panhandle Field and the answer that he would get would not even approximate being accurate.

(Discussion off the record.)

By Mr. Littman:

Q. You have used the term "casing head gas" throughout your testimony. What do you mean by casing head gas?

A. The wet gas that is produced with oil.

Q. What do you mean by "produced with oil"? From the same strata or from different strata?

A. Well, the true casing head gas comes from the same strata; so-called casing head gas is the gas which is produced with oil that comes from the true gas-bearing formation which does not produce oil.

Q. Well now, certain casing head gas is dissolved in [fol. 5906] oil in its natural state, is it not?

A. Yes.

Q. And you recover it through the casing head along with the oil, do you not?

A. That is right.

Q. Now, there is another kind of gas that is produced by an oil well that is sometimes called casing head gas and that is gas which is produced from a separate strata as dry gas but is produced along with oil which comes from another strata. Is that correct? A. That is correct.

Q. Now, which of these two types of gas have you been talking about when you have used the term "casing head gas"?

A. Only the gas that came from the Panhandle oil and gas bearing formations.

Q. That is the first type which I have described, namely, the type of gas which is dissolved in the oil in its natural state?

A. Yes. After the formations are interconnected by drilling, if the other gas is not shut off, the gas pressure in the oil reservoir will be approximately the same as that in the gas. If I got your question right—

Mr. Culton: (Interposing) He is asking what you included in your withdrawals, I think. Isn't that right?

Mr. Littman: That is right.

[fol. 5907] The Witness: In the withdrawals it is only the metered casing head gas and that amount estimated to be blown into the air and the estimated amount came, supposedly, from oil bearing formation and the other amounts of casing head gas estimated in the early days was given consideration as the total withdrawal from the Panhandle Field.

By Mr. Littman:

Q. Well now, I am referring particularly to the table on Page 10 of Exhibit 42. In that table you show withdrawals from the beginning of the field down to August 1, 1940; do you not?

A. Yes, I am sorry. I misunderstood your question. That is all gas produced from the Panhandle Field. It is not any consideration for the gas that was originally stored in the oil reservoir.

Q. In other words, you have not included in those production figures any gas that in its original state was dissolved in the oil and recovered at the casing head?

A. Not unless it was in the same gas bearing formation as the Panhandle Field, the gas field proper.

Mr. Culton: In other words, you have included all types of casing head gas, true casing head gas and so-called casing head gas from the Panhandle Field?

The Witness: Yes.

By Mr. Littman:

[fol. 5908] Q. In other words, the figures do include all gas recovered through the casing head whether it was dissolved in its original state in the oil or not. Is that a correct interpretation of the answer?

Mr. Culton: I don't know whether he understands your question like I understand it or not.

By Mr. Littman:

Q. Suppose you tell us what kinds of casing head gas are included.

A. All kinds.

Q. All kinds of casing head gas are included in your production figures?

A. That come from the Panhandle gas field proper.

Q. In other words, you have included that kind which comes through the casing head from a different stratum than that from which the oil comes?

A. Yes.

Q. And, also, you have included the gas which originally came from the same stratum as the oil came from?

A. That is right.

Q. Even though it was originally dissolved in the oil in its original state, is that right?

A. Yes, that is right. I was thinking about so many different oil pools on the outside of the Panhandle Field proper.

[fol. 5909] Q. I just wanted to make certain as to what you meant when you said that you included all kinds and types of casing head gas.

A. In the Panhandle Field proper.

Q. In the Panhandle Field?

A. Yes.

Q. Well, that is the only field you are talking about or referring to in your table of Page 10 of Exhibit 42?

A. I guess that is correct.

Q. And in your opinion is it proper to include this kind of gas, to-wit, the kind that is dissolved in oil in its original state, for purposes of this study?

A. Yes, I think it is.

Q. Do you know whether or not the Railroad Commission of Texas includes that kind of gas in its production figures?

A. Yes, it does.

Q. In its production figures?

A. Yes, the casing head gas is included in the Railroad Commission of Texas, if you will look on the proper page of the Report.

Q. Well, but they talk about it in a separate text, don't they?

Mr. Culton: It is the same paragraph?

The Witness: No, it is just another column of figures to form the total.

[fol. 5910] By Mr. Littman:

Q. And in your opinion is all casing head gas classed as such by the Railroad Commission? By that I mean all types of casing head gas.

A. Far more so now than previously.

Q. They don't classify certain types or kinds of casing head gas as dry gas or other kinds of gas, do they?

A. Casing head gas is not a dry gas.

Q. I am asking you how the Railroad Commission classifies it?

A. And I answered that they do not classify it as dry gas. That casing head gas comes under one column.

Q. All types and types of casing head gas are referred to by the Texas Railroad Commission as "casing head gas"?

A. Yes, it being divided into two columns, one not treated, blown to air, for the figures used in Exhibit 42.

Q. Now, just one or two questions about capital additions which are set forth in Exhibit 42.

Do you have any authority, Mr. Hinton, to authorize the capital expenditures shown in Exhibit 42 from Pages 21 through 32?

A. No, sir, I do not have the authority to go ahead with those capital expenditures set out on those pages.

Q. In other words, before work can proceed, there must be, first, secured the approval of others in the Panhandle [fol. 5911] Eastern Pipe Line Company?

A. Yes.

Q. Who would have to approve all of these expenditures before they finally are made?

A. A gentleman by the name of Mr. J. D. Creveling.

Q. Anyone else?

A. No. If he approves them, it is all right.

Q. You don't know whether or not it is the practice of the company to have the Board of Directors approve expenditures of this type and character?

A. Well, they are probably submitted to the Board for approval, but the final approval to me comes from Mr. Creveling.

Q. Well, you are not certain whether, as a matter of practice the Board of Directors' consent is required or not, are you? A. No, sir.

Q. What is your authority in the matter?

A. After they have been approved, it is then turned over to me and Mr. Pope, and Mr. Pipe on the matters of production tells me when to proceed with the work.

Q. Mr. Pope is your immediate superior, is he not?

A. Yes.

Q. Well now, you stated, I believe, that all of the capital additions set forth for the first six months of 1941 on [fol. 5912] Page 21 have already been completed.

A. There are a few parts on the liquid separator that have not been installed yet.

Q. But the answer to my question is "yes" with some minor exceptions?

A. Right.

Q. Now, looking at the capital additions which you have set forth on Pages 21 and 22 and 23 for the basic load for the year 1942 and at Pages 27 and 28 for the anticipated load of the year 1942, will you state how much of that work has been actually authorized by the management of Panhandle Eastern?

A. All of it.

Q. Now, you say each and every item has been authorized?

A. There has been no one who told me to take off anything that is included on either of these lists and until they do there is no alteration of these capital expenditures.

Q. What do you mean by authorized? I have been asking you whether they have been authorized and you have been saying yes.

Mr. Culton: You haven't asked him whether he checked it with the management.

By Mr. Littman:

Q. Perhaps we better define what we mean by authorize. Have you been ordered by Panhandle Eastern to go ahead [fol. 5913] with the construction in 1942 which is set forth on these pages?

A. No. It is only about two weeks since the first of the year.

* * * * * * * *

Q. Let's be more specific then. Are there any work orders that have been signed authorizing this work?

A. Yes, the two compressors for Sneed station and the two engines for Hansford.

Q. Just a minute, let's get the items. You are now giving us the items which are subject to existing, signed, executed work orders, are you?

A. I don't know just exactly how many of those orders. I was going to tell you how much material has been ordered to show you about,—I thought you said you wanted to be very specific,—what had been done and I was just going to enumerate the items of material that had been ordered or received to date.

Q. Well, first let me ask you how many of these jobs for 1942 are now subject to existing, executed work words?

A. A work order is not—by "executed" you mean signed?

Q. Signed by the President of your company. He is the man who usually signs your work orders, isn't he?

[fol. 5914] A. No.

Q. Who signs them?

A. The superintendent of each department.

Q. Are you sure about that?

A. Yes. I have never seen one signed by the President of the company.

Q. There is a place on your work orders for the President's signature, is there not?

A. Maybe the copy I get is not the official one, because I don't recall anyone signing anything but a completion work order in our department at all.

Q. Well, at any rate, have you seen any work orders that have been signed by your superintendent,—I will put it that way,—for any of the work shown for the year 1942 under either the basic or anticipated load?

A. No, I have seen nothing more than the signature of Mr. Pope on items to be bought for this work. I have not seen any signed work orders.

* * * * * * * * *

By Mr. Littman:

Q. Now, looking at Item "G" on Page 21, which refers [fol. 5915] to the increasing of the capacity of the gathering line from Zofness to Sneed by looping the existing line between those points and the construction of an addi-

tional gathering lines to serve new wells, has the pipe for that job been ordered?

A. The number of tons of pipe required for that has been given a preference rating with the Priority Board, as I understand.

Q. Well, have you received any of it yet?

A. No, we probably won't receive it until,—we could lay it during the summer months at a much lower cost. If we had received it down there now it would cost us a considerable amount to store it until such time as we got ready to lay it.

Q. Are you sure that your are going to be able to get it?

A. I feel that we are going to because if has a very definite place in the defense industry, the field supply.

Q. Well, you can't be altogether certain about whether you are going to receive it or not.

A. Nobody can be altogether certain about anything this year.

Q. In the way of new construction?

A. That is right.

Q. And so you can't be altogether certain about whether all or any part of these items set forth in your [fol. 5916] list of capital additions in Exhibit 42 will be constructed, can you?

A. No, but I can assure you that Mr. Creveling has had this tonnage figured. I have even done some work on figuring tonnage since I have been here in Washington in order to try to see if we could reasonably expect to get the amount of steel required or if there was any manner in which we would be able to furnish additional gas to the industrial factories making defense products whereby we might use a smaller amount of gas, even though it did not exactly fit in with our contemplated development plans.

Mr. Littman: I think it would be well for this witness to state how far the plans or work has progressed with respect to the items shown for the year 1942, at least.

Mr. Culton: Ask him.

Mr. Littman: And I was going to suggest that perhaps we better do that on Monday. It is one o'clock. It may

give this witness a little opportunity to be better prepared to go right down through the list.

Mr. Culton: Can you do it right now, Mr. Hinton?

The Witness: Yes.

Mr. Culton: Do you need any further preparation?

The Witness: No.

. . . . . .

[fol. 5923] Mr. Culton: Mr. Examiner, Saturday afternoon the Examiner suggested that we might be able to get together on Exhibits 142 and 143.

Following out that suggestion Mr. Hinton for Panhandle Eastern and Mr. Dunn of the Commission's staff spent several hours checking all of their computations and late Saturday afternoon reached a full agreement as to the arithmetic of all the figures.

Yesterday Mr. Littman was kind enough to come to his office and go over all of these figures with Mr. Dunn and we are now in full accord with respect to the arithmetic of Exhibits 142 and 143.

I will say that substantially there is practically no change in the figures in which Mr. Littman was interested, between these figures and the figures reflected in his cross-examination of Mr. Hinton earlier in the week and there is practically no difference in this exhibit between Mr. Hinton's figures and those shown in the exhibit, aside from the fact that a weighting was not given to Page 2, on Schedule I of each exhibit as we suggested to the Examiner last Saturday.

In order that it may be more easily understood, we desire to remimeograph one or two pages of each exhibit and during the weekend it wasn't possible to get this done. We will turn it over to be mimeographed today and [fol. 5924] will get Exhibits 142 and 143 in final form.

We will desire to substitute those new sheets in Exhibits 142 and 143 so as not to have a lot of duplication.

. . . . . .

Trial Examiner: The conference, to which you referred, yesterday obviated the necessity of further cross-examination of Mr. Hinton, am I to understand, Mr. Littman?

Mr. Culton: There is this further explanation I might make, we are to get, Mr. Littman, some information from the Kansas City office. Mr. Hinton is to prepare that in the form of a letter and send it back to him. I think that should be stated.

Mr. Littman: In answer to your Honor's inquiry, if Mr. Hinton's figures in Schedules 1 in Exhibit 142 and Exhibit 143 had been correct in the first instance, I doubt very much whether we would have had any cross-exam-
[fol. 5925] ination of Mr. Hinton on these schedules.

Mr. Culton: You mean, had the average been shown rather than the totals as was suggested at the hearing Saturday.

Mr. Littman: Yes, If the weighted average had been shown.

Mr. Culton: That is right.

* * * * * * * * *

I think a statement by me might be in order at this time in order that there will be no misunderstanding at any time with respect to Commission counsel's position on this matter of Exhibits 142 and 143.

I trust that your Honor will grant me the indulgence of making a brief statement and review of the situation.

When Mr. Hinton presented Exhibit 43, particularly the Schedules 3 and 4 of that exhibit which contain his estimate of operation and maintenance costs west of Libral compressor station for each of the two gas fields, to-wit, Panhandle Field and the Hugoton Field, under both the basic-load theory and under the anticipated-load theory, it was obvious to us that unless these total dollar figures were related to the amounts of gas produced and purchased in each of these fields under each of these two theories, they would be without any real significance in this proceeding. In brief, Schedules 3 and 4 merely show Mr. Hinton's estimate in total dollars for each year, for each of the years 1940 to 1946, both inclusive.

As your Honor will observe, there is a steady increase [fol. 5926] in total dollars for each of those years shown in Mr. Hinton's estimate of operation and maintenance costs west of Liberal compressor station in Exhibit 43, schedules 3 and 4.

Now, nowhere in Mr. Hinton's exhibit 43 was there shown the amounts of gas purchased and the amounts of gas produced under each of these bases nor did Mr. Hinton's exhibit or testimony show the amount of money he contemplated would be expended by the company for gas purchased.

In view of that situation I thought it would be well, in fact necessary, to have Mr. Hinton prepare a copy of his working papers showing the breakdown of the amounts of gas purchased and produced. That has been submitted by Mr. Hinton at my request as Exhibits 131 and 132.

I felt it was necessary to interrogate Mr. Hinton with respect to the cost per M.c.f. expected to be paid by Panhandle Eastern for gas purchased in each of the years 1941 to 1946, inclusive.

Now, with that data at hand, it then became very simple to combine the total cost of gas purchased, as contemplated by Mr. Hinton's estimate in each of the future years under each of the two bases with his total estimate of operations and maintenance costs and to take the total of those costs and divide by the number of M.c.f.'s proposed under both bases to be delivered to the Liberal compressor station for each of those years.

[fol. 5927] It then became purely a matter of mathematics to divide the dollars by the total number of M.c.f.'s and secure what we have referred to as a unit cost but which might be more accurately referred to as an average cost per M.c.f. of all gas delivered at the intake side of the Liberal compressor station for each of the years 1941 to 1946, inclusive, showing the average cost per M.c.f. of both gas purchased and gas produced, combined, from both fields under both the base-load theory and the anticipated-load theory.

Now, I read into the record, in order to save time, certain average M.c.f. figures for that purpose, which I asked Mr. Hinton to check. In making that check Mr.

Hinton undertook to make a separation of the average cost as between the cost of gas produced and the cost of gas purchased.

This separation required certain allocations. He, also, produced a breakdown which, to our mind, is wholly immaterial and irrelevant for the simple reason that when we have the total amount of gas produced, purchased and delivered to Liberal under both theories, to-wit, under the basic-load and under the anticipated load, that is all we are interested in.

We are, of course, interested in the average cost of both types of gas, that is the gas produced and the gas purchased, combined.

Now, Mr. Hinton, in presenting Exhibits 142 and 143, showed this breakdown or allocation which was done not [fol. 5928] at our request. As I stated, we were interested wholly in the average total figure for all gas delivered at Liberal.

Now, as your Honor knows, Exhibits 142 and 143 showed in Schedules 1 of each of those exhibits a so-called total average cost for the Panhandle Field and for the Hugoton Field and for the main line.

The record already shows that in order to secure a proper total it would be necessary to weight the amounts against the number of M.c.f.'s produced and purchased in total.

Now, when your Honor suggested that we have a conference in order to determine the mathematical correctness of the average figure, we did just that over the week-end and a member of our staff worked with Mr. Hinton to the end that the correct mathematical average total for the Panhandle, Hugoton, and for both fields combined be introduced into the record and that is the figure in which we are interested.

Now, I simply want it understood beyond any question that our participation in this conference was solely for the purpose of saving time on the record and in order to secure a correct mathematical total average figure.

We do not feel that any allocation as between gas produced and gas purchased is material to the issues in this proceeding. When I say that we worked with Mr. Hinton toward the end that the correct mathematical figure be shown, I would also like to have it distinctly under- [fol. 5929] stood, Mr. Examiner, that we do not agree, necessarily, that these are the true average costs. These average costs are all, of course, bottomed upon the validity and accuracy of all of the various assumptions and estimates that Mr. Hinton made.

In other words, they are, in reality, a rearrangement of certain of Mr. Hinton's own basic figures. For example, cross-examination revealed that Mr. Hinton's Schedules 3 and 4 included certain costs taken from the books of the company as the purported cost of fuel.

It is clear on this record that a credit must be allowed for such amounts in order to get at the exact cost.

Mr. Culton: Mr. Littman, don't you think it fair to state that I called your attention to that in connection with your figures and you said that there was no occasion to take that into consideration, because you only wanted to show the general trend and I told you at that time that to get it to a fair basis, that is, to an absolutely accurate basis, we would have to deduct the fuel cost, and, also, we would have to divide the M.c.f.'s actually delivered into Liberal rather than the M.c.f. produced and the M.c.f. purchased.

I don't think there is any difference between us.

Mr. Littman: I don't think there is any difference between us. That is why I said that it is clear on the record that everyone is agreed that these totals that we are interested in do show and I am sure they will show this [fol. 5930] when the corrected Schedules 1 are offered for Exhibits 142 and 143 and that is that there is a definite trend downward through the years under both the basic and anticipated load.

I trust that I have made myself clear.

Now, in connection with Mr. Hinton's testimony of capital expenditures, your Honor will recall that I was en

gaged at the close of Saturday's hearing in cross-examining Mr. Hinton on that subject.

Inasmuch as Mr. Hinton's presence was required on the system, we believed that the necessity for recalling him for cross-examination today could be obviated by Mr. Hinton furnishing us a statement for the record which would bring out the things that I had proposed to cross-examined him about this morning.

Mr. Culton was requested by me to have the witness furnish the following data and information with respect to the capital expenditures under the anticipated load which are shown by items in Exhibit 42 from Pages 26 to 32, inclusive.

Here is the information that we would like to have furnished to us in statement form.

Mr. Culton: I am getting more than you requested if counsel want it, I am going into much more detail on that statement than you requested of me.

Mr. Littman: Don't you think it is well to put on the record what Mr. Hinton is to get?

. . . . . .

[fol. 5931] Mr. Culton: Go ahead. I will say "yes" when you get through.

Mr. Littman: We requested the following information by items, that is, by the same items that are listed in "A" to "N", inclusive, on Pages 26 to 32 of Exhibit 42.

First, which of these items are actually in the process of construction? As to those items which are now in process of construction, the progress which has been made to date in that construction.

Secondly, as to those items which are not now in the process of actual construction, we would like to have the following information:

"A" Has a work order been approved and signed by the management authorizing the work to be done?

"B" What materials, if any, are on hand?

"C" What materials, if any, have been ordered and the delivery date on which delivery is expected.

Mr. Culton: Well, now, wait. You didn't give me that. We have ordered it. We can't tell you when we are going to get deliveries under present conditions. You didn't give me the delivery date.

[fol. 5932] Mr. Littman: I was reading from this paper. You see the reason why it is well to put these matters on the records

Mr. Culton: You didn't say anything about delivery date. I can't tell you when. All our deliveries are for shipment as soon as possible.

Mr. Littman: All I request is, if the delivery date cannot be stated due to the uncertainty of conditions, Mr. Hinton may so state.

Mr. Culton: We will just make that general statement as to all of it, then, when we get through, because you know conditions in the industry now are such that nobody can promise you delivery.

* * * * * * * *

Mr. Culton: The only thing we can say is that we will have ordered all of this for delivery as soon as they can deliver it. That is as far as we can go under the priority situation.

One of the things we are going to give you is the priority orders that we now have. You didn't request it.

* * * * * * * *

Mr. Littman: Suppose you do the best you can, and that is all we can expect anyone to do, with respect to giving us your delivery situation.

[fol. 5933] Fourth, as to any items that deal with pipeline construction we would like to know whether or not the rights-of-way have been acquired.

As you indicated to me yesterday, Mr. Culton, no rights-of-way are required for well lines, of course.

Mr. Culton: You have that in the lease.

Mr. Littman: Yes, but as to the gathering lines.

Mr. Culton: Mr. Hinton is getting that information.

* * * * * * * *

[fol. 5939] C. H. M. BURNHAM a witness, having been previously sworn, resumed the stand and testified further as follows:

* * * * * * * *

[fol. 5940] Cross-Examination (Continued).

By Mr. Littman:

Q. Mr. Burnham, you have heretofore testified on direct examination with respect to Exhibit 47, entitled "Panhandle Eastern Pipe Line Company and Subsidiary Companies—Future Capital Requirements, Gas Transmission Facilities—Liberal Station and Eastward", have you not?

A. I have.

Q. Will you please state, step by step, the procedure followed by Panhandle Eastern Pipe Line Company in undertaking to make new capital additions?

That is to say, what is the first step, and go on through the various steps until the time when the work is actually done.

A. Well, I should say the first step consists of close observation of our load as experienced each winter. That is, the operating organization, knowing the capacity of the system, that is, the calculated capacity, will watch each winter's performance of the then-installed facilities.

Such observation will indicate how much of the installed capacity is being used. Then, by observing the estimate for the following winter—

Mr. Culton: (Interposing) What estimate do you refer to there?

[fol. 5941] The Witness: The estimate of the load to be carried the following winter.

- - - it is a simple matter to deduce the fact that you are either going to be short or long on capacity.

Now, during the winter of '40-'41, the peak load was in excess of 240 million. The installed capacity at that

time was approximately 250 million but, by observing the weather conditions during that winter, it was apparent that the temperatures were above normal on our system so, by applying a correction factor, we could readily see that had it been a normal winter, we would have used up or needed the 250 million then-installed capacity.

As I stated before, the estimate for the winter of '41-'42 was then given close scrutiny and it was deduced from that observation that in order to protect our customers, more capacity must be installed previous to the coming winter.

That is the winter of '41-'42 I am talking about now.

By Mr. Littman:

Q. Once having decided that, it was necessary to increase the installed capacity of your pipe line system east of Liberal station. What is the next step taken?

A. The next step then consists of making what we call the "flow studies". Those studies are made in the engineering department.

Q. Of which you are the head?

[fol. 5942] A. That is correct, and the load is carried, as I described here in my previous testimony, through a series of computations which will develop the looping required as well as the additional horsepower required in each station, if each station, in that case, is short of power.

Having completed the study, these are then turned over to the management.

Q. When you speak of the management, to whom do you refer, the Board of Directors or certain officers, or both?

A. I refer to Mr. Neuner, Vice President in charge of operations.

Mr. Goodwin: One question, you made reference to having completed the study.

Now, precisely what is meant by the study?

The Witness: The study consists of complete computations showing what pipe and power are required to meet the estimated peak to be experienced during the coming winter.

That is summarized and only the summary is handed over to the management.

Mr. Goodman: Now, that is a routine study?

The Witness: You might call it routine or you might not. It is a very involved and complicated computation.

Mr. Goodman: By "routine", I mean something you do every year.

The Witness: Yes, it is.

* * * * * * * * *

[fol. 5943] By Mr. Littman:

Q. Is such a study made for one year in advance or is it made usually for a number of years in advance?

A. It is usually made only for one year in advance, but, in the case of the group of studies that I handed you some weeks ago, it was made, of course, for a number of years in advance.

Q. That is in connection with Exhibit 47?

A. Correct.

Q. And what loads did you use as the basis for the study summarized in Exhibit 47?

A. The loads estimated by Mr. Morton.

Q. And that estimate of Mr. Morton's is contained in Exhibit No. 40, is it not?

A. That is correct.

* * * * * * * * *

Mr. Goodman: Does that particular study assume that [fol. 5944] the loads, as indicated by Mr. Morton, will be carried?

The Witness: With certain corrections, yes. We have taken Mr. Morton's load and deducted from it what we call the readily interruptible gas. Then we assume that the balance must be carried.

Mr. Goodman: Now, at what stage in the process and progress of expansion is it determined whether or not the loads as determined by Mr. Morton, will be carried, in other words, whether it is desirable business?

The Witness: Well, I don't know whether I can answer that question or not. Mr. Morton has had in the past a

very uncanny ability to predict the load for the coming winter.

Now, at what stage during this process the management accepts his estimate for the next winter, I do not know.

Mr. Goodman: I do not think you get my question. You are increasing, fairly constantly, the number of your customers. Now, are the arrangements made to increase the number of customers and thus sell more gas prior to Mr. Morton's estimate or subsequent thereto?

Mr. Culton: You mean for new markets, don't you, Mr. Goodman?

Mr. Goodman: Yes.

Mr. Culton: Not additions to existing markets but for new markets?

Mr. Goodman: For new markets, that is correct.

[fol. 5945] The Witness: Well, I should say that, in so far as I know, the contracts for new markets are negotiated and if they are consummated, then Mr. Morton takes them into account in making his estimates of peak loads.

Mr. Goodman: In other words, Mr. Morton does not take in new markets until subsequent to the making of a contract.

The Witness: That is true in cases of large contracts, but Mr. Morton does reflect in his estimate, I happen to know, the normal growth which the property will experience.

Mr. Goodman: Yes, I see.

Now, in connection with large contracts, as you have distinguished it, as distinguished from normal growth, does your department determine the justification for making those contracts?

The Witness: We make no computation in respect to that.

Mr. Goodman: Who does, do you know?

The Witness: I do not know whether any computations are made.

Mr. Goodman: In other words, then, you, as Chief Engineer, tell us now that you do no work in advising the management concerning whether or not it is good business to supply a new market?

The Witness: Well, there are several instances where I have. I will have to retract somewhat on that.

Mr. Culton: You did do it on the Consumers Power deal?

The Witness: Yes, that is the one instance where I did [fol. 5946] advise them and Mr. Morton, I happen to know, made economic studies for these contracts recently entered into in Illinois, Indiana and Missouri.

Mr. Goodman: So, in other words, we are down to the fact that unless you are specifically requested, Mr. Morton's economic studies concerning plant extensions for new markets are the only ones which advise the management on the propriety and profits of supplying the markets?

The Witness: In so far as I know, that is correct.

Mr. Goodman: But Mr. Morton's economic studies are transmitted to you, are they not?

The Witness: For capacity purposes only.

Mr. Goodman: Only for capacity purposes, and the result is that you do not modify those studies or participate in them but pass them on to the management in the form as supplied by Mr. Morton?

The Witness: That is correct.

Mr. Goodman: All right.

By Mr. Littman:

Q. You are the Chief Engineer of Panhandle Eastern Pipe Line Company, are you not? A. Yes, sir.

Q. Now, Mr. Burnham, will you please continue with your step by step description of what transpires when Panhandle Eastern undertakes to determine whether it [fol. 5947] shall install additional pipe line or horsepower capacity.

A. As I stated before—

Mr. Goodman: (Interposing) Can I interrupt once again, at this time, because I think it is right along the line.

Mr. Morton has supplied his counsel and his counsel, in turn, has supplied me, with a certain number of estimates, being the total summaries of his economic studies made over the past two years.

Now, subject to the hope that I have them all here, as I think I have, I will hand those studies to you and I will ask you to verify, if you can, whether these comprise all of the economic studies made and transmitted to you by Mr. Morton during the past two years.

Perhaps I had better mark these sheets for identification.

Trial Examiner: Do you care to limit that inquiry to the territory in which you are definitely interested, the Michigan territory?

Mr. Goodman: No.

Trial Examiner: The material, as offered, is, of course, all-inclusive.

Mr. Culton: He has furnished all-inclusive data, I think.

Mr. Goodman: Yes, purported to be all-inclusive, your Honor.

Trial Examiner: These tables consist of how many pages? Do you want to designate the number of pages?

. . . . . .

[fol. 5948] Mr. Goodman: I would like to assign a number to the total pages and use a subnumber for each page.

There are 23 pages.

Trial Examiner: This will be marked for identification as Exhibit No. 144, with the component 23 pages being separately marked serially, 1 to 23, both inclusive.

. . . . . .

[fol. 5950] (Exhibits Nos. 144-1 To 144-23, Inclusive, Were Received in Evidence.)

. . . . . .

[fol. 5951] Mr. Goodman: Yes, I will, your Honor. It will take me a little time, though.

Mr. Burnham, these, consisting of the sheets of Exhibit 144 represent the economic studies which were made by Mr. Morton and furnished you, is that right?

The Witness: I would not say that all of these had been furnished to me. For instance, the letter addressed to Mr. Creveling, I do not believe I ever saw it before. However, in the majority of cases, that is true.

Mr. Goodman: And there is no other work in the nature of economic studies which Mr. Morton has done in the past two years which has been furnished to you, is that right?

The Witness: These consist of all the studies I have knowledge of that he made.

Mr. Goodman: And do these studies originate any of your planning work?

The Witness: I referred to the matter a while ago, that we use these studies for capacity purposes. Now, what I meant by that was that we furnished Mr. Morton the size of the lateral line required to serve these markets as well [fol. 5952] as the estimated cost of such lateral.

Mr. Goodman: And after Mr. Morton makes this study, you proceed to follow [out] your plans for the installation of these laterals?

The Witness: After Mr. Morton has made his study in which he has incorporated estimates furnished him by my department, the study, as I understand it, is then turned over to the management for its decision.

If the decision is favorable, a budget is prepared. The budget is prepared in my department and, after the budget is approved, then we take steps to complete the construction of the facilities required for these particular markets.

Mr. Goodman: Now, is that something independent of your main-line capacity studies?

The Witness: I would say it is independent.

Mr. Goodman: I see, so that at the same time, you are taking care of two types of capacity development or rather of pipe-line development; one having relation to making your mainline capacity applicable to serve the market for the ensuing year, and another dealing with the actual installation of laterals to serve additional markets, is that correct?

The Witness: That is correct.

Mr. Goodman: And are they kept separate?

The Witness: Yes.

Mr. Goodman: Did you ever add them together?

[fol. 5953] The Witness: Mr. Morton adds them when he makes his estimate for the following winter load.

Mr. Goodman: I see.

* * * * * * * *

By Mr. Littman:

Q. Now, Mr. Burnham, will you please continue with your step by step description of the procedure in connection with the installation of capital additions?

A. Concerning the main line?

Q. Of course, your exhibit relates to main lines and compressor stations, does it not?

A. That is correct.

Q. Suppose you give us the details with respect to that and then, if there is any variation from that procedure in respect to other capital additions, you might state what variation there is when you get through.

Mr. Wheat: When you said, "your exhibit", you refer to Exhibit 47, do your not?

Mr. Littman: Yes.

The Witness: Well, as I was about to state, the flow study, summarized with an estimate of the costs involved, is handed the management and it shows the approximate dollars required to expand the plant sufficiently in order [fol. 5954] to carry the load, which load is taken from the estimate furnished by Mr. Morton.

* * * * * * * *

Q. I see. You may proceed with your description.

A. We may not hear from this summary or this flow study for some weeks but, in any event, when the decision does come through, the engineering department is advised to draw up the budget.

Q. Can you tell us what transpires during those two or three weeks? Do you know who looks at these estimates and what action, if any, is taken?

A. In so far as I know, Mr. Neuner takes them up with the New York Office and what goes on in New York, I have no definite knowledge about but, in any event, my department is primarily interested in the answer, whether it is favorable or unfavorable and upon the receipt of the answer, we immediately start the preparation of the budget.

Q. Now, what form does that answer take? Is it in [fol. 5955] writing?

A. Not to my knowledge. Usually Mr. Neuner will advise me by word of mouth to prepare the budgets.

Q. And he returns your estimates?

A. I have a copy of the estimate.

Q. I see.

A. He has, on some occasions, written me with respect to some small projects such as small lateral lines, in order that everyone be advised of the favorable action of the management.

Q. Then what is done?

A. The budgets are prepared.

Q. By you?

A. By my department, under my direction.

Q. Then what do you do with those budgets?

A. The budgets are turned over to Mr. Neuner after they have been properly signed. They are signed by quite a number of the officials of the company in the Kansas City Office before they are turned back to Mr. Neuner.

Q. Then what is done with them?

A. They are sent to New York and Board action is then taken on them.

Q. Then what occurs after the Board of Directors votes favorably upon the particular matter?

A. We are advised of favorable action by the Board and [fol. 5956] if it calls for immediate construction of the project involved, the materials are purchased and steps are taken to let the contracts for the work.

Q. Now, at what stage of this procedure does a work order issue?

A. After the budget has been approved and as soon as some expenditures are about to be made with respect to the budgeted amounts or items, a work order is issued.

Q. Who signs the work order?

A. The work order is issued in the Accounting Department and I do not believe it requires a signature. I say that because I have copies of some and I do not remember that any signatures occurred on them, other than the Accounting officers.

. . . . . .

Q. But, at any rate, no work is done until such time as a work order is actually issued, is that correct?

A. Well, in some instances where we know that certain work has to be done where the management has given us informal approval, as you might say, to pursue the engineering work, in that case a work order is issued to cover just preliminary expenses such as drafting and engineering studies.

Q. But I was asking about the actual construction. No actual construction is embarked upon until you first receive the work order?

. . . . . .

[fol. 5957] A. (interposing) No actual work is embarked upon until we receive the work order.

Q. Now, I refer you to your Exhibit No. 47 and particularly to Line 2, which has an item of "Additions to Main Lines" for the year 1941 in the amount of $4,292,500.

Are all of those lines shown in your map, Exhibit 15, by purple dotted lines?

A. Yes, sir.

Q. Am I correct in stating that all of the work embraced by that item is the looping of the main transmission line?

A. Yes, that is what the title infers, additions to main lines, referring to main-line loops.

Q. And this work was to be done in the States of Illinois, Missouri and Kansas, is that correct?

A. That is correct.

Q. Now, I wish you would please describe for us these lines in greater detail than you have heretofore given. I would like to know, for instance, the size of pipe and the points from which and to which these lines are to run and, also, I would like to know how far along the construction has gone for each of these looped lines.

A. All right.

* * * * * * *

[fol. 5959] Q. Mr. Burnham, there is a pending question with respect to the item shown in Line 2 of Exhibit 47, "Additions to Main Lines" in the year 1941.

That question asked you to give a description of the various additions included within that description.

A. Do you wish for me to refer to the map in making that description?

Q. Yes, please refer to map, Exhibit No. 15.

A. I believe it is already in the record that the minute that the budgets were approved covering the additions to main line last summer, immediate steps were taken in the way of ordering pipe and preparations were made to let contracts.

Notwithstanding the fact that the orders for pipe were placed rather early in the year, considerable difficulty was encountered in the way of obtaining delivery and, at last, application for a priority number was made to the O. P. M. [fol. 5960] It was granted early in the fall but too late to permit the completion of these loops which were contemplated.

The work is now in progress and to review briefly I will describe the work as it was originally contemplated and then follow with the description of the status, its present status.

Q. Very well, you may proceed with that description.

A. The only main line loop work which we proposed to do in Kansas was the construction of 10.47 miles of loop line between Haven and Olpe compressor stations.

Q. Now, you are speaking of the 1941 additions to main lines? A. Correct.

Q. What is the size of pipe on that particular loop? A. This pipe is 26-inch O. D. by 9/32 wall, manufactured by the A. O. Smith Corporation and comes in 40-foot lengths.

The work we proposed to do in Missouri was the construction of a loop line between Louisburg and Houstonia compressor stations and it consisted of 10.25 miles of 26-inch pipe of the same specifications as the loop to be built in Kansas.

Upon completion of this loop between Louisburg and Houstonia compressor stations, that would mean the completion of two lines between those two stations. In other words, it fills in the gap between the end of the present loop and Houstonia compressor station.

[fol. 5961] Between the Houstonia and Centralia compressor stations we, also, contemplated filling in that gap and it required 15.29 miles of 26-inch pipe to do that work. This, also, is A. O. Smith pipe of the same specifications as the pipe ordered for Kansas.

On the east side of the Mississippi River between Centralia compressor station and Pleasant Hill compressor station in Illinois, there are two gaps that have to be filled, one consisting of 16.37 miles between the two existing loops on the main line between these two stations and the other of 6.7 miles on the east side of the Mississippi River.

These two loops are to be constructed of 24-inch O. D. by 9/32 wall seamless pipe, which will average in length approximately 40 feet.

Between Pleasant Hill and Glenarm compressor stations there is a gap of 24.07 miles yet to be filled which we propose to fill or to construct of 24-inch by 9/32 wall seamless pipe.

Between Glenarm and Tuscola compressor stations we propose to construct 36.03 miles of 24-inch pipe which, when completed, will complete the loops between these two compressor stations.

Between Tuscola compressor station and Dana measuring station, the terminus of the line, there is a gap of 20.21 miles of line which has not yet been looped. It was [fol. 5962] proposed to complete this looping in the year 1941 under this program.

Q. What is the size of the pipe on the latter loop?
A. It is of 20-inch by .32 wall seamless pipe.

In addition to the loop lines to be constructed there is one river crossing to be reinforced and a second one to be built.

The Mississippi River crossing, as you know, now consists of a line on the Champ Clark Bridge in addition to two 12-inch submerged lines.

We propose to build two more 12-inch submerged lines in order to increase the capacity of this submerged crossing so that in the event that bridge line is lost we will have ample capacity across underneath the river.

This pipe was to be 12-3/4-inch O. D. by 3/8 wall seamless pipe.

At the Illinois River we have only one submerged crossing today and with the completion of the loops between Pleasant Hill and Glenarm station the need for a second river crossing at the Illinois River is obvious.

It will be constructed of four 12-3/4-inch O. D. by 3/8 wall seamless pipe line submerged under the river and thoroughly reinforced and weighted for that purpose.

That, in general, constitutes a description of the work as we originally proposed to do it.

Now, the status of the work I can outline briefly as follows—

[5963] Q. (Interposing) Before you give us the status of the work, will you please state whether or not all of these 1941 main-line additions which you have described are shown on the map, Exhibit No. 15, by a dotted purple line?

A. Yes, they are shown by the dotted purple line paralleling the present main line, except in the case of the Mississippi River crossing where it was impossible to

indicate the two submerged lines which we propose to build there.

Q. Is that line shown on the map? I am referring to the looping in Kansas. A. Yes.

Q. Now, will you please give us the status of the work and I would, also, like to have a breakdown in dollars for each of the items which you have named which go to make up the total of $4,292,500, as you go along.

A. The loop line in Kansas is commonly referred to as our Haven loop. It is at present under construction. The labor contract was let some weeks ago to the C. F. Foreman Construction Company, a very reliable firm in Kansas City which has been building lines for other pipe-line companies for a number of years.

The pipe has been received and has been strung. The ditching is progressing slowly and, as a result, only two or three miles of pipe have been laid to date.

Mr. Culton: The weather has been cold out there this [fol. 5964] month, has it not?

The Witness: Yes, and I might add, further to complicate the situation the contractor has found the ground underlaid with rock and he is having to shoot practically every foot of the ditch.

The work was further delayed due to the holidays coming in there, it being very difficult to get men to come out over Christmas and New Year's.

With good luck this line should be completed within the next two weeks, in which event our own forces, that is forces of Panhandle Eastern Pipe Line Company, will proceed to tie in the end of this loop to the connections on the cross-over valve at its terminus, in which event we can put it into immediate operation.

The need for that construction was apparent last week during our heavy load and we are extremely anxious to get that loop tied in before the next cold weather arrives.

The total amount of dollars involved in the constructing of this loop is $338,472.

Mr. Culton: Is that the original estimate?

The Witness: That was the revised estimate.

Mr. Culton: How does that compare with the estimate which was used in arriving at the total of $4,292,500 in Exhibit 47?

The Witness: That is the amount used in arriving at $4,292,546.

[fol. 5965] By Mr. Littman:

Q. May I have that figure, $338,000—

A. (Interposing)—472.

Q. 472. Thank you.

Now, will you please proceed with your statement of the status of the work on the loops in Missouri that had originally been intended to be completed in 1941?

I am taking them in the same order that you gave them a moment ago, Mr. Burnham.

A. I hadn't quite finished with the testimony in regard to the last loop.

There has been a further revision of that estimate and it is somewhat in the other direction, you might say, that is, our last revision of that estimate of that cost is $326,740.

Are you interested, Mr. Littman, in the revisions that we only recently have made, or do you want me to adhere to the column that adds up to the $4,292,000 figure?

Q. I would like to have both figures wherever there has been a deviation or revision of the orjginal figure submitted. I think it would be well for you to give the new estimate. Now, the new estimate here is $326,000—

A. (Interposing)—740.

Q. 740.

A. The next loop, proceeding eastward, is the loop [fol. 5966] which we commonly refer to as the Louisburg loop. It lies near the Houstonia compressor station. The pipe has been received and has been strung. The contractor is the C. F. Foreman Construction Company. There has been no work done other than stringing the pipe on this loop.

Of course, involved in that is the cutting of fences and doing of certain right-of-way work which permits the

trucks to enter the far as and so forth in order to unload the pipe.

The cost of this item was—may I go back to the Haven loop and give the original budgeted amount reflected there?

Q. Yes.

A. The original budgeted amounted amount was $284,000.

Mr. Wheat: I wish you would give both the other figures, too, right at this time.

The Witness: The first revision of the original budgeted amount was $338,472. I am talking now with respect to the Haven loop.

The second is $326,740.

By Mr. Littman:

Q. And it is the $338,472 figure which is reflected in Exhibit 47? A. That is correct.

In the case of the Louisburg loop the original budgeted amount was $278,000. The first revision which is incor- [fol. 5967] porated in Exhibit 47 or the effect of which is incorporated in Exhibit 47 is $316,047 and our latest revision of $301,900.

The status of the Houstonia loop, I think, is what you are interested in now.

Q. Yes, that is the 10-¼ miles of pipe?

A. That is correct. The pipe is now arriving on the job for that loop. Incidentally, it would be of interest to you to know that it comes in in quantities of as much as 70 or 80 carloads at a time making it very difficult for the contractor to unload and string it and release the freight cars as promptly as the railroads might wish it to be done, but they are making very good progress in getting this pipe unloaded and I hope they will be able to keep the railroad satisfied as to our efforts to release these cars as soon as possible.

The original budgeted amount on the Houstonia loop was $453,000. The first revision, the effect of which was reflected in Exhibit 47, was $440,563.

The second revision is $453,810.

Mr. Culton: There is an increase in that?

The Witness: Of $810.

Mr. Culton: I have $440,000 as against $453,000.

The Witness: That is correct, but I mean over the original budget.

Mr. Culton: I am talking about those reflected in the [fol. 5968] exhibit. There is an increase of about $13,000.

The Witness: In that case, yes.

In the Centralia loop, pipe has been shipped and, no doubt, by today some of it has been received.

You understand that all of this pipe has been made. We had word of that last week, that all of it had been turned out the mill.

The original budgeted amount for the Centralia loop was $609,000. The first revision, the effect of which was reflected in Exhibit 47, was $632,039 and the second revision is $626,150.

By Mr. Littman:

Q. Now before you proceed to the next loop line, I wish you would state when you expect these loops to be completed. You gave the date for the first loop which was the Haven loop in Kansas; but you have not stated that fact for the other loops.

A. Well, it entirely depends upon the elements. With good luck, as I said before, the contractor should be able to finish the Haven loop within the next two weeks.

Now, his contract requires that he finish that loop this winter because, as I stated before, we need it badly. If the weather is bad, if the going is too rough he does not have to complete the other loops in Missouri until in the summer.

These contractors can build these loops much cheaper in [fol. 5969] good weather, naturally, than they can in bad weather. For that reason I wouldn't be able to give a very accurate date as to when the other loops will be completed, but I should say that by early summer the other loops will be completed.

Q. And in service?

A. And in service. We will put them in service immediately upon completion.

Q. Now, does that complete your description of the loops in Missouri? A. Yes, it does.

Q. And now you are going to the loops in Illinois?

A. I wanted to make this one remark, though, in connection with this work, that the contractor has assured us that he proposes to work all winter on the Louisburg loop, assuming, of course, that he finishes the Haven loop within the next few weeks.

With that in mind he has placed this pipe in the Louisburg loop on skids to keep it up out of the mud. For that operation we had to pay him a little extra reimbursement.

The first work that we proposed to do in Illinois, that is proceeding eastward from Missouri, is the two 12-inch lines under the Mississippi River. If you don't mind I will talk about them first.

Q. Very well.

[fol. 5970] A. That pipe has been received and is stacked at the nearest railroad siding. The labor contract was let, I believe, last week; if not last week, it was the week before.

The contractor is arranging for dredges to be moved in there immediately and it is proposed to do this work during the winter when dredges are available.

There is evidence that dredges will be at a considerable premium during this coming spring and summer and we thought it wise and agreed with the contractor that he could probably secure the services of a dredging company cheaper during this weather or during the winter than he could later in the year.

It will also interest you to know that the first set of bids on this work were rejected. Some three or four weeks ago they were received and we felt that the proposed prices were much too high.

We rejected all the bids and advertised the work again and these later bids were seemingly the best prices that

we could get and they did reflect some reduction over the first set.

The original budgeted amount of the work to be done on the Mississippi River was $99,000. The first revision, the effect of which was incorporated in Exhibit 47, was $141,477.

The second revision which incorporates the new prices at which this contract has been let is $170,870.

Mr. Culton: In other words, you had to pay nearly twice [fol. 5971] as much for it as the conditions which you had in mind when your original estimate was made would have necessitated?

The Witness: That is true.

By Mr. Littman:

Q. It amounts to $31,000 more, approximately, than the amount reflected in Exhibit 47?

A. That is correct.

Mr. Culton: I had reference to when they were originally contemplated it was only $99,000 and that had to be increased nearly $80,000.

The Witness: The pipe for the Pleasant Hill loop, I believe, has been shipped. This pipe has to be stored along the right-of-way—

Mr. Culton: That is along the general area where the line is going to run?

The Witness: Correct.

(Continuing)—For the reason that our contractor who is building the lines in Illinois has his hands full over here with a long loop between Glenarm and Tuscola and he has indicated to us that he does not propose to work through the winter on account of extremely high costs involved in conducting this work in the winter, so we have agreed that he can store the pipe for the Pleasant Hill loop.

However, we are insisting, though, that he complete a certain section of the Glenarm group which I shall refer to [fol. 5972] later.

By Mr. Littman:

Q. By the way, will you please state when you expect the Mississippi River work to be done?

A. The Mississippi River work will be completed in 60 days.

Q. All right, will you proceed with your description of the Pleasant Hill station?

A. The originally budgeted amount on the Pleasant Hill loop was $725,000. The first revision, the effect of which was incorporated in Exhibit 47, was $808,695 and the last revision is $775,420.

Q. Here is one instance where your latest estimate is approximately $33,000 below the amount reflected in Exhibit 47?

A. That is correct. We expect the Pleasant Hill loop to be completed sometime in the early summer.

Now, the Illinois River crossing to be constructed lies between Pleasant Hill and Glenarm compressor stations and I shall refer to it now with your permission

Q. Yes, sir.

A. This consists of a completely new river crossing, as I said before four 12-inch lines are to be built across this river?

Q. Four 12-inch lines?

A. That is correct.

[fol. 5973] Q. Will they all be submerged river crossings?

A. Correct, so that in the event that our original crossing should either be lost or require some maintenance work on it, we will be able to utilize this new crossing to full advantage and maintain service to the east.

The original budgeted amount for the Illinois River crossing was $101,000. The revised amount, the effect of which was reflected in Exhibit 47, is $140,863 and the last revision which was made after the contract was let is $167,160.

Q. That is approximately $27,000 in excess of the amount reflected in Exhibit 47 for that particular item?

A. That is correct.

Q. When do you expect to complete the work on the Illinois River crossing?

A. That work on the Illinois River will not be finished until some time after the Mississippi River crossing has been completed. I should say that within 90 days from date the Illinois River crossing will be completed.

Q. You have purchased all of the materials required?

A. I forgot to add the pipe is on hand and the situation is similar to that at the Mississippi River crossing with respect to materials.

The next loop is the Glenarm loop which lies between Glenarm and Tuscola compressor stations and where our [fol. 5974] contractor is now engaged.

This contractor is the J. C. Truman Company and has the contract for doing all the work in Illinois with the exception of the river crossings.

The contractor moved into this job shortly before Christmas and was busily engaged in getting started from the Tuscola end of the loop toward the Glenarm end when this extremely cold weather of the recent few weeks set in.

Last week I was informed that the ditch that he had dug was filled with ice and that it would be impossible for him to work until the weather had moderated to the extent that he could get the ice out of the ditch.

This land, as I have stated before, is rather flat land and heavily tiled and the tiles were running with water at the advent of the cold weather. The result was that the ditch froze full of ice from the bottom up as the water came into the ditch, so it is a solid block of ice.

Mr. Culton: How deep is that ditch?

The Witness: About 4 feet.

He had a force of some 175 to 200 men on the job when the bad weather set in and, of course, he has been forced to lay off a majority of these men for the time being.

With good weather he will get started this week and while we are not required to complete the loop this winter we are requiring and specifying in his contract, insisting [fol. 5975] that he build not less than 12 miles of line as soon as possible.

By Mr. Littman:

Q. This is the 24-mile loop or is it the 36-mile loop?

A. The 36-mile loop between Glenarm and Tuscola.

We have insisted that the 12-mile loop be constructed as early as possible because we need that capacity this winter or we believe we will need it this winter.

The evidence to that end was quite apparent last week when Tuscola station was handling all of the gas that it could possibly handle under the circumstances that then existed.

When the contractor has finished the twelve miles, he can either proceed with his construction on westward or he can sit down until the advent of good weather in the spring. We are leaving that more or less up to him, however; all of the pipe in the Glenarm loop has been placed on skids to keep it up out of the mud in the event that he wants to proceed on westward when he has completed the 12 miles.

I would say that with good weather he will complete the Glenarm loop within 60 days from now. With bad weather he will not complete it until sometime in the early summer.

The J. C. Truman Company has, also, the contract for the Tuscola loop.

Mr. Culton: Will you give us the two prices on that section?

The Witness: I beg your pardon. The original budgeted [fol. 5976] amount for the Glenarm loop is $951,000. The first revision was $990,987, the effect of which was reflected in Exhibit 47.

Our latest revision is $1,980,000.

Mr. Culton: $1,980,000.

The Witness: That is right—no, $1,000,980.

The next loop is the Tuscola loop and I started to describe the status of that work.

By Mr. Littman:

Q. Now, this one is the 20.21 miles of 20-inch pipe, is it not?

A. That is correct. As I stated before, the pipe is strung, is on the ground and when the contractor can get to it he will move back to Tuscola and complete that, probably not until the early part of the summer.

The original budget for Tuscola loop is $443,000, the first revision, which is reflected in Exhibit 47, was $483,433 and our most recent revision is $489,780.

The total amount which corresponds to the most recent revision as compared to the $4,292,500 is $4,312,800.

Mr. Culton: In other words, you are only about $20,000 more than your estimate which you testified to in connection with '47?

The Witness: That is correct.

Mr. Culton: On a 4-¼-million dollar expenditure?

[fol. 5977] The Witness: That is correct.

By Mr. Littman:

Q. Have you completed your description of the additions to main lines for the year 1941, Mr. Burnham?

A. Well, that is the description of the work that we proposed to do in 1941, those additions. Of course, as I have indicated, it now carries over into '42.

Q. Of course none of this work was actually completed in the year 1941 but all of it is now in process of construction, is it not?

A. There were some small items which were completed. I refer to them as small. They cost, maybe, $10,000 or $15,000 and it involved preparing each of the compressor stations at Olpe, Houstonia and Centralia to receive these loops as they came into those stations.

Q. But none of that was in service?

A. No, we could not put it in service until the loop was completed, but that was a rather important piece of work. Incidentally, I forgot to tell you that it was executed by another contractor and under the same budget.

Q. Now, will you please explain how much additional capacity will be available by reason of the installation of the loop lines which you have described and which are included in the item on Line 2 of Exhibit 47?

A. That involves the use of storage, supplying gas in [fol. 5978] storage for the capacity increase.

Mr. Goodman: What storage?

The Witness: Line storage. As you can readily see, on a continuous-flow basis we have not affected the capacity between Liberal and Greensburg, nor have we affected the capacity between Greensburg and Haven nor between Olpe and Louisburg.

By Mr. Littman:

Q. Those are contemplated to be installed in years subsequent to 1941?

A. That is correct. So on a continuous-flow basis I think it can be stated that we would not have increased the capacity of the system by the construction of the loops which I have just described, however, by taking advantage of the additional storage capacity of these loops and by packing our system during off-peak periods, particularly the east end of our system, the capacity over short periods of time could be and can be materially increased.

Q. Can you give us the figures?

A. We have various estimates, but I should say that we can pack in there some 75 million to 90 million cubic feet of gas which can be made available in not less than three days.

In other words, we don't have compressor capacity to pump it out in any quicker time than three days. For [fol. 5979] instance, if there were 75 million feet of extra storage provided there, for three days' time we could pump an extra 25 million cubic feet per day.

Then we would level off at our continuous-flow capacity.

Mr. Goodman: What was that total figure, again, please?

The Witness: From 75 million to 90 million.

Mr. Cultor. In other words, you could furnish for three days additional peak capacity of 25 million a day?

The Witness: That is correct.

Now, if the peak period extended over a number of days exceeding three, why, you would be out of luck. Our experience last week indicated that these peak periods can extend over a period of time greater than three days.

We had a very heavy drag for six days.

By Mr. Littman:

Q. If you will, state why these particular points were selected by you for looping rather than other places that are available for looping?

A. As a matter of fact, east of Louisburg station there are no other places that are desirable for looping.

Q. I am referring particularly to Illinois and Missouri.

Q. I don't need to tell you the advantage of having two lines to any market. That is the reason we selected these points because they complete these loops and give us two excellent lines from Louisburg station to Dana.

[fol. 5980] That is the primary reason. At the same time we will gain capacity which, upon the completion of the loops in Kansas, will be available even on a continuous basis.

Q. I am sorry, I misspoke myself. I had the situation turned around. I meant to say when you will have completed all of your so-called 1941 construction early in the year 1942, you will then have a completely looped system through the States of Missouri and Illinois. Is that correct?

A. That is correct.

Q. But not in so far as Kansas is concerned?

A. That is correct.

Q. Now, I am wondering why you had selected that particular point in Kansas for looping that short loop that you contemplate completing this year.

A. I believe, as I stated this morning, during peak periods on our system, we observe carefully the operating characteristics of the various parts of our facilities and our observations have been that the Olpe compressor station has had a greater load to carry, that is, its suction pressure was lower than other stations in Kansas.

If you will note, too, the gap between the end of the last completed loop in Kansas and Olpe station is much greater than the gap between our last completed loops in other sections of our transmission system, for instance between Liberal and Greensburg, between Greensburg and Haven [fol. 5981] and between Olpe and Louisburg.

As I was saying, the gap between the end of the loop of the last-built Haven loop and Olpe station is much greater and that would explain the fact that Olpe was starving, you might say, for gas or for suction you might call it more accurately.

Mr. Culton: You have a bottleneck I think you said on direct examination.

The Witness: We have a very slight bottleneck. We knew that we would eventually fill these loops. We knew, too, that we could get some relief for the winter of '41-'42 if we could get that 10 miles completed before the advent of cold weather.

Incidentally, we guessed wrong because cold weather overtook us before we could get it built, but, nevertheless, we may have it completed before the next cold spell this winter, in which event we will be in somewhat better shape at Olpe station to carry our peak load.

By Mr. Littman:

Q. Now, the next item on your 1941 list of capital additions in Exhibit 47 is shown in Line 3 as "Additions to Compressor Stations" in the amount of $344,100. Is that correct?

A. That is correct.

Q. Now, when you testified here last October I believe [fol. 5982] you stated that this covers the addition of a compressor unit in each of the Illinois compressor stations, namely, Tuscola, Glenarm and Pleasant Hill. Is that correct?

A. That is correct.

Q. And you, also, testified that the work at Tuscola and Glenarm is 80 percent completed and that the work at Pleasant Hill was 60 percent completed. Is that correct?

A. That is correct.

Q. Now, will you bring us up to date on the construction in those compressor stations?

A. The work on all three stations is for all practical purposes completed.

Q. And is it in service?

A. It is in service.

Q. When did it go into service?

A. The Tuscola engine has been in service, I should say, about 30 days. That is the new engine at Tuscola.

The new engine at Glenarm was first put in service approximately two weeks ago and during the extremely cold spell last week we put the new engine at Pleasant Hill in service.

It was indeed fortunate that we had those three engines to place in service.

Q. You had them installed just in time?

A. Just in time.

Q. Now, will you state the additional horsepower at [fol. 5983] each station?

A. The horsepower of the engine at Tuscola is 600, the new engine.

At Glenarm it is 1,000 and at Pleasant Hill it is 1300.

Mr. Culton: How does $344,100 compare on the final estimate?

The Witness: We have attempted to make no revision, but we feel it is approximately the right figure to use.

Mr. Culton: In other words, work was pretty well along when you made your Exhibit 47?

The Witness: That is correct.

By Mr. Littman:

Q. Now, on the next item which you show in Exhibit 47 for the year 1941, Line 4, "South Michigan North Line" in the amount of $3,893,300, will you please state what progress has been made in the construction of that Line?

Now, before you do that, will you please give us a brief description of that line and state how it is shown in the map, Exhibit 15?

A. It is shown in purple dots on Exhibit 15 as originating here on the Michigan Gas Transmission system just inside the Michigan State line.

It is to be built from that point to the point of junction just west of Ann Arbor. It is to be built of 20-inch seamless pipe. From this point of junction—

Q. (Interposing) Will you give us the mileage of the [fol. 5984] 20-inch pipe?

A. Inasmuch as the surveys on this line were completed since I last testified here, I can give you the revised mileages involved.

Q. Yes, that would be best, to have the latest figures.

A. As I stated before, the system originates on the Michigan Gas Transmission system just inside the Michigan State line and the first section is to be built of 20-inch seamless pipe for a distance of 31.1 miles to a point of junction east of Ann Arbor, Michigan.

Q. Now, that section runs due north, does it not?

A. Not quite due north, slightly to the west, northwest.

Mr. Culton: It so shows on the map, does it not?

The Witness: Yes, as the map indicates.

From the point of junction the north line, as we refer to it, proceeds in a northeasterly direction for a distance of 30.25 miles to a point southwest of Pontiac.

This section is to be built of 18-inch seamless pipe. The north line then proceeds almost due north for a distance of 33¾ miles to a point northeast of Flint, Michigan.

By Mr. Littman:

Q. What is the size of the pipe in that section?

A. Which section is to be built of 16-inch seamless [fol. 5985] pipe.

From this point the north line proceeds in a northwesterly direction to its terminus west of Zilwaukee. This latter section is to be built of 12-inch seamless pipe. There is a branch line to be built—

Q. (Interposing) What is the mileage on that last section?

A. I beg your pardon. 41 miles.

Q. That is 41 miles from the terminus to the junction southwest of Pontiac?

A. No, it is 41 miles from the terminus of the 16-inch line at a point northeast of Flint to the terminus of the system.

Q. Are you going to talk about the lateral line?

A. Yes.

Q. We will pick that up later.

A. It is still considered part of the north line, I am pretty sure.

Q. I wanted to state that we are going to speak about the Adrian lateral later, but if you have another section of the north line in mind, why, you better go ahead with it.

A. Another section of the north line is that part which runs over to a point south of Pontiac. It consists of 20.73 miles of 12-inch seamless pipe.

Mr. Littman: May I have the last answer, please?

[fol. 5986] (Whereupon, the last answer was read by the reporter.)

The Witness: I believe that completes the description of the north line.

Mr. Culton: Why not endeavor to define the north line to us? Just tell us what point it runs from and the terminus so there will be no question in the record about it. That is later referred to as the "west line".

Mr. Wheat: You say the south Michigan north line and south Michigan west line. I think that is what Mr. Culton referred to.

Mr. Littman: He is going into the south Michigan west line a little later.

Mr. Culton: We just thought that whoever reads the record might, at this time, get the distinction between the west line and the north line.

The Witness: The north line originates on the Michigan Gas Transmission Corporation system and terminates at a point 8 miles west of Zilwaukee. It, also, has another terminus at Clawson which is a point south of Pontiac.

Mr. Culton: And what is the west line?

The Witness: The west line originates at the junction between the 20-inch and 18-inch pipe.

Mr. Culton: On the north line and proceeds westerly to Battle Creek and Kalamazoo. That clears it up, I hope.

By Mr. Littman:

[fol. 5987] Q. Now, will you please state what progress has been made in connection with the construction of the south Michigan north line to date?

A. All pipe, with the exception of a 16- and 18-inch, has been received. The 20-inch has been stacked at points near the right-of-way.

I forgot to add that the right-of-way has been purchased complete. The 12-inch which extends from Flint to the terminus, to the northern terminus of the line has been received and strung and the contractor is now engaged in laying it.

He is working from the northern terminus south. He has laid some 5 or 6 miles completed. He has welded some 20 to 25 miles. This contractor is, by name, I. C. Little and Company. I. C. Little and Company has also been delayed by the advent of the extremely cold weather, however, he is making every effort to complete this some 40 miles of 12-inch into Flint at the earliest possible date, at which time he may elect to continue construction of other lines in the general area.

Q. What seems to be the difficulty with the 16- and 18-inch pipe?

A. There is no difficulty, it is merely a matter of routine operations in so far as the mill is concerned until we will begin to get the 16-and 18-inch pipe.

Q. It has been ordered, of course?

[fol. 5988] A. Oh, yes.

Q. And when do you expect delivery?

A. We expect delivery on the 16- and 18-inch pipe to commence not later than the first of February. The situation is something like this:

The same mill rolled 12-inch that rolled 20-inch. It also rolled 20-inch for the Tuscola loop. It also rolled 24-inch for the other loops in Illinois.

Q. What is the name of that company?

A. National Tube Company. They scheduled their operations in such a way as to take care of our requirements for this coming winter's load.

In other words, we were very eager to get some 24-inch between Glenarm and Tuscola stations, therefore, we told them to roll a 24-inch early in their program. Also, we wanted this 20-inch. This 20-inch here, referring particularly to the 20-inch in Michigan.

The mill said, "Very well, after we finish your 12-inch"—of course we elected to take it first—"We will roll the 20-inch, then the 24 and, having completed all of that, we will then go back and roll the 16 and 18."

Now, they have, according to the latest word we have received from them, completed the 24-inch which was the last to be rolled previous to the 16 and 18, but they advised us that due to certain priorities that had come in, [fol. 5989] the 16- and 18-inch would not be forthcoming for some two weeks.

Q. Am I correct in understanding that all of your rights-of-way had been secured for this south Michigan north line?

A. Well, maybe I was a little optimistic when I stated that. There are, possibly, a few pieces on the lateral line running over to Pontiac not yet in, but everything is completed except that possibility.

Q. And the contracts have all been placed?

A. The contract for all the lines in Michigan, I mean all the lines involved in the north line have been let.

Q. And when do you expect in the ordinary course of events to have completed this south Michigan north line and have it in service?

A. We expect to have it in service, I should say, not later than the first of June.

Q. Now, this line is being built to serve the Consumers Power Company under the Consumers Power contract, is it not?

A. That, in addition to other distribution centers. Adrian, as you mentioned a while ago, was involved, Battle Creek, also, will be served indirectly through this north line.

Q. Has Panhandle Eastern entered into contracts for the serving of those communities that you just named?

A. Yes.

Q. Now, the next item—

[fol. 5990] Mr. Culton: (Interposing) Suppose we check the last estimate on the cost of that line.

The Witness: The revised estimate for the southern Michigan north line, the effect of which was incorporated in Exhibit 47, was $3,893,300 and our last revision is $3,424,900.

[fol. 5991] By Mr. Littman:

Q. Mr. Burnham, suppose we take up the next item, which is shown in Line 5 of Exhibit 47 for the year 1941, "Lateral Lines" in the total amount of $463,800.

Now, if I correctly recall your direct testimony, you stated that the first of these lateral lines was a lateral running to Galesburg, Illinois, which was estimated to cost $291,500.

Will you please give us the length of that lateral line and the size of the pipe used?

A. The Galesburg line consists of 42 miles of 8-inch pipe extending from a point near Bartonville, Illinois, to the south city limits of Galesburg.

Q. Now, is that line shown on the map, Exhibit No. 15?

A. Yes, in purple dots. In addition to this lateral line to Galesburg proper, is the branch line to Abingdon.

Q. Before going to the Abingdon lateral, Mr. Burnham, am I correct in understanding that the Galesburg lateral involves the lifting of the Mildred, Kansas, lateral to which you referred in your direct testimony and involved the purchase of sufficient additional 8-inch pipe to complete the 42 miles involved?

A. That is correct.

Q. Now, will you state what progress has been made in [fol. 5992] connection with that work?

A. The Mildred line has been lifted and the majority of the pipe lifted from the Mildred line has been received and strung on the Galesburg line.

The balance of the Mildred pipe will be shipped this week.

Q. How much will be shipped?

A. I think there remains about 8 miles to be shipped of the Mildred pipe. The new pipe required to complete the line to Galesburg has been received and is strung on the Galesburg lateral.

Q. What do you say about the original estimate reflected in Exhibit 47 on account of that lateral in the amount of $291,500?

A. That estimate involved cash expenditures only, that is, I took the cash required to lift the Mildred lateral, added to it the cash required in the purchase of new pipe and added to those two items the cash involved in the labor contract to lay the line to Galesburg.

Q. Have you made any revision of that original estimate?

A. I have not available the revision that has been made but my papers here indicate that a revision has been made which is reflected in my total only on Line 5.

If the Commission would require it, I shall be glad to furnish the details at a later date.

Q. You expect to give us the revised estimate for the [fol. 5993] total shown in Line 5 of Exhibit 47, do you?

A. That is correct.

. . . . . .

Q. Now, when do you expect to complete the Galesburg lateral?

A. The contractor is working there when weather permits. He is encountering unusual difficulties due to the extremely cold weather and the depth of the frost.

Like the other two contractors now engaged on our main-line system, he too had to shut down over the holidays and particularly during this very bitter weather that we experienced last week. However, he has assured us and we are working on the assumption that his assurance is worth something that the minute that the weather permits, he will proceed with the work.

He is, nevertheless, proceeding with the stringing of the balance of the pipe to be shipped from Mildred, Kansas. The weather permitting, the Galesburg lateral should be completed by late spring.

That does not involve the line down to Abingdon, which line is to be built by the same contractor, nor the line to Knoxville.

[fol. 5994] Q. I was going to take those up one at a time.

Let's go to the second lateral included in these 1941 lateral lines, to wit, the Abingdon, Illinois, lateral. Will you give us a description of that line?

A. The Abingdon lateral originates on the Galesburg lateral and proceeds in the direction as shown on the map southwest for a distance of about 8 miles and consists of a 4-inch line.

It is being built principally to serve the Abingdon pottery or ceramic works there, which is engaged in making products used in the Army camps and has a direct connection to the war program, as I understand it.

The 4-inch line down to Abingdon will be built after the completion of the 8-inch line to Galesburg. The pipe is on hand, I am glad to state, and will be ready whenever the line is completed into Galesburg.

Q. Now, have you purchased all of your rights-of-way?

A. Yes, all rights-of-way on the Galesburg-Abingdon-Knoxville system are complete.

Q. And the contracts have all been let?

A. The contract has been let. It is one contract.

Q. When do you anticipate putting the Abingdon line in service?

A. It will be put in service immediately upon the completion of the construction, which construction, as I stated [fol. 5995] before, will follow the completion of the Galesburg lateral, so that would probably make it early summer before the service is rendered in Abingdon.

* * * * * * * *

Q. Your estimate of the Abingdon line was $38,500. Can you state the amount of the revision, if any, since you gave that testimony, or is that also going to be included in your total?

A. That will be included in the total.

Q. But the figure of $38,500 is correct, is it not?

A. That is correct.

Q. Now, your third lateral is called the Knoxville, Illinois, lateral, which entails a small amount, to-wit, $2,600; does it not?

A. That lateral consists of only one-half mile of 2-inch pipe and similar to the Abingdon lateral, it originates on the Galesburg line.

It is not shown on the map, being such a short line, but Knoxville is due east of Galesburg and a small community which we propose to serve with natural gas at the same time that that service is rendered in Galesburg.

The construction of that half-mile of 2-inch line does not involve a great amount of work and will be completed [fol. 5996] shortly after the line is completed into Galesburg, which will be late spring or early summer.

Q. Now, the fourth lateral included in the year 1941 is the Greenfield, Indiana, lateral which you estimated to cost $83,300.

Can you give us the details on that?

A. The Greenfield, Indiana, lateral has been completed and was put in service on January 2. Incidentally, it was placed in service at a time which was most fortunate for the residents of Greenfield.

Greenfield, as you know, has been dependent upon a rather inadequate supply of gas for some considerable time and on the night of January 1 when the cold weather descended upon that area, the boiler at Greenfield gas plant blew up and while we had not put the last finishing touches on the Greenfield lateral line, nevertheless, we were able to turn the gas into the gas holder the following morning and by that means we were able to keep the people in Greenfield, Indiana, in service.

. . . . . .

Mr. Goodman: May I ask a question there. Was Greenfield served by manufactured gas?

The Witness: I think I testified here in the previous [fol. 5997] testimony that it was served with manufactured gas and I was wrong in that respect.

It was a local supply of natural gas. I would like to correct my testimony in that respect.

By Mr. Littman:

Q. Will you give us a brief description of that line, to-wit, the Greenfield, Indiana, lateral?

A. The Greenfield, Indiana, lateral originates on the Michigan Gas Transmission system at a point east of Indianapolis and consists of approximately 17 miles of 4-inch pipe which was solid-welded and was laid during the months of November and December.

Q. 1941? A. 1941.

Q. Now, that leaves the last of the lateral lines for the year 1941, namely, the Adrian, Michigan, lateral. Will you give us a description of that lateral line and the status of its construction?

A. The Adrian, Michigan, lateral line is not shown on Exhibit 15 but originates on the 20-inch Southern Michigan north line at a point about midway between the June-[fol. 5998] tion with the Michigan Gas Transmission Corporation's line and the junction of the 16- and 18-inch line near Ann Arbor.

The Adrian lateral consists of 7 miles of 4-inch pipe and will be solid-welded. The pipe is at present in stock. That is, it has been received and is stacked near the right-of-way.

The right-of-way has been secured and while the contract has not been let, it is expected that before the 20-inch line is completed, we will let a contract for the construction of the later line to Adrian and work will be commenced on it forthwith.

We anticipate that it will probably be early summer before the Adrian lateral is completed.

Q. Now, you testified in direct examination that the estimated cost of the Adrian, Michigan, lateral, would be $47,914; did you not?

A. That is correct.

Q. Are you prepared to state whether there have been any changes in the estimate for the lateral lines for 1941

which are included in your Exhibit 47 as shown in Line 5 as $463,800?

A. Yes, I am prepared to state that while the original budget called for $463,800 for these lateral lines and the estimate which was incorporated in Exhibit 47 was in the same amount, we have now revised that figure to $522,700.

. . . . . .

[fol. 5999] Mr. Goodman: Does that revision consist simply of cost changes or does it include any figure for additional laterals?

The Witness: It consists entirely of cost changes.

. . . . . .

Q. Now, Mr. Burnham, would you please give us your revised estimates for the year 1941 which are shown in items from Lines 2 to 5, inclusive, of Exhibit 47?

Perhaps it would be well to recapitulate the five items shown there.

A. All right. For Line 2 on Exhibit 47, my revised total now is $4,312,810;

For Line 3, there is no change, that being $344,100;

Line 4, $3,424,900;

Line 5, $522,700 and if I have added them correctly, the total for Line 6 will be $8,604,510.

. . . . . .

[fol. 6000] The Witness: My first revision was involved in a substantial increase in the cost of all pipe and that was reflected in Exhibit 47.

This last revision has to do with labor costs, primarily.

Mr. Mc Ree. May I ask, Mr. Burnham, did the fact that a larger portion of this work is being done in cold weather affect the costs there?

The Witness: It did, to this extent, for instance, the "skidding" of the pipe to keep it out of the mud and other items like that.

Early in the fall when we originally negotiated these contracts, the contractors did tell us that they would

have to have more money if the work was pursued through the winter. We finally said to them: "Well now, if you will build just a limited number of miles of pipe here and then let it go until spring or until good weather returns, we do not believe you re warranted in asking these increased prices" and we negotiated the contracts on that basis, that is, no increase due to winter construction but we were to keep down our requirements as to the minimum amount of pipe they would lay before the shut-down period.

Now, that pertains to the main-line contractors and to the contractor in Michigan. On the Galesburg line, we [fol. 6001] did reimburse the contractor some extra for working all winter long up there on that lateral and that is probably reflected in the revision that I just gave.

Mr. Mc Ree: You have pressed the contractors a bit more to get the work finished than you anticipated, haven't you?

The Witness: Those particular sections that I mentioned a while ago that were critical in respect to our main lines.

Mr. Mc Ree: Where the defense industries were involved?

The Witness: That is correct.

By Mr. Littman:

Q. Before leaving the 1941 capital additions, I would like to inquire how much additional capacity will have been installed on the system when all of these additions will have been made?

A. I thought I answered that this morning by stating that, in so far as continuous capacity is concerned, we have not built any additional capacity.

Q. I thought my question at that time was confined to the additions to main lines. I am now speaking of the additions to compressor stations as well.

A. The additions to those three compressor stations, by the same token, did not increase the capacity of the system on a continuous basis.

It merely meant that had we had the loops completed which we fully anticipated that we would have, those three

[fol. 6002] additional engines would have made it possible to deliver that storage out of those newly-constructed loops over a reasonable short period of time.

Q. Of about three days?

A. Of about three days as a minimum.

Q. Will you state the capacity of the system?

A. The capacity of the system before we began this work was approximately 250 million cubic feet on a sales basis.

Q. Per 24 hours?

A. Per day, that is correct. It so happened that we did serve, on the coldest day last week, 256 million cubic feet in round numbers.

Q. But you could not keep that up very long, could you?

A. The indications were that we could not keep that up day after day but, for six days, we did deliver through Dana, the estimated capacity of our system, namely, 175 million for 24 hours, which indicated that our calculations on capacity were fairly accurate and, incidentally, on those days, had we been able to carry our entire load, we would have sold very nearly Mr. Moyson's estimate for the peak day of this winter.

As I stated before, he has demonstrated an uncanny ability to estimate these peak days accurately.

Q. His estimate for the peak day in 1941 is 240,394 M.c.f., is that correct?

[fol. 6003] A. That was for the winter '40-'41. We have already experienced that peak day.

Q. Then his estimate, as shown in Exhibit 40 for the peak day of 1942, which you say is in reality the peak day for the winter of 1941-1942, is 305,200 M.c.f.?

A. Yes.

Q. Is that the figure to which you just referred?

A. That is the figure to which I just referred, and had we not interrupted our customers which we had to do in several instances and had Detroit, which is shown in that estimate as requiring 143 million—is that correct?

Q. 142 million for Detroit.

A. (Continuing) Had Detroit taken 142 million on that day which it did not due to the operation of its manufactured gas plant, had those things occurred and had we

completed our loops, we would have delivered on that day very nearly 300 million cubic feet.

Mr. Wheat: That was an exceptionally cold spell, was it not, that you had?

The Witness: That was right near the condition that Mr. Morton uses in making his estimates, a zero day, a mean temperature of zero up and down the entire system.

It was indeed fortunate, as I stated before, that we were able to shut off the few industrials that we did. However, it did have repercussions even here in Washington, as I [fol. 6004] understand.

Some of the industries were engaged in work which involved directly or indirectly materials for the Government. However, we attempted to curtail the operations of plants which affected the defense effort to the least extent.

Those plants that were capable of burning other fuels were put on to other fuels. We interrupted on our own system or curtailed on our own system something like 18 million cubic feet per 24 hours.

There were interruptions made in Indiana to the extent of 10 or 12 million cubic feet.

The situation, as I stated before, worked out very fortunately because, at the end of an eight-day period, we were able to resume operations on a 100 percent basis and, to my knowledge, no material was damaged although operations were, in some plants, slowed up to some extent.

By Mr. Littman:

Q. Now, we will go to the 1942 additions. The first item shown is in Line 8, "Additions to Main Lines—$2,526,900".

You did not, in your direct testimony, state any details with respect to that item. Will you please, therefore, give us a description of the lines that enter into that $2,526,900 total?

A. This total involves the expenditures required to complete the loops on this system and the need for which

[fol. 6005] has been demonstrated by the experience of last week's cold spell.

The loops to be built are all in Kansas and are shown on Exhibits 15 in these gaps, that is, the gap will show the loops to be built.

Mr. Culton: What color are they?

The Witness: No color. It is merely a gap in our looped system which indicates a loop to be built in our system.

By Mr. Littman:

Q. The white space will indicate the gaps on the map?

A. That is correct. The proposed Olpe loop which will lie between Olpe and Louisburg compressor station is 26.64 miles long and will be built of 26-inch pipe of the same specifications as the 10-mile loop that is under construction now west of Olpe.

The construction will be of similar nature although we do not expect to find as much rock in the construction on the Olpe loop as we do in the construction of the line west of Olpe compressor station.

The Haven loop will complete the gap between Haven and Olpe stations. Had we known that we would be delayed in getting this pipe until just recently that is now being installed in this section of our line, we would probably have pursued this construction all in one piece.

However, the pipe is not available and we will have to wait until later in the summer to get additional pipe to fill [fol. 6006] the gap.

The length to be filled, after the construction of the lines now being built, will be 15.53 miles and it will consist of 26-inch O D, 9/32 wall, A. O. Smith electric weld pipe.

The Greensburg loop to be built in this year will fill the gap between the end of the existing loop and Haven compressor station.

Q. What is the distance?

A. It is 20.19 miles long and will be built of 26-inch O D, 9/32 wall, A. O. Smith electric weld pipe.

The Liberal loop, which is the last on the list, will consist of 23.37 miles of 26-inch O-D, 9/32 wall, A. O. Smith electric weld pipe, and will complete the looping of the entire system.

In addition to the looped lines that I have just described, it will be necessary for the company to make certain changes on the suction side of each of the compressor stations in Kansas with the exception of Olpe compressor station to accommodate this new construction.

In other words, at Louisburg, Haven and Greensburg compressor stations, the company will be required to build connections and install certain necessary valves, and so forth, to make the system adaptable to these new loops.

Q. Does that complete the description of the looped [fol. 6007] lines?

A. Yes. I might say that this totals up to 85.73 miles of 26-inch pipe and, in tons, it is roughly 17,500 tons of steel.

Q. What, if anything, has been done toward constructing those lines?

A. These lines have been surveyed. The rights-of-way have been acquired, practically. In other words, quite a bit of this right-of-way work was done when the original line was built through there.

The agreements, most generally, call for a double line so the right-of-way work merely involves the computation of the reddages and so forth and the mailing of checks in payment for the right-of-way.

The drafting or engineering work has been done.

Q. Has any pipe been ordered?

A. No, no pipe has been ordered.

Q. Will you state what steps have been taken in connection with the securing of the management's approval of this work?

A. We have prepared the budgets and they are in the hands of the Budget Director.

Q. The Board of Directors has not yet approved the work?

A. No, the Board of Directors has not passed upon it.

Q. And no work orders have yet been issued, of course? [fol. 6008] A. Unless there has been a work order to cover the preliminary work, there have been no work orders issued.

Mr. Culton: By the way, have any of the 1942 budgets been finalized as yet?

The Witness: None of the 1942 budgets has been approved or examined.

If you will pardon me, there have been some slight revisions in the amounts I testified to in the last hearing.

By Mr. Littman:

Q. All right. Let's have your last revision.

A. My first estimate on the Olpe loop was $764,856.

Q. You did not read those into the record in your direct examination, did you?

A. Line 8, I will testify in regard to Line 8, then. I have revised Line 8 in the amount of $2,526,900 to $2,581,160.

Q. $2,581,160? A. Yes.

Q. Mr. Burnham, I believe when you testified on direct examination you stated that the figures shown in Column B of Exhibit 47 did not reflect increases in material and labor costs subsequent to June 30, 1941, but that they reflected materials and labor costs as of June 30, 1941, is that correct?

A. That is correct.

Q. Now, this new figure that you gave me, what does [fol. 6009] that reflect? What brings about the increase?

A. That increase was brought about by this work which I mentioned a while ago involved on the suction side of these compressor stations to accommodate these loops.

Our experience in building them this year indicates to us that these changes at the compressor stations are much more expensive than we had anticipated.

Q. Does this new amount you just gave reflect any increases in labor costs or materials?

A. Some increase in labor costs but not in materials.

Q. Well, as of what date does this estimate speak, this new estimate of $2,581,160?

Maybe that would give me the precise answer I want.

A. That is as of December 15.

Q. 1941? A. 1941.

Mr. Culton: That was about the date you prepared your budget estimate for the next year?

The Witness. We are all the time working on this, but that is the date of our last revision or very nearly the date of our last revision.

By Mr. Littman:

Q. And, of course, this sum is subject to revision, that is, either up or down, is it?

A. Indeed it is. However, unless we know that we are [fol. 6010] going to encounter expenditures greatly in excess or quite a bit under the estimated figure, why, we do not change the budget amount.

Q. Now, the next item is shown on Line 9, "Additions to Compressor Stations".

Will you briefly describe those additions in the total amount of $1,593,900?

A. The experience that we have had of building compressor station additions this summer and the experience we have had during the winter have indicated there should be a slight revision made in the total on Line 9, from $1,593,900 to $1,686,990.

That revision reflects increased cost of materials, principally. We, as you know, bought some engines last fall and we learned at that time that prices on engines had materially increased.

In fact, they had increased over any figure that we might have used on June 30, and, as a result, we are revising the estimated costs of building the additions to the compressor stations involved in Line 9.

Q. Now, will you state where these new compressor engines are to be installed and the amount of horsepower involved at each point of installation; and also please state the type and character of machines installed?

A. The total item or total amount involves the cost [fol. 6011] of installing one new 1,000 horsepower Cooper-

Bessemer direct acting gas-engine driven compressor at Glenarm compressor station;

One 1,300 horsepower Worthington unit of similar type at Pleasant Hill compressor station;

Two 1,300 horsepower units, in this case Worthington units of similar type as Centralia compressor station;

One 1,300 horsepower Cooper-Bessemer unit at Houstonia station;

Two 1,000 Cooper-Bessemer compressor units at Louisburg;

One 1,300 horsepower unit at Olpe compressor station, which is a Worthington unit;

One 1,300 horsepower unit at Haven compressor station; and

One 1,300 horsepower unit at Greensburg compressor station, a Cooper Bessemer unit.

Q. Now, will you state the amounts which go to make up the totals shown in Line 9 and which go to make up your latest revised estimate?

A. To install the 1,000 horsepower unit at Glenarm, we originally estimated it would cost $140,000. We now estimate the cost of this addition at $175,300.

To install the 1,300 horsepower unit at Pleasant Hill, we originally estimated $179,400, which estimate has been revised to date downward to $169,700.

To install the two 1,300 horsepower units at Centralia [fol. 6012] compressor station, we originally estimated $351,000, which estimate has also been revised downward to $322,650.

We originally estimated the cost of installing the unit at Houstonia at $175,500 and we now estimate it to cost $151,340.

The two units to be installed at Louisburg compressor station were originally estimated to cost $280,000 and are now estimated to cost $267,400.

The unit at Olpe compressor station was originally estimated to cost $156,000 and will now cost, according to our estimate, $171,810.

We originally estimated the cost of the unit at Haven compressor station at $156,000 and we now estimate it will cost $190,000.

We originally estimated the cost to install a unit at Greensburg compressor station at $156,000 and we now estimate it will cost $175,290.

The Liberal station, we originally estimated that we would not make any capital additions. However, we find that we are short of cooling tower capacity at this station, and we now estimate that it will require $63,500 to enlarge our cooling capacity at this station.

Q. Now, am I correct in stating that that latter item for the cooling tower was not originally included in Column B of Exhibit 47, Line 9?

[fol. 6013] A. That is correct, but it is a compressor station investment or capital requirement, the need of which has made itself evident.

Q. Now, am I correct in stating that each of the first figures that you just read into the record go to make up the total of $1,593,900 shown in Column B, Line 9 of Exhibit 47?

A. That is correct, and if I may add, the total of the last figures or the revisions, add to $1,686,990 which I gave you a little while ago.

Q. Will this cooling tower replace an old cooling tower?

A. No, it is an addition to the existing tower.

Q. Now, Mr. Burnham, has all of this equipment been ordered? A. It has not.

Q. Has any of it been ordered by the company?

A. None of it has been ordered.

Q. Do you know if any of it has been approved by the Board of Directors or the management?

A. The Board has not passed on any of these budgets.

Q. And, ordinarily, it is the practice for the Board to pass upon items such as these before any final order is placed for them, is that right?

A. That is correct.

Q. Can you state what the probabilities are that such [fol. 6014] equipment could be obtained if ordered this year, considering and having in mind the present conditions of manufacturing materials?

A. The situation is something like this:

There is no question that Panhandle Eastern must have additional capacity built this summer before it can even hope to carry next winter's peak load.

There is no question but what Panhandle Eastern Pipe Line Company serves the defense effort or, if you will, the war effort now that war is here.

We have been fortunate in the past to secure from the O. P. M. priority ratings which permit us to make extensions to our system and we have every reason to believe that priorities will be granted in the future to permit us to build the needed capacity.

The manufacturers of these engines are, it is true, involved in the production of other materials used in the war effort but, fortunately, the type of engine that we use for gas compressor work is very dissimilar to anything which might be produced for the Navy or the Army or for other industrial applications.

That would mean that we do not necessarily displace other work in the shops of these big plants and men trained and skilled in the making of these large compressor units continue the work in which they have been engaged in [fol. 6015] producing these big units.

As I stated before, we were very fortunate to get through last week's unusual cold spell as well as we did. However, it did vindicate our judgment and our computations that we have made in connection with the Panhandle Eastern Pipe Line Company's system.

In the first place, it proved that we know how to compute the capacity of our system. We have always felt that we knew how to do that anyway, but the proof like last week's experience is encouraging, nevertheless.

It also shows that our organization is able to predict very accurately the peak days, or peak demands, if you will, that will be placed on our system from time to time.

With those two things behind us, we feel certain that when we propose to the O. P. M. that certain priorities be granted to us, that we can talk with authority and with knowledge in regard to those requests.

Does that answer your question?

Q. What do you say about securing the pipe for the main lines for 1942?

A. As I testified a moment ago, there are about 17,500 tons of pipe involved. That will permit us to complete these loops through Kansas and will increase the capacity of this system more than 50 million per day on a continuous basis.

Q. You mean the installation of 1942 loops?

[fol. 6016] A. Correct.

Q. Plus the additions to compressor stations which you just described will produce that?

A. No, the addition of the loops alone. To show you how important those loops are to this system, the addition of the loops alone would increase our capacity better than 50 million cubic feet per day.

Q. And what do you say about the installation of the compressor stations?

A. The installation of the compressor station additions in conjunction with the completion of the loops will increase our capacity better than 80 million cubic feet per day.

Our figures indicate that the capacity, sales capacity, of the system will be 331 million cubic feet per day after the completion of the loops in Kansas plus the additions to compressor stations as shown on Line 9, Exhibit 47.

Q. Now, you have 250,000 M.c.f. capacity?

A. Right.

Q. And this additional 130,000 M.c.f. would give you a total capacity of 380,000 M.c.f.?

A. I am sorry, but I do not recall mentioning 130,000.

Q. I probably wrote down the wrong figure.

A. Here is what it amounts to: You will get 50 million with loops alone. You will get 81 million with loops and [fol. 6017] power. That is where the difference was.

Q. I see. The 80,000 M.c.f. is cumulative?

A. That is right.

Q. And that will give you a total of 330,000 M.c.f. capacity?

A. Correct.

Q. As of the date on which these additions that you have described have been installed?

A. Yes, more nearly 331 million.

Mr. Goodman: That is constant capacity.

The Witness: That is constant capacity.

Mr. Goodman: And that takes no account of the increase made on the 1941 or contemplated for 1941 of 75 to 90 million, three-day capacity?

The Witness: That takes no account of line storage. Now, as I have indicated before, line storage is an uncertain thing to rely upon so we much prefer and have always, in the past, based our computations and our studies on continuous capacity.

. . . . . .

[fol. 6020] C. H. M. Burnham a witness, having been previously duly sworn, resumed the stand and testified further as follows:

Cross-Examination (Continued).

By Mr. Littman:

Q. Mr. Burnham, yesterday we completed our discussion of the additions to main lines and additions to compressor stations shown in Lines 8 and 9 of Exhibit 47, which additions are shown in that exhibit for the year 1942.

We will now pass on to the next item shown in Line 10, namely, "Additions to Gasoline and Dehydration Equipment", in the amount of $120,000.

Will you give us a description of that equipment?

A. Before going on to that statement concerning Line 10, additions to gasoline and dehydration equipment, I would like to say something in respect to the main line additions that I testified to yesterday.

Q. You mean for the year 1942?

A. Yes, and for 1941. I wanted it distinctly understood that those expenditures concern only the main line

east of Liberal and I think the record will show that to be the case.

Q. Yes.

[fol. 6021] A. I mentioned certain tonnages of pipe involved. I do not include in those tonnages any pipe required for field operation.

As you can readily understand, in so far as this hearing is concerned, this witness is not trying to cover pipe and compressors required other than between Liberal and Dana, Indiana.

Q. And you do include Liberal in your estimates?

A. I do include Liberal compressor station itself.

Q. Mr. Hinton has testified with respect to the capital additions west of Liberal?

A. That is correct.

Q. And that would take in all of the gathering lines and other line additions which you state you are excluding from your testimony?

A. That is correct.

The $120,000 item shown on Line 10 as being required in the year 1942 for additions to the gasoline and dehydration equipment involves the purchase and installation of two complete absorption towers and dehydration contactors, one new boiler, the necessary pipe, valves and fittings to install this equipment, certain buildings and miscellaneous expenditures totaling $120,000.

This investment, as you know, is at our Liberal gasoline and dehydration plant.

[fol. 6022] We have not revised the estimate so it stands as I originally testified earlier this winter.

Q. What do you propose to accomplish by these additions to the gasoline and dehydration equipment?

A. As more gas is carried through the main line system, it follows that more gas is brought into Liberal compressor station. It is necessary, therefore, to increase the capacity of our gas treating plant.

This plant removes natural gasoline which would otherwise condense in the line and at the same time removes water vapor, which, if left in the gas, would give us no end of trouble, particularly during cold weather.

Q. What will be the capacity of your gasoline and dehydration plant at Liberal compressor station after the installation of these capital additions in the amount of $120,000?

A. The capacity of each absorber-contactor is approximately 40 million cubic feet per 24 hours at 500 pounds working pressure.

Therefore, the addition of two new ones will increase the capacity of this plant by some 80 million cubic feet per day. The present capacity is in the order of 273 million per day.

Q. That would bring your total capacity to 355 million cubic feet per day?

A. That is approximately correct.

Mr. Culton: That would be a peak?

* * * * * * * * *

[fol. 6023] The Witness: For peak-day operation. Yes.

By Mr. Littman:

Q. What is the type and character of this equipment?

A. It is the usual type of equipment that is used by all natural gasoline plant operators.

Q. Who manufactures this new equipment?

A. The equipment itself is made by various manufacturers. The absorber-contactor towers are built, in this case, by the Stearns-Roger Manufacturing Company of Denver, Colorado, but this type is also available from other manufacturers inasmuch as it is not a patented device.

The boiler, of course, is a water tube type boiler with brick setting. The pipe, valves and fittings are similar to those already installed in this plant.

I did not mention the fact that a great part of the equipment needs to be insulated after it is installed.

Q. Has this new equipment been ordered?

A. No, it has not.

Q. What stage has been reached in connection with this estimate?

A. We have done very little work in connection with this installation inasmuch as the engineering work, to a

[fol. 6024] great extent, involved in making this addition will be done by the contractor. It is, in fact, a more or less specialized piece of work which various contractors skilled in the art are engaged to conduct.

I will mention three firms that we do have on our list that are engaged in this kind of work. The first is the Fluor Corporation of Los Angeles, California; the second is the Stearns-Roger Manufacturing Company, Denver, Colorado; and the third is J. F. Pritchard of Kansas City, Missouri.

Q. Has any action been taken by the management or Board of Directors of Panhandle Eastern with respect to this proposed addition to the gasoline and dehydration equipment?

A. No action that I have knowledge of.

Mr. Culton: Is this a necessity, though, if additional lines are constructed so as to handle the additional gas?

The Witness: That is correct. I might add that while I have not had time to revise this estimate, our experience in the early part of this month indicated that not only is the absorber-contactor capacity going to be deficient for next winter's load but we are also faced with the necessity of increasing our distillation capacity at the same time.

As I stated before, I have not had time to go into that and no doubt certain recommendations will be made by the engineering department to the management too, at the same time, increase the distillation capacity of this plant.

[fol. 6025] As you can readily understand, we have learned a lot about our entire transmission system in the last ten or 12 days.

Q. Going to the next item, which is shown in Line 11 as "South Michigan West Line", in the amount of $1,766,000, will you give us a brief description of that line and please refer to the map, Exhibit No. 15.

A. The west line as shown on Exhibit 15 originates at the junction of the 20-inch and 18-inch north line pipes.

Mr. Wheat: You mean the south Michigan north line that you described?

The Witness: Yes, sir, and proceeds in a westerly direction to the City of Kalamazoo. For a distance of 64.5 miles, the line is to be constructed of 16-inch pipe.

This pipe will be seamless pipe and will be solid welded.

By Mr. Littman:

Q. That 16-inch pipe will run from the junction with the south Michigan north line as far as—

A. (Interposing) Battle Creek.

Q. Battle Creek, Michigan, is that correct?

A. Correct. From Battle Creek to Kalamazoo, the line is to be built of 12-inch seamless pipe, solid welded and, according to our latest survey, the distance is 19.5 miles.

We are now engaged actively in securing the rights-of-way for this line, as well as for the lateral lines connecting [fol. 6026] to the towns of Jackson, Marshall and Battle Creek.

I would estimate that about 20 to 30 percent of the rights-of-way have already been secured. The pipe is on order. None has been received and, as I testified yesterday, we anticipate that it will be rolling in in the next two or three weeks.

Mr. Wheat: What do you mean "rolling in"?

The Witness: Coming in on the railroad.

By Mr. Littman:

Q. Has the contract been let for that line?

A. No, the contract has not been let for that line.

Q. I assume from what you have said that the Board of Directors of Panhandle Eastern has formally approved the building of this so-called south Michigan west line?

A. Yes, the budget has been approved.

Q. Work orders have been issued?

A. Yes, work orders have been issued.

Q. Now, this line will serve new markets, that is, markets heretofore not served by Panhandle Eastern?

A. That is correct.

Q. And generally, those markets include the cities of Jackson, Michigan; Marshall, Michigan; Battle Creek, Michigan, and Kalamazoo, Michigan?

A. That is correct.

Q. Are there any others?

[fol. 6027] A. The outlying villages and towns already connected to the distribution systems originating in those towns that you just named.

Q. Which of these cities are now served by Consumers Power Company?

A. Jackson and the outlying towns; Marshall and the outlying towns, and Kalamazoo and outlying towns.

Q. What arrangements have been made with the distribution company serving Battle Creek?

A. The contract has been entered into covering service to Battle Creek, Michigan.

Q. What is the name of the distributing company there, do you know?

A. Battle Creek Gas Company, I believe it is.

* * * * * * * * *

Q. What revision, if any, have you made in your estimate of that line since you last testified in this proceeding?

A. The original budget called for an expenditure of $1,564,000. The figure I testified to here in the fall was [fol. 6028] $1,766,000. That has been revised to $1,719,480.

Mr. Culton: The contracts have not yet been let?

The Witness: No.

Mr. Culton: Therefore, it is subject to revision either way as the contract price may require?

The Witness: That is correct.

By Mr. Littman:

Q. Are there any further details that you can give us with respect to the South Michigan West Line that would be enlightening?

A. Yes. The 12-inch pipe required to build the section between Battle Creek and Kalamazoo has already been delivered and is stacked along the right-of-way at strategic points.

Q. When do you expect to have this new South Michigan West Line in service?

A. The South Michigan West Line should be completed by the late summer of 1942.

Q. Now, the next item shown in Exhibit 47 is "Telephone Line East" in the amount of $522,800, which appears in Line 12. What is the status of that proposed capital addition?

A. There has been no further work done on that estimate.

Q. Has there been any work done on it?

A. None other than the estimate that was reflected in my working papers. Of course, you understand that at the [fol. 6029] moment it is difficult to get copper and this line will require copper so it follows that if that work is done this year, it is quite possible that the cost will be revised, probably primarily due to the increased cost of copper and to increased cost of labor and so forth which we are feeling the effect of now in connection with other work.

Q. But at the present, you have made no revision of your original estimate which appears in Column B of Exhibit 47 in the amount of $522,800?

A. No, I have not.

Q. Now, you testified in your direct examination that you contemplated extending the present telephone system across the States of Missouri and Illinois in connection with the looping program, is that right?

A. I stated the fact that when the loops are complete from Louisburg station eastward to Dana, that it will be necessary to establish a better communication system than is now existing between our eastern stations and the main office at Kansas City.

Q. You have a complete telephone system, do you not, in Kansas? A. Yes.

Q. And in Texas?

A. That is correct and it connects with each and every station, each and every warehouse at various strategic [fol. 6030] points in the field and to the Kansas City office.

We are in complete communication at all hours of the day with the system from Louisburg station west, including both fields.

Q. Both gas fields? A. Correct.

Q. But you do not have a telephone system in the States of Missouri and Illinois, is that correct?

A. That is correct.

Q. And this capital addition comprehends the completion of that telephone system, is that correct?

A. That is correct.

Q. Are you depending now on commercial telephone and telegraph lines for your service in the States of Missouri and Illinois?

A. Yes, we are.

Q. Now, with respect to this item for "Telephone Line East", has the management approved the estimate?

A. The estimate has been discussed with the management. I cannot say that it has been approved because it has not been presented to the Board. We look to the Board for approval of the budgets, you might say.

Q. And that approval has not yet been given?

A. No, it has not.

Q. Will it be necessary to acquire certain rights-of- [fol. 6031] way in connection with the building of this line?

A. Yes, indeed.

Q. And those have not been undertaken?

A. No, sir.

Mr. Culton: Just a moment. In that connection, your rights-of-way for the pipe line give you the right to use a telephone line right along the pipe-line right-of-way?

The Witness: In many instances, but there are cases in Missouri and Illinois where that provision was not written into the pipe line right-of-way contracts.

We also probably will be able to lease pin space on other telephone lines.

Mr. Wheat: You mean the usual joint-pole operation with other companies operating pole lines in the vicinity?

The Witness: That is correct.

Mr. Culton: Pardon me, Mr. Littman, one further question. In the event Panhandle Eastern succeeds in obtaining the Michigan Gas Transmission Company, will that resulting situation be of any importance in connection with this telephone line matter?

The Witness: Indeed it will, because if we attempt to operate that line from our present headquarters, it will be necessary that we build the telephone line on through

the States of Indiana, Ohio and Michigan to the city gate of Detroit.

On the other hand, if an office is maintained in Detroit [fol. 6032] or at some other point on the Michigan Gas Transmission system, that office, in turn, will have to be in close contact with our Kansas City office and with the field operations.

Mr. Culton: Is that for the purpose of keeping proper pressures along the entire line?

The Witness: That is true.

I do not care to make any statement in connection with the way these two properties now are being operated, and I do not want that to be construed as being the way they should be operated if separate.

Mr. Culton: Suppose, if there is no objection, that you tell us what has to be done in order to maintain the pressures from one end to the other, just what the problem is and how the problem is to be handled?

The Witness: We have what you call a gas dispatching office at Kansas City. The chief dispatcher makes certain observations on the then existing load on our system.

The weather predictions he has telegraphed to him and various information concerning the estimates of requirements of customers on the system and through his experience, he is able to determine if there is need for more gas to be turned on in the field and if pressures should be raised over the system or at certain points on the system.

The dispatcher then issues certain instructions to the various compressor stations and to the field headquarters.

[fol. 6033] These instructions are to indicate whether or not more gas is to be turned on or off, or whether or not the pressures are to be raised or lowered.

Mr. Culton: Right there, does he have a chart showing what the pressures are at all the various points on the system during the day?

The Witness: He has a complete tabulation of the pressures which have been reported to him, not only during that day but all of the days previous on the western end of our system.

Those pressures are called in over our company-owned telephone system every hour and on the east end of the system, including some points on the Michigan Gas Transmission system, the pressures have been telegraphed in in a staggered form so that we have information every hour but not every hour for each and every station.

The effect of his order is watched carefully to see that the pressures do respond in the manner that he has contemplated and the deliveries through various points of measurement are also observed.

Mr. Culton: One more question. Suppose those pressures do not respond regularly.

The Witness. Then he takes what he considers the necessary additional steps—

Mr. Culton: (Interposing) To find out what is wrong?

The Witness: To find out first what is wrong and to cor- [fol. 6034] rect the same.

Early this month, we had the unusual experience of interrupting certain industrial customers that had never previously been interrupted or curtailed.

Mr. Littman: You are referring to industrial customers?

The Witness: That is correct, and the dispatcher and his staff were busy day and night keeping track of the load and its response to increased pressures, decreased deliveries to certain indutrial customers and to like matters.

By Mr. Littman:

Q. The next item is shown in Line 13, "Lateral Lines", in the amount of $254,200.

Now, that line is the lateral which you contemplate building to Bloomington, Illinois?

A. That is correct.

Q. Does it include any other lateral?

A. No, sir.

Q. Where is it proposed that this lateral line shall connect with the main line?

A. The proposed Bloomington lateral line originates on the Peoria lateral and at a point on the Peoria lateral due west of Bloomington, Illinois.

The line proceeds eastward for a distance of some 29 miles to the city gate and it is to be built of 8 inch pipe.

[fol. 6035] Q. What stage has been reached in the construction of this line?

A. In so far as I know, we have done no further work or had no further negotiations involving the construction of this line.

Q. In other words, you have not yet passed the estimate stage?

A. No, we have not.

Q. Now, this proposed lateral line will serve a new market of Panhandle Eastern after it is built?

A. That is correct.

Q. Namely, Bloomington, Illinois?

A. That is correct.

Q. Does Panhandle Eastern Pipe Line Company have a contract with the distributing company at Bloomington, Illinois?

A. A contract has been under negotiation and, to my knowledge, has not been consummated.

* * * * * * * * *

Q. Have you any revised estimate for this lateral line?

A. No, I have not.

Q. Strictly speaking, the item should be "lateral line" rather than "lateral lines", should it not?

A. That is correct.

Q. The next item is the warehouse shown in Line 14 as [fol. 6036] "Warehouse Paola", in the amount of $7,500. Will you give us a brief description of this item?

A. The present warehouse has become inadequate for our purposes and it is contemplated that during this year we shall not only remodel the present warehouse but shall extend it to some extent.

We propose to use the old foundation and to provide ourselves with more convenient quarters by the expenditure of some $7,500.

There has been some drafting work done in connection with this, although the budget covering this item has not been yet approved.

Q. Has not yet been approved by the management?

A. That is correct.

Q. Now, this warehouse is located in Miami County, Kansas, near the Louisburg compressor station?

A. Yes, sir.

Q. I take it from your testimony that the plans and specifications for the improvement of the Paola warehouse have not yet been fully completed?

A. They are fairly well completed but, as you say, not fully completed.

Q. Before leaving the items shown for the year 1942, I would like to go back to one or two of the items in that year. What do you think the probabilities are that you [fol. 6037] will be able to secure the necessary copper wire for the building of this "telephone line east"?

A. I have no definite knowledge as to the availability of copper wire. I have read in the newspapers where certain restrictions are being placed on the purchase and sale of copper, but other than that, as I stated before, I have no exact information.

Of course, in an emergency or in an unusual situation, the line might be built of steel wire. However, copper is much preferred.

Q. Now, referring again to the proposed additions to gasoline and dehydration equipment as you have already indicated, the expenditure of the sum of $120,000 for the year 1942 will substantially increase the capacity of the gasoline plant at Liberal station, is that correct?

A. That is correct.

Q. Now, that will enable you to produce more gasoline?

A. Yes, we will produce an increased quantity of gasoline, provided we make this addition to our distillation unit; which, as I testified a while ago, was badly needed, corresponding to the increased quantities of gas which we

anticipate may come into the Liberal station due to the increased load.

Q. And that will substantially increase the revenues derived from the sale of that gasoline?

A. Depending on the price of gasoline at that time, [fol. 6038] there will be an increase in revenue.

Q. Well, you naturally would expect an increase in those revenues, would you not?

A. Yes, I believe that is a reasonable assumption.

Q. But you cannot state how much?

A. No, I cannot.

Mr. Goodman: Have you made any estimate, either you or in your department, as to the expected revenues from your gasoline plant operations?

* * * * * * * *

The Witness: We have made no studies nor estimates as to the revenue, to my knowledge.

Mr. Goodman: Have you made an estimate of the quantities of gasoline which will be derived?

The Witness: We know, roughly how much gasoline we can extract from gas produced in the Hugoton Field and gas produced in the Texas Panhandle Field.

Mr. Goodman: What are those quantities?

The Witness: The Texas Panhandle runs in the order from 350 to 400 gallons per million cubic feet. The gas in the Hugoton Field, as I remember, runs in the order of [fol. 6039] 300 gallons per million cubic feet.

By Mr. Littman:

Q. Now, Mr. Burnham, do you expect all of these capital additions which you have set forth under the heading for the year 1942 to be installed in that year in the light of present conditions and bearing in mind that when you first submitted this estimate; you did so some months ago?

A. Yes, I do.

Q. You still expect each and every one of these items to be installed this year? A. Yes, I do.

Q. Now, is that a reasonable expectation or is it a hope on your part that they will be installed?

A. As you just previously stated, bearing in mind that there may be some difficulties getting materials; bearing in mind that some of these contracts, particularly the contract for the Bloomington line may not be consummated, I believe that it is a very reasonable assumption that we shall do all this work in the year 1942.

That is all based on the fact that during the past few weeks, it was demonstrated in no uncertain way that we do need these main line additions and we do need the additions to our gasoline and dehydration plant; that we do need the telephone line east or will need it.

It is also to be remembered, too, that a great deal of this [fol. 6040] work is already under construction. That particularly concerns the items shown under the year 1941.

Q. But does not refer to the items shown in the year 1942 with the exception of the South Michigan West Line?

A. That is correct.

Q. That is the only item for 1942 involving actual construction at this time?

A. That is correct.

Q. Now, passing to the items shown for the year 1943, the first which is shown in Line 17 is "Additions to Compressor Stations" in the amount of $3,482,800, will you state the nature and description of these contemplated additions, their locations and amounts for each?

A. The looped lines will have been completed by the fall of 1942 and, therefore, additional capacity can be made available in 1943 by the installation of more compressor units in various compressor stations up and down the system.

The expenditures in 1943 as shown in Line 17, involve the installation of two 1,300 horsepower Worthington gas engine driven compressors at Tuscola compressor station;

Two 1,300 horsepower similar units—

Q. (Interposing) Will you please give us the amounts as you go along, or would it be more convenient for you to give those later?

A. The total amount has not been revised, so I would [fol. 6041] much prefer to refer to the total. However,

I do have the details of each one here if you wish to have them read to you.

Q. Yes, I think we ought to have the amounts for each if you are able to give them to us.

A. They are in my working papers that you handed me yesterday, so I will have to refer to them.

The estimated cost of the addition to Tusola compressor station is $364,000.

Q. Now, that includes the cost of the equipment plus the cost of installation?

A. Including also the cost of extending the building; extending the cooling tower; installing the necessary pipe, valves and fittings to accommodate these two new units.

Q. Wherever the work involves the extension of the building and so forth, I wish you would please state it as you go along.

A. Very well.

As I was about to state, the work to be conducted in 1943 involves the installation of two similar units as those to be installed at Tuscola at Pleasant Hill compressor station.

In addition to the installation of the two 1300 horsepower compressor units at that station, the building must be extended; the cooling tower enlarged; the necessary pipe; valves and fitting installed.

[fol. 6042]. The total cost of the addition to Pleasant Hill station is estimated at $358,800.

Centralia station is the next station on the system that must be enlarged to take care of the increased requirements for the winter of '43 '44.

Three 1300 horsepower units will be required at this compressor station involving, among other things, an extension to the building; the enlargement of the cooling tower; the total cost of which is estimated at $526,500.

Q. Did you state that these compressor engines were Worthington engines? A. That is correct.

Q. What type of engines are these?

A. The engines are twin tandem horizontal engines direct connected to the compressor cylinders.

Q. That is true of all the engines involved in the 1943 construction? A. That is true.

Q. Will you please proceed with your description?

A. At Houstonia station, we shall require the installation of two 1300 horsepower Cooper-Bessemer gas compressor units of similar type to those mentioned in connection with the three eastern stations.

The installation of these two units at Houstonia will involve, of course, the extension of the main building; the [fol. 6043] extension of the cooling tower; the installation of various valves, fittings and certain pipes. The cost is estimated at $351,000.

At Louisburg station, the increased load to be experienced will require the installation of two 1000 horsepower Cooper-Bessemer units and will involve also the extension of the main building; certain additions to the cooling tower equipment as well as changes in the pipe, valves and fittings.

We estimate this cost at $280,000.

At Olpe compressor station, we shall have to install three 1300 horsepower Worthington units.

Q. What horsepower?

A. Three 1300 horsepower, making a total of 3900 horsepower and which will involve an addition to the main building; an addition to our cooling tower equipment; and changes in the yard piping, involving the installation of a considerable quantity of new pipe, including valves and fittings.

Q. What is the amount?

A. I beg your pardon, the total amount which we estimate will be required at Olpe compressor station is $487,500.

At Haven compressor station, we shall require the installation of three 1300 horsepower Cooper-Bessemer units which will also involve a substantial addition to the main building; an increase in our cooling tower capacity, as well [fol. 6044] as the installation of certain valves, pipe and fittings to accommodate these three new units.

The total cost of this addition is estimated at $487,500.

At Greensburg compressor station, there will be installed three 1300 horsepower Cooper-Bessemer units involving a substantial addition to the main building, to the cooling tower, and to the existing yard piping. The total cost of this addition is also estimated at $487,500.

At Liberal compressor station, one new 1000 horsepower Cooper-Bessemer unit will be required. The main building will be extended and certain additions will be made to the cooling tower equipment as well as to the piping and valves in the yard. The total cost of this addition is estimated at $140,000.

I believe that the sum of the figures that I have just testified to give us the total on Line 17, namely, $3,482,-80).

Q. Yes. These are the only additions for the year 1943 which would affect the capacity of the system, is that correct?

A. Assuming that the gas will be made available at Liberal compressor station, that is correct.

Q. Now, what do you expect to be the capacity for 24 hours of your system after these 1943 capital additions are installed?

[fol. 6045] A. We shall have a peak day sales or delivery capacity of 355,800,000 on a 24-hour basis.

Mr. Culton: That would give a little leeway on Mr. Morton's estimate of 343 million. In other words, you will be on the safe side for his 343 million peak in 1943?

The Witness: I think you should refer to his 1944 peak. The 1943 peak that he has estimated will occur during the winter of '42-'43.

Mr. Culton: Would you still be able then to take care of his peak in 1944 of 367 million?

The Witness: We designed for Mr. Morton's peak after having deducted certain readily interruptible gas.

Mr. Culton: After taking care of the interruptible, you will be able to take care of the 367 million?

The Witness: That is correct.

By Mr. Littman:

Q. You testified yesterday, Mr. Burnham, that the installation of the capital additions set forth in Exhibit 47 for the year 1942 will bring your total 24-hour capacity to 330,000 M.c.f.

Now, do I understand that the addition of all of this compressor station equipment and additions for the year 1943 will only raise that an additional 24,800 M.c.f. per 24 hours?

A. That is correct, with the possible exception that the record shows that we will have, at the end of 1942, a ca- [fol. 6046] pacity of 331 million rather than 330 million.

Q. In other words, the expenditure of $3,482,800 for additional compressor station equipment and facilities for the year 1943 will raise or increase the 24-hour capacity of the system by 24,800 M.c.f.?

A. That is correct.

Q. What stage has been reached in the construction of the additions to the compressor stations set forth in your Exhibit 47 for the year 1943?

A. They are only in the estimate stage.

Q. Have those estimates yet been submitted to the management?

A. Only in so far as the papers and estimates in connection with this rate case have, of course, been available to the management.

Q. The next item for the year 1943 is, "Additions to Gasoline and Dehydration Equipment". Will you give us a description of that item?

A. That item involves the new distillation unit in regard to which I was testifying a moment ago.

We are debating whether or not that distillation unit should be installed in the year 1942 rather than in the year 1943 so the money there involves the distillation unit referred to previously as well as the necessary additional contractors and the increasing of our pumping equipment at [fol. 6047] the gasoline and dehydration plant, as well as other necessary changes involved in taking care of the increased quantities of gas which must necessarily be treated in this plant.

Q. Has this item passed the estimate stage?

A. No, it has not.

Q. And the estimates have not yet been submitted to the management except for rate-making purposes?

A. No, I would say that it has gone a little farther than that. We have discussed the matter very seriously with Mr. Neuner, Vice President in charge of operations.

Q. But it has not yet been submitted to the Board of Directors for approval?

[fol. 6048] A. No, it has not.

Q. Now, going to the year 1944, you show in Line 24 of your exhibit 47, an item entitled, "Additions to Main Lines" in the amount of $6,228,600. Will you give a description of those main lines?

A. This item reflects the beginning of the construction of the third line or loops which will ultimately constitute a third line.

Our flow studies indicate that, starting at the east end of our system, we shall not need to do any looping east of Glenarm compressor station.

However, between Pleasant Hill and Glenarm stations, we shall be required to install 10.85 miles of 26-inch O. D. by 9/32 wall pipe at a cost of $30,000 a mile, amounting to $325,500.

Between Centralia and Pleasant Hill compressor stations, we shall be required to install 22.64 miles of 26-inch pipe at an estimated cost of $679,200.

Q. Are these distances which you are stating the total distances between the two compressor stations?

A. No, they are only the lengths of the new loops which will be built alongside the then-existing two lines which new loops will give us an increase in capacity sufficient to carry the anticipated loads of the winter of '44-'45.

Q. Will you designate on the map the point at which [fol. 6049] each of these loops will start and terminate?

A. As I just stated, we shall require no looping east of Glenarm compressor station to carry the estimated load. However, the load does require certain additions between Pleasant Hill and Glenarm stations and the new loop will start at Pleasant Hill compressor station.

That is the Pleasant Hill loop that I referred to a moment ago and will proceed eastwardly for a distance of 10.85 miles where we now have a main line gate valve installed with the proper interconnections which will make it possible to tie in the end of this new loop and to put it into operation immediately upon the completion of that construction.

That new loop, as I have just stated, will permit the transportation of additional quantities of gas between Pleasant Hill and Glenarm station which additional quantities will be required, according to our studies.

Q. How much additional gas will you be enabled to transport between Pleasant Hill compressor station and Glenarm compressor station by the addition of this 10.85 miles of 26-inch pipe?

A. In round numbers and giving consideration to the fact that we are going to put in another 1000 horsepower unit here at Glenarm compressor station during that same year, approximately 20 million cubic feet per day.

Q. Now, will you give us the same information for the [fol. 6050] Centralia loop?

A. The Centralia loop will originate at Centralia compressor station. It will proceed eastward for a distance of 22.64 miles, paralleling the existing double line out of that station and will be tied in at its eastern terminus to a now-existing main line gate valve and upon completion of that construction will be put into operation immediately.

The effect of building that loop between Centralia and Pleasant Hill will increase our capacity in round numbers, as I stated before, some 20 million cubic feet per day.

Q. And the estimated cost of this particular loop is $679,200? A. That is correct.

The next loop that will be required will be between Houstonia and Central compressor station and will originate at Houstonia compressor station and will proceed eastward for a distance of 27.25 miles where it will be tied in to the existing double line and will thereby increase our capacity, in round numbers, between 20 and 25 million cubic feet per day.

Q. What is the estimated cost of that line?

A. The estimated cost of that line is $785,182.

Q. Will you give us the next one?

A. The next loop which we will require will be a rela-
[fol. 6051] tively short one and will lie between Louisburg and Houstonia compressor stations.

* * * * * * * * *

Q. What is the estimated cost of that line?

A. The estimated cost of that line is $261,139

Q. What is the estimated increase in capacity between Louisburg and Houstonia compressor stations by reason of the building of that loop?

A. The capacity will be increased, considering the fact that we will install some additional power at Houstonia compressor station during the same period, in round numbers, between 20 and 25 million cubic feet per day.

* * * * * * * * *

[fol. 6052] Q. Will you proceed with your description of the additions to main lines for the year 1944?

* * * * * * * * *

A. The next loop required lies between Olpe and Louisburg compressor stations. It involves the construction of 23.7 miles of 26-inch pipe at an estimated cost of $680,451.

* * * * * * * * *

Q. What additional amounts of gas will the installation of this loop enable you to carry?

A. In round numbers, approximately 25 million cubic feet.

In this loop there is involved a new river crossing at the Neosho River some ten miles east of Olpe compressor station. We propose to build in this new river crossing four 16-inch submerged lines.

The total length of the river crossing is 3.42 miles and its cost is estimated at $209,988.

[fol. 6053] The next loop to be built lies between Haven and Olpe compressor stations and involves the construction of 41.02 miles of 26-inch pipe line.

This loop will originate at Haven compressor station. We will cross the Arkansas River a short distance from the station and it will be tied into the existing double-line system at a terminus some 41 miles east of the station.

The total cost of this loop is estimated at $1,263,621.

Involved, also, in this loop is a new river crossing at the Arkansas River. It will be constructed of four 16-inch submerged lines, the distance from header to header being 1.13 miles.

The total cost of this river crossing will be $69,382.

The next loop lies between Greensburg and Haven compressor stations.

Q. Before going to the next loop, will you please state the amount of additional gas that will be enabled to be transported between Haven and Olpe stations by reason of the new loop?

A. The additional gas will be in the order of 30 million cubic feet per day.

The next loop to be constructed will lie between Greensburg and Haven compressor stations and will consist of 34.36 miles of 26-inch pipe.

It will originate at the Greensburg station and will pro- [fol. 6054] ceed westward and will be tied in at its terminus into the existing double-line system.

The total cost of this loop is estimated at $1,013,606.

Q. And what is the additional amount of capacity by reason of this loop?

A. Roughly the capacity will be increased by approximately 30 million cubic feet.

The next loop to be constructed will lie between Liberal and Greensburg compressor stations and will involve the construction of 31.82 miles of 26-inch pipe line at a cost of approximately $940,535.

This line will originate at Liberal compressor station and will proceed eastward for the distance mentioned where it will be tied into the existing double-line system. The increase in capacity which will result from the con-

struction of this loop will be approximately 30 million cubic feet per day.

Q. Does that complete your item shown in Line 21 of Exhibit 47? A. It does.

Q. Will you go to the next item which is shown in Line 22, "Additions to Compressor Stations" for the year 1944?

A. During this year it is possible to take advantage of some of the power that we estimate will be installed the previous year.

[fol. 6055] In other words, we are balancing the pipe on these loops against the power previously installed and it will be necessary to build only three compressor station additions during the year 1944.

Q. Now, where will those be built? Please give us a description of the additions.

A. Starting at the east end of the main line system, we shall install at Glenarm compressor station one 1000 horsepower Cooper-Bessemer gas compressor unit involving an addition to the main building, the extension of our present cooling tower equipment and the addition to certain piping in the year.

The total cost of such addition we estimate will amount to $140,000.

At Houstonia compressor station we shall install one 1300 horsepower Cooper-Bessemer gas compressor unit.

Q. And what is the estimate for that item?

A. We estimate the total cost will be $175,500. It involves in addition to the installation of the 1300 horsepower unit an extension to the main building and certain additions to our cooling tower and to the piping in the yard.

The next compressor station addition proceeding westward is that of a 1000 horsepower Cooper-Bessemer unit at Liberal compressor station involving, among other things, the extension to the main building, the extension [fol. 6056] of the present cooling tower and certain additions to piping in the yard. The total cost of these additions is estimated at $140,000.

Q. Now, that completes the estimated additions for the year 1944. I presume that none of this has passed the estimating stage, has it? A. That is correct.

Q. And none of it has been submitted to the management? A. That is correct.

Q. Who requested you to make the estimates for the year 1944 which are shown in your Exhibit 47 in Lines 21 and 22?

A. I don't recall what individual requested me to do that, but I do remember that it was my assignment when the studies were undertaken.

Q. When did you first undertake to make your estimate for the year 1944, approximately?

A. In the month of September.

Q. Of 1941? A. Correct.

Q. Had you ever previously made an estimate of capital additions for the year 1944? A. No, sir.

Q. Is it customary for you or your department to make estimates that far into the future? A. No, sir.

[fol. 6057] Q. What is your customary practice in that regard?

A. The customary practice is to make these estimates one year in advance of the required construction.

Q. That is, in the normal course of events, you, as chief engineer of the company, make estimates of capital additions for approximately one year in advance?

A. That is correct.

Q. Were you advised of the purpose of these estimates, which extended beyond the year in advance?

A. I beg your pardon?

Q. Were you advised of the purpose for which this estimate shown in Exhibit 47 was to be prepared?

A. Yes, I think I knew the purpose.

Q. What was the purpose?

A. The purpose was in order to present the data to this Commission during this rate hearing.

Q. And for this rate proceeding? A. Yes, sir.

Q. Now, am I correct in understanding that none of the estimates of capital additions for the year 1944, which are shown in your Exhibit 47, have been submitted to the management of Panhandle Eastern for construction purposes? A. That is correct.

Q. And it is, also, true of the amounts shown for the [fol. 6058] year 1943? A. That is correct.

Mr. Culton: Those have all been discussed with the President and Vice President, have they not?

The Witness: Yes. As I mentioned a moment ago, the management is familiar with our requirements through the future years due to their having examined these papers and so forth.

By Mr. Littman:

Q. And your statement to the effect that the estimates of additions have not been submitted as yet to the management of the company for construction purposes would apply to those set forth for the remaining years, to-wit, 1945 and 1946? A. That is correct.

Q. Before going to the year 1945, I wish you would state the amount of additional capacity which will result from the installation of the capital additions shown for the year 1944 in Lines 21 and 22 of Exhibit 47.

A. The capacity will be increased by approximately 25 million cubic feet per day. When I say "capacity" that means the sales or delivery capacity.

Q. Inasmuch as you have previously testified that as of the end of the year 1943 you would have a 24-hour capacity of 355,800 M.c.f., the increase resulting from the installation of the 1944 additions would result in a total [fol. 6059] capacity as of the end of 1944 of 380,800 M.c.f.?

A. That is approximately correct. The figure that I have used is 380,450 M. c. f. I am referring to the study that was made when it was determined that these loops and compressor station additions would be required in the year 1944.

Q. Now, in Line 25 you show an item for the year 1945 of "Additions to Main Lines" in the amount of $6,329,600. Will you please describe the additions embraced by that item?

* * * * * * * * *

[fol. 6060] A. Starting at the east end of the system, the first loop to be constructed will be between Tuscola station and the terminus of the line at Dana, Indiana.

It will originate at the discharge side of the Tuscola compressor station and will extend eastward for a distance of 14.72 miles and will be constructed of 26 O. D. by 9/32 wall, electric weld pipe.

Q. What is the estimated amount of that section?

A. $441,600.

Q. What is the estimated increase in capacity between Tuscola and Dana by reason of the installation of this third loop?

A. Between 40 million and 50 million cubic feet of gas per day.

Q. What is the next one?

A. The next loop to be constructed in the year 1945 lies between Glenarm and Tuscola compressor stations and will consist of 17.08 miles of 26 inch 9/32 wall, electric weld [fol. 6061] pipe and will extend from the discharge side of Glenarm station eastward for the distance mentioned where, at its terminus, it will be tied into the existing double line system.

The total cost of this loop will be $512,400. The additional capacity, considering power to be installed in both Glenarm and Tuscola stations, will be in the order of from 40 million to 50 million cubic feet per day.

The next loop will be constructed between Pleasant Hill and Glenarm compressor stations and will consist of 25.61 miles of 26 inch pipe line involving a total cost of $768,300 and will result in an increase of capacity in the order of 40 million to 50 million cubic feet of gas per day.

Q. Where does this line begin and where does it terminate?

A. The Pleasant Hill loop to be built in the year 1945 will originate at the eastern terminus of the Pleasant Hill loop constructed the previous year.

Q. Which is a point 10.3 miles east of Pleasant Hill?

A. That is correct.

Q. And where will it terminate?

A. 25.61 miles east of the eastern terminus of the loop constructed the previous year.

I think I was wrong in saying that it began—did I mention the fact that it had begun at Pleasant Hill compressor station?

[fol. 6062] Q. Will you please go to the next loop for the year 1945?

A. The next loop will be between Centralia and Pleasant Hill and will consist of 22.51 miles of 26-inch pipe line construction and will cost $675,300.

It will begin at the eastern terminus of the loop line constructed the previous year and will extend eastward for the distance just mentioned where it will be tied into the existing double-line, main line system.

The increase in capacity will be in the order of 50 million cubic feet per day.

The next loop to be constructed will lie between Houstonia and Centralia compressor stations and will involve the building of 12.16 miles of 26-inch by 9/32 wall pipe line at an estimated cost of $350,378.

Involved in this loop will be a new river crossing at the La Mine River, consisting of four 16-inch solid-welded submerged lines, extending for a distance of 1.15 miles from bank to bank or, rather, from header to header, costing $70,610. The increase in capacity involved or resulting [fol. 6063] from the construction of the Houstonia loop in connection with other loops and power to be installed will amount to approximately 50 million cubic feet per day.

The next loop to be constructed in the year 1945 will lie between Louisburg and Houstonia compressor stations and will involve the installation of 22.57 miles of 26-inch pipe at an estimated cost of $695,856.

It will commence or begin at the eastern terminus of the Louisburg loop built the previous year and extend eastward for the distance just mentioned, where it will be tied into the existing double-line system.

The increase in capacity resulting from construction of this loop in combination with the other loops to be constructed and power to be installed during the same year will be in the order of 50 million cubic feet per day.

The next loop to be installed will lie between Olpe and Louisburg compressor stations and will consist of 23.69 miles of 26-inch pipe line.

Its cost is estimated at $680,164. The construction on this loop will commence at the eastern terminus of the 26-inch loop built the previous year and will extend eastward for the distance just mentioned at which point it will be tied into the existing double-line system.

The increase in capacity resulting from the construction of this loop in combination with other loops and compressor [fol. 6064] station additions will approximate 55 million cubic feet per day.

The next loop to be constructed will be between Haven and Olpe compressor stations. It involves the construction of 24.24 miles of 26-inch by 9/32 wall pipe from the eastern end of the loop built the previous year and extending for the distance just mentioned to a point on the existing double-line system where it will be tied in and in combination with the other loop built during the same year and compressor station additions installed will result in an increase in capacity approximating 55 million cubic feet per day.

Q. What is the estimated cost of that line?

A. The estimated cost of the loop just referred to is $746,713.

The next loop involved in the 1945 construction program lies between Greensburg and Haven compressor stations and will consist of 23.15 miles of 26-inch pipe line extending from the eastern end of the loop built the previous year.

At its terminus it will be tied into the existing double-line system and the capacity of the system resulting from the installation of this loop in combination with other loops and compressor station additions will amount to approximately 55 million cubic feet per day.

It is estimated that this loop will cost $680,934.

The next loop lies between Liberal and Greensburg sta- [fol. 6065] tions and will be 23.93 miles long. It will, also, be constructed of 26-inch by 9/32 wall pipe at a cost of $707,323. The capacity increase resulting from the construction of this loop in combination with other loops built the same year, as well as compressor station addi-

tions added, will result in an increase of capacity of approximately 55 million cubic feet per day.

Q. Now, the 55 million cubic feet figure which you have just given applies to the additional capacity which will result from the installation of the main lines and compressor stations shown in Lines 25 and 26 of Exhibit 47 under the year 1945? A. That is correct.

Q. And that would bring your total capacity as of the end of 1945 to 435,450 M.c.f.?

A. Well, I am sorry, but in working this increase in sales capacity back toward the west end of our system I have mentally added a small amount to cover compressor station fuel.

If you will note, I started off stating that our capacity on the east end of the system will be increased in the order of 50 million and, as I worked backwards down the system I added a small amount for fuel.

I might give you the total figure which represents the sales capacity which will result from the building of all [fol. 6066] these loops and the compressor station additions in regard to which I am about to testify.

The total sales capacity or delivery capacity in the year 1945 at the completion of the construction program for that year will be 429,900 M.c.f.

Q. That is an increase of 49,450,000 cubic feet over the previous year's capacity?

A. That is correct.

Q. Now, the next item shown for the year 1945 is "Additions to Compressor Stations", in the amount of $627,500. Will you describe those capital additions?

Mr. Goodman: Before you answer that question, if I may interrupt, I require some clarification here as to what you mean by your figures for total sales capacity.

I wonder if you don't mean the maximum day?

The Witness: The sales capacity, of course, is involved with maximum day.

Mr. Goodman: In other words, that is the figure for your maximum day delivery capacity. That is what you mean, isn't it?

The Witness: That is correct, on a continuous basis.

Mr. Goodman: I understand. That is all.

By Mr. Littman:

Q. Well, Mr. Burnham, Mr. Morton estimated in Exhibit 40 that the peak day requirement for the year 1945, [fol. 6067] which means the winter of 1944, is 392,450 M.c.f.

Now, you will have installed, as of the year 1945, 429,000 M.c.f. Is that correct?

A. No, I cannot agree with you. Mr. Morton's peak day estimate of some 392,450 cubic feet is his estimate under the year 1944 and that is the peak day which will be experienced in the winter of 1943.

Wait a minute. It occurs under the column "1945" and that will be the peak day experienced during the winter of 1944-1945.

Q. That is shown in column "G" of Exhibit 40, is it not?

. . . . . .

Mr. Wheat: Isn't it a fact that during the year 1945 you have to prepare for the peak of the winter 1945-1946?

The Witness: That is the correct answer, you might say.

. . . . . .

Mr. Wheat: And that is why you would necessarily during the calendar year 1945 raise your capacity to a greater amount than is shown on Exhibit 40 of the Witness Morton in Column "G" under the heading "1945" which means the winter of 1944-1945. Is that true?

[fol. 6068] The Witness: That is correct.

By Mr. Littman:

Q. In other words, if I correctly understand your testimony, you are installing capacity by way of additions to main lines, compressor stations and so forth in the year 1945 in order to meet Mr. Morton's estimate shown in Column "H" of Exhibit 40 for the year 1946, to-wit, 441,900 M.c.f.?

A. That is correct.

Q. It doesn't look like you are going to meet it, does it, according to this estimate of 429,900 M.c.f. which you stated was going to be the total sales capacity installed by your capital additions through the year 1945?

A. Mr. Morton's estimate of the peak day is high in the sum of 12 million cubic feet of gas which we consider as readily interruptible.

In other words, it is being sold to industrial plants that can use other fuel and for that reason we do not design capacity to carry such a load as that over the peak day periods.

You will find that true for each of the winter periods that I have just been testifying to.

Q. In other words, your capital additions are installed with a view to meeting the non-interruptible gas, that is, the household gas, industrial and domestic requirements of the system and not the interruptible industrial load?

A. More properly it might be defined as not the highly [fol. 6069] or readily interruptible industrial load. We have industrial contracts with industries which are now engaged in the manufacture of material made for war purposes and we do not consider them highly interruptible although the contract does permit the interruption or curtailment of supplies of gas to these industries.

Now, therefore, we have in these studies reflected the effect of interrupting only those industries which can readily change over to some other form of fuel.

* * * * * * * * *

[fol. 6070] Q. Mr. Burnham, you have not given us the description of the additions to compressor stations for the year 1945 shown in your Exhibit 47 in Line 26 in the amount of $637,500.

Will you please proceed to give us a description of those additions?

A. In addition to the looped lines which we will be required to build in 1945 in order to carry the increased demands we expect to have made on this system, we shall install at Tuscola compressor station one 1300 horsepower

Worthington gas engine driven compressor at a cost of $182,000.

This cost will include an extension to the main building in addition to the cooling tower and certain additions to the year piping.

At Glenarm compressor station—

Q. (Interposing) What is the additional capacity contemplated to be brought out by the installation of that one [fol. 6071] 1300 horsepower Worthington compressor engine?

A. As I testified this morning, in combination with the loops to be built the same year and in combination with additional units to be installed in three other compressor stations, our capacity will be increased, that is, sales capacity will be increased approximately 50 million cubic feet per day.

Q. Will you proceed with the next item of compressor station additions for the year 1945?

A. At Glenarm compressor station, we shall install one 1000 horsepower Cooper-Bessemer unit and, at the same time, extend the main building and make certain additions to the cooling tower and yard piping.
